**PRAGMATISM** (22.246).—Assuming that the article in the 11th Edition of the *Encyclopædia Britannica* has sufficiently outlined the rise of pragmatism and its history to the end of 1909, it remains to trace its subsequent developments in the years that have since elapsed. In Aug. 1910 the pragmatist movement suffered a great loss by the death of its most effective and persuasive initiator, William James, though for a number of years his works continued to appear or to be re-issued posthumously, from 1911 down to his fascinating *Letters* (2 vol., 1920).

Moreover, the period under review was not in general favourable to the progress of philosophic reflection. For the first few years no doubt philosophic discussion proceeded upon normal lines, with pragmatism attacking absolutism and various sorts of realism assailing idealism, while these stood on the defensive and for the most part entrenched themselves behind their past achievements. At the fourth International Congress of Philosophy at Bologna in 1911 the announcement of Vaihinger's "Philosophy of the As If" brought a valuable reinforcement to pragmatism, because it showed how greatly the use of "fictions" conduced to the making of "truth."

*Effects of the War.*—But the outbreak of the World War in 1914 soon had a paralysing effect, in philosophy also, on the progress of thought, and substituted propaganda for impartial inquiry, incidentally having some effect in impairing the vogue of German idealism. Philosophically the years of the War are nearly a blank in Europe, though research continued in America while America remained neutral. After the War the chief intellectual sensation, the verification of Einstein's theory of Relativity, was scientific rather than philosophic and though some philosophers intervened in its discussion, it was not a very suitable subject for philosophic acumen. It really arose out of a highly technical problem of physical measurement and established its conclusions by very stiff mathematics. Still the discredit thrown by this successful revolution in physics on the absolutes of measurement and on the familiar abstractions of space and time, could not but dispose men's minds more favourably towards the complete philosophic relativity implied in the pragmatic conception of truth, and proclaimed so long ago in Protagoras's dictum that "man is the measure of all things." In central Europe also the overthrow of so many highly authoritarian social orders had a considerable effect in unsettling rigid ideas and proved conducive to a loss of complacency and to greater open-mindedness in academic circles. On the other hand economic conditions and the state of the book trade put great difficulties in the way of the publication of books that had little or no popular appeal.

On the whole, therefore, it would be absurd to contend that philosophy in general and pragmatism in particular had made any marked progress in the period under review. Still some

progress was made, rather of an unobtrusive sort, under all the four headings under which the influence of pragmatism has made itself felt.

*Psychology.*—In psychology (*q.v.*) the "boom" in psychoanalysis (*q.v.*) and in psychotherapeutic methods generally, which is directly traceable to the necessity under which many theoretic psychologists found themselves of either finding useful applications of their knowledge or going into the trenches, was a good example of the powerful impetus which scientific practice can give to scientific theory. But otherwise it can hardly be said to have developed or even affected, pragmatic doctrine. Two other movements were more important. In the first place "behaviourism," though it is easily beguiled into explaining away the existence of mind altogether, at any rate makes it quite clear that action rather than speculation is the mind's essential characteristic; so it is no wonder that (in America) many pragmatists, and notably Dewey, have shown themselves decidedly sympathetic towards behaviourism. Secondly, under the leadership of W. MacDougall (*Outline of Psychology*, 1923) there is arising a school of psychologists who stress the biological significance and teleological character of mental life, and so naturally ally themselves with the pragmatic logicians who protest against the ignoring of the purposiveness of thought in the traditional logics. The interdependence of logic and psychology is thus once more attested, as it is by F. C. S. Schiller's study of the psychology of belief, *Problems of Belief* (1924) which is fitted to form a popular introduction to the whole subject.

*Logical Aspects.*—It is, however, to the logical aspects of their doctrine that the chief pragmatists devoted most attention, and the fruitfulness of their inquiries showed that it was a mistake to take the disparagement of logic indulged in by both James and Bergson as meaning more than a distaste for the futilities of intellectualistic logic (*see* LOGIC.) Dewey on the other hand has a long list of logical works to his credit. *How we think* was a brilliant little introduction to logic and, with *The Influence of Darwin on Philosophy*, came out in 1910. *Essays in Experimental Logic* followed in 1916. *Creative Intelligence* by Dewey and seven of his friends and pupils (1917) was also largely logical in its interest, as were most of his abundant contributions to periodicals. Finally in 1925 Dewey brought out in *Nature and Experience* a full and systematic exposition of his philosophy which, though as a whole it may perhaps be best classed as metaphysical, includes also a magisterial description of the nature and functions of thought. Shortly before (in 1923) C. S. Peirce's early papers (which had long been unprocurable) were collected and brought out under the title *Chance, Love and Logic*.

Alfred Sidgwick continued to hammer away at logic, following up his *Application of Logic* (1910) by an *Elementary Logic* (1914), which treats the traditional logic frankly as just a game with syllogisms. F. C. S. Schiller set himself to elucidate the notions of "error" (which he holds no formal logic can discriminate from "truth") in the Proceedings of the Aristotelian Society 1910-1, and of "relevance" (which he regards as the essential condition of truth rather than all-inclusiveness) in *Mind* (1914), and to show that the possibility of defeating any universal rule by misapplying it to a special case (from which Sidgwick had deduced his fatal objection to the validity of the syllogism owing to the latent ambiguity of the middle term when any syllogism was used) had already been recognised by Aristotle in certain cases. In his *Formal Logic* (1912) he produced a systematic criticism of the traditional logic, and traced all its embarrassments to its abstraction from real meaning, *i.e.*, to its substitution of the meaning of the words for the meaning of the man who used them, so that strictly speaking logic turned out to be a meaningless science, though in practice its doctrines all oscillated between verbalism and psychology. He also emphasised the divergence between logical theory and the actual procedure of the sciences in two contributions to Singer's *Studies in the History and Method of Science* (*Scientific Discovery of Logical Proof*, 1917 and *Hypothesis*, 1921), but has not so far produced the systematic reconstruction of logic on voluntarist lines to which he is pledged.

In face of these criticisms the intellectualist logicians thought it best to wrap themselves in a disdainful silence and to re-state their former doctrines. Thus F. H. Bradley, in the second edition of his *Principles of Logic* (1922) reprinted his original text with annotations and terminal essays, in which he admitted that he had fallen into the errors of the copy-theory of truth, but only to give his adhesion to the coherence view and to represent logic as concerned exclusively with the "all-embracing" judgment and the "self-developing" inference. This doctrine, however, proved difficult to carry through in face of the entanglement of logic with psychology, and he had to admit that "logic, being abstract, has, in order to exist, to take place in a world of psychical irrelevancy" (p. 616), and to relegate to metaphysics the task of how the logical ideal of all-inclusiveness could be rendered compatible with its actual recognition of relevance and the practice of selection. No wonder there remained a final doubt "as to how far in logic the claim of logic is made good" (p. 601). Moreover in his *Essays on Truth and Reality* (1914) which are full of covert polemics against pragmatism, he had been driven to make so many concessions that, as Schiller pointed out (in *Mind*, July 1915), the line separating him from pragmatism had become invisible in many places, while the absolute had been reduced to a merely honorary position.

*Ethical Aspects.*—In the field of ethics the pragmatists have not been very active. Dewey's *Human Nature and Conduct* (1922) is almost the only notable publication. It is a systematic application of pragmatic principles as conceived by him, to the theory of conduct, and is full of memorable sayings. But L. P. Jack's writings also, though not academic in form and often cast in the form of parable and fiction, and especially his *Alchemy of Thought* (1910), are excellent pragmatism, with a strong moral flavour.

*Religion and Pragmatism.*—As regards religion the chief pragmatist writers on the psychology of religion passed away with William James and Theodore Flournoy, and the otherwise very active school of Dewey somewhat conspicuously neglects this branch of pragmatism. On the other hand it can hardly be disputed that pragmatism has shown that up to a point the procedure of the religious consciousness is everywhere pragmatic, and all writers on religion are now much more ready to recognise this fact. As good examples of the religious influence of pragmatism I. King's *The Development of Religion* (1910) and E. S. Waterhouse's *Philosophy of Religious Experience* (1923) may be mentioned.

*Conclusion.*—In general pragmatism may now be said to have established itself as a definite method and permanent attitude towards the problems of philosophy which, though still resisted and resented in academic circles biased in favour of intellectualism by their mode of life, is never likely to disappear again completely and under some social conditions *e.g.*, in a country, like America, where the academic man is not allowed to seclude himself and to lose touch with life altogether, is even likely to become predominant. It has also made good its claim to be the correct account of a natural and widely prevalent method of knowing, though its opponents do not of course admit that it is the only method, or the best. This is admitted even by the more modern sorts of absolute idealist (Croce, etc.) who, like Bergson, are willing to concede science to pragmatism, though they still maintain that philosophy can attain to absolute truth by "pure" thought. This compromise should perhaps satisfy the pragmatists, in view of the continued success of scientific knowing and its growing control of human activities and of the increasing self-refutation of "pure thought" by the dissensions of its exponents. Controversy has in consequence largely died down, and the accounts of pragmatism given by non-pragmatists are no longer the grotesque caricatures they were, and are becoming quite intelligent and trustworthy.

*BIBLIOGRAPHY.*—(1) Posthumous books by William James—*Some Problems of Philosophy*, an unfinished introduction to Philosophy edited by his son Henry (1911); *Memories and Studies*, a collection of articles also edited by his son (1911); *Essays in Radical Empiricism*, also a collection of James's speculations on metaphysics from 1884 to 1905 (1912); *Collected Essays and Reviews* (1920);

*Annotated Bibliography of the Writings of William James*, edited, like most of the foregoing, by R. B. Perry (1920); *Letters*, edited by his son (1920). (2) Books about W. James.—R. B. Perry, "William James" in *Harvard Graduates Magazine* (Dec. 1910); Introduction by H. Bergson to the French translation of *Pragmatism* (1911); E. Boutroux, *William James* (1911), Eng. trans. (1912); T. Flournoy, *La philosophie de William James* (1911), Eng. trans. (1917); J. Royce, *William James and other Essays on the Philosophy of Life* (1911); H. Reverdin, *La notion d'expérience d'après William James* (1913); H. V. Knox, *The Philosophy of William James* (1914). (3) Histories of the Pragmatic Movement.—F. B. Muller, *De kennisleer van het Anglo-amerikaansch pragmatisme*, The Hague (1913); E. Leroux, *Le pragmatisme Américain et Anglais*, with an international bibliography (1923); J. Wahl, *The Pluralist Philosophies of England and America*, Eng. tr. (1925). (4) Books by J. Dewey and F. C. S. Schiller.—a. by J. Dewey, *Educational Essays* (1910), *German Philosophy and Politics* (1915), *Democracy and Education* (1916), *Reconstruction in Philosophy* (1921); b. by F. C. S. Schiller, *Riddles of the Sphinx*, revised ed. (1910); "Why Humanism" in *Contemporary British Philosophy*, vol. I (1924); "Psychology and Logic" in *Psychology and the Sciences*, ed. Dr. W. Brown (1924); *Tantalus* (1924); *Cassandra* (1926); *Eugenics and Politics* (1926). Dewey and Schiller have both written a large number of articles in philosophic periodicals. (5) Books by pragmatists about pragmatism.—J. Goldstein, *Wandlungen in der Philosophie der Gegenwart* (1911); A. W. Moore, *Pragmatism and Its Critics* (1911); G. Vailati, *Scritti* (1911); D. L. Murray, *Pragmatism*, with an introduction by Schiller (1912), new ed. (1925); J. E. Russell, *A First Course of Philosophy* (1913); H. M. Kallen, *William James and Henri Bergson* (1914); G. Papini, *Sul Pragmatismo*, 2nd ed. (1920). (6) Criticisms of Pragmatism.—Hon. B. A. W. Russell, *Philosophical Essays* (1910); L. J. Walker, *Theories of Knowledge, Absolutism, Pragmatism, Realism* (1910); Vernon Lee, *Vital Lies, Studies on Some Varieties of Recent Obscurantism* (1912); R. B. Perry, *Present Philosophical Tendencies* (1912); W. Caldwell, *Pragmatism and Idealism* (1913); J. T. Driscoll, *Pragmatism and the Problem of the Idea* (1915); W. P. Montague, *The Ways of Knowing* (1925). (F. C. S. S.)

**PRAGUE** (see 22.248), the capital of Czechoslovakia, became the seat of an independent national body in 1918, when the Austrian Emperor's dominions were falling away from him. It is a well-organised modern city, with a population in 1921 of 676,657, largely Czech. The German element, about 5% of the population, and German influence, are much disliked, but the business centres are bilingual, and there are both German and Czech universities and polytechnics. There are also a Czech national museum, an observatory and academy of science. The people evince great pride in the State, and in 1918 an imposing congress was held in the city, at which Czech, Polish, Italian, Rumanian, Slovak and Yugoslav deputies gave pledges of mutual support. The bishop of Prague is Patriarch of the new Czechoslovak church.

Prague has many manufacturing industries. An industrial fair is held twice a year, and a motor exhibition was revived in 1921. The Vltava river was in process of improvement in 1924; it was then navigable for vessels of 1,000 tons to Mělník, and is to be made usable for boats of 700 tons to Stěchovice. A programme for the improvement and extension of the railways was passed by the National Assembly in 1920, the plans include a new central goods depôt, belt lines round the city, and electrification of all lines within a radius of 50 kilometres. The line to Bratislava has been double-tracked. It is also planned to make Prague an aviation centre for Central Europe. A concrete hangar and a lighthouse have been added to the aerodrome at Kbely, near the city.

**PRAYER BOOK.**—Since 1910 there has been a great movement for the revision of the prayer book in almost all branches of the Anglican Church.

*Scotland.*—In Scotland some suggestions were made in the Synod of 1911, when a schedule of permissible variations to, and deviations from, the Prayer Book was drawn up, and a revised text of the Scottish liturgy was authorised. In 1919 a more complete revision was undertaken by the consultative council on Church legislation, a body consisting of bishops, clergy and laity sitting together without legislative power. The result of its labours from 1919 to 1924 was contained in a series of reports.

*America.*—In America revision was inaugurated in 1913 by the appointment of a Revision Commission of the General Convention, consisting of seven bishops, seven presbyters and

seven laymen. The work had been going on continuously since then until, in 1925, the last stages were reached. A considerable number of the changes have been already ratified, and, after the ratification of the changes, approved in Oct. 1925, at New Orleans by the General Convention, in 1928 a Prayer Book according to the standard of 1928 will be published.

*South Africa.*—In South Africa two tentative alternative uses for the Communion Office were put forward. This was followed by the definite issue of an alternative liturgy, which was sanctioned for use in the province at a provincial synod held in 1924, to be used when desired by the priest and people in the parish.

*Canada.*—In Canada a new Prayer Book has been issued. It carefully avoids making any changes in the Communion Office or any changes involving doctrine, but adds a large number of services adapting the worship of the Church to the needs of the day.

*Ireland.*—In Ireland a new revision is being undertaken for which a committee was appointed in 1909.

*England.*—Proposals were made for a revision of the English Prayer Book on the accession of William III. in 1689, but they came to nothing. The subject was much to the fore between 1857 and 1863. There was an association for promoting a revision of the Prayer Book under the chairmanship of Lord Ebury, and many pamphlets were written suggesting revision. All these proposals for revision came from the more Protestant side of the Church of England, for the Tractarians of that day based all their innovations on the Prayer Book and it was desired to remove those features in it which seemed to support their claims. Revision proposals were made in 1879, but came to nothing.

The later movement for revision dates from the Royal Commission which was appointed on April 23, 1904, to inquire into "the alleged prevalence of breaches or neglect of the law relating to the conduct of Divine Service in the Church of England." The commission issued its report on June 21 1906, and recommended that Letters of Business be issued to the Convocations relative to the matters of "ornaments in the Church and the conduct of Divine Service." The Letters of Business, issued on Nov. 10 1906, stated:—

It is our will and pleasure that you do debate and agree upon the following points, *vide licet*, the desirability and the form and contents of a new rubric regulating the ornaments of the ministers of the Church, and also any modifications of the existing law relating to the conduct of Divine Service and the ornaments and fittings of Churches.

After the question of vestments and the ornaments' rubric had been considered, there were considerable discussions as to the desirability of a general revision of the Prayer Book. It was argued, on the one side, that lack of unanimity was an argument against revision, that the Prayer Book was rooted in the affections of the people and that no other book would hold together such different types of thought. This being so a schedule or supplement only was required. On the other hand, it was argued that the irregularity exercised by nearly all who were responsible for the conduct of Divine Service was a source of danger to the Church. Other parts of the Church in communion with the Church of England had found it necessary to revise; it was a strain on honest men's consciences that they could not obey the law; there was a conflict between the modern intellect and some of the Prayer Book; and there was also an inadequacy for practical needs. However, Convocation proceeded with the revision of the Prayer Book, though it was stated that it is not desirable at present to introduce into the text of the Prayer Book any changes, but they should be embodied in another volume to be sanctioned for optional use for a determined period. The work of revision went on for many years. The whole matter went through the hands of each House of Convocation separately, of the Joint Committee of both Provinces and then of each House again.

The result of this work was taken up by the Church Assembly when it was formed. A committee was appointed and the

report of the Assembly on the revision of the Prayer Book was ultimately published under the auspices of the National Assembly (N.A. 84). But when the moderate and somewhat conservative proposals which had been put forward by Convocation appeared in the fuller light of the Assembly many new factors came into consideration and different groups or parties in the Church took the matter of revision up with great keenness, so there was issued a series of new proposals. These were contained in the Green Book, issued by the English Church Union, the Grey Book, issued by a committee which was supposed to represent the Life and Liberty Movement, the Yellow Book, issued under the auspices of the Alcuin Club, an attempt to embody these suggestions in one book and some white papers, representing a still more extreme view.

*Method of Procedure.*—The method of procedure which has to be adopted with regard to Prayer Book revision in the Church Assembly is as follows: a committee was appointed consisting of members of all three Houses who have recommended the measure, with the alterations proposed as a schedule, to the Assembly. That measure went before the House for general approval and was passed. It was then referred to the House of Clergy and the House of Laity, sitting separately, for amendment. The measure, with the amendments proposed, then goes before the House of Bishops, who have to put it into the form in which it is to come before the Assembly for acceptance or rejection. No further amendment will be allowed. If it is accepted by the Assembly it must receive the assent, according to the forms arranged, of the two Houses of Parliament. It has also to receive the assent of the Houses of Convocation in order that their spiritual authority may be guarded.

The House of Clergy has suggested a large number of amendments, including two alternative forms of the Communion Office. They have also recommended Reservation of the Sacrament, not only for the Communion of the sick but also for others and the keeping a Festival of Thanksgiving for the Blessed Sacrament and one in honour of St. Joseph.

The House of Laity have contented themselves with far fewer amendments, but have requested the bishops to allow one alternative Communion Service with the optional use of vestments and of Reservation for the sick. They have expressed their disapproval of keeping a festival on the Thursday after Trinity Sunday as a thanksgiving for the institution of the Sacrament. While the House of Clergy desire an alternative book, the House of Laity particularly request that there shall be only one book in which the alterations, omissions and enrichments to the service are printed as notes or emendations to the existing service. In 1926 the House of Bishops was engaged on the work of revision.

*Reasons for Revision.*—It may be convenient to sum up the reasons for the amendment of the Prayer Book. Speaking generally, they are the desire to adapt a book which dates from 1662 to the needs of the time. In detail they are:—

1. A desire to do away with old-fashioned expressions, phrases unsuitable to the taste of the time, and statements inconsistent with modern thought. On this point there is considerable variation of opinion, many being attached even to the archaisms of the Prayer Book, others finding them difficult or even offensive.
2. A desire to adapt the Prayer Book to the changed usages of the Church which have gradually grown up, to accommodate law to custom.
3. Some desire that the Prayer Book should be revised so as to make the restoration of law and order in the Church possible. It is recognised that the existing Prayer Book cannot reasonably be obeyed in various points. It is proposed that there should be a rule of worship adapted to the present time with a reasonable latitude in the way of variations allowed, and that this should be enforced on the clergy.
4. There is a great desire to adapt the Prayer Book to the far wider religious and social aspirations of the present day. There is a great demand that religious worship should be brought much more closely into touch with the life of the people.
5. A desire felt, particularly by one party in the Church, arising from the great growth among them of sacramental ideas of worship. It is desired to give far greater opportunity for this in the new Prayer Book, and to accommodate it more closely to the traditional liturgical customs of the Church.

It may be noted that some of these desires seem, at any rate, to a certain extent inconsistent with one another. Some desire to reform the Prayer Book in order to bring to an end customs which others desire to make lawful and encourage. The problem presented represents one of considerable difficulty. The revision, which will allow the continued use of the old Prayer Book, must be looked upon as preliminary to a more complete revision when public opinion has become stereotyped. Meanwhile it may, perhaps, be stated that this difficult situation is not one which need arouse serious concern. It arises from the vigorous life and creative power of the Church, which shows itself by developments in various directions. (A. C. H.)

**PREFERENCE:** *see* IMPERIAL PREFERENCE; TARIFFS.

**PRESBYTERIANISM.**—Since 1910 the Presbyterian churches have encountered, in common with others, the obstacles and the impetus created by the World War. The gains have outweighed the losses upon the whole. Numerically, to judge from the statistics presented to the general council held at Cardiff in July 1925 the total membership of the Presbyterian churches had increased between 1913 and that date by well over 2,000,000. The precise figures are, for 100 organised churches which it has been possible to reach, 8,670,500 souls; so that, on the usual scale of estimating people under the direct influence of a Church, there are over 40,000,000 who are Presbyterian.

#### IN CONTINENTAL EUROPE

*Germany.*—In Germany the disestablishment of the churches, which followed the Revolution, has moved the Reformed section of the Church, the "Reformierte Bund," to stress its distinctively Presbyterian principles, and as its membership numbers over 600,000 souls, it is destined to exercise a powerful influence in the future reorganisation of the Evangelical churches in that country.

*Norway.*—In Norway the Evangelical Free Church, though Lutheran, is Presbyterian in temper, but the Lutheran section of the Church in Germany still adheres to its modified Presbyterian government under Consistories (*see* LUTHERANISM).

*France.*—The vigour shown by the two groups of Presbyterian churches in France, addressing themselves to the task of reconstruction after the War, and the increase due to the fresh membership in Alsace and Lorraine, where the Reformed Church, largely German, numbers about 50,000 members, have helped to vitalise French Presbyterianism. But there is a distressing dearth of ministers; in 1924 there were 148 Reformed parishes vacant. Economic conditions, which have to some extent affected the supply of clergy in most churches, have hitherto operated seriously in France, where Presbyterians do not number quite a half of the total Protestant population (900,000).

*Netherlands.*—The lack of students for the ministry is also felt in the Netherlands, though less in the smaller Reformed churches than in the Groote Kerk or national Church.

*Czechoslovakia.*—The rise of the new state of Czechoslovakia in 1918 led to an extraordinary break-away from the Roman Church; the united Evangelical Church of Czech Brethren now numbers over 250,000 adherents, one of its members being President Masaryk.

*Ukraine.*—A similar movement is reported from Ukraine, further east, where over 1,000,000 inhabitants have left the Roman and the Orthodox churches, and are being consolidated in a Presbyterian Church, largely under the mission work of Ukrainians who came back from Canada to carry on the movement.

*Transylvania.*—In Transylvania, on the other hand, the Presbyterians, like the rest of the religious minorities (*see* LUTHERANISM), have suffered and are still suffering under oppressive legislation at the hands of the Rumanian Government. The Magyar Reformed Church, with 800 ministers and about 720,000 souls under its charge, has to encounter the Rumanian prejudice against Magyars and the Greek Orthodox dislike of Protestants. The rights guaranteed by the Peace Treaty of 1918 to religious minorities are not being observed by the Rumanian Govt. and no remonstrances from outside have yet availed to check the perse-

cution of the Church. Hungarian Presbyterians in Transylvania thus suffer heavy damage by the War-settlement which brought relief and advance to their Bohemian brethren.

*Hungary.*—In Hungary itself, although the partition of the country brought about untoward religious results, the Reformed Church is still powerful both in numbers and in prestige, with over 1,000 congregations and 1,500,000 adherents. The Magyar racial problem emerges again in the position of the Magyar Reformed Church in Czechoslovakia, where about 40,000 members still keep apart from the larger Church of the country, and in the Reformed Church of Yugoslavia, where the members, two-thirds of whom (in all, about 23,000) are Magyars, lie exposed to hardships like those of their brethren in Transylvania. Possibly the racial prejudices and religious rivalries which make the situation in Transylvania and Yugoslavia so bitter at present may die down in the course of years; meantime the redeeming feature is the tenacity with which the oppressed Presbyterians maintain their faith amid a struggle in which, unfortunately, their outside brethren are unable to afford them very much practical sympathy.

*Switzerland.*—The four Presbyterian churches in Switzerland have formed a Federation of Evangelical Churches, representing 2,250,000 souls. Switzerland has felt, like most other countries, the call to re-union in organised religion, and the rise of this Federation is a first proof of the Swiss interest in unity. Since 1919 efforts have been made to bring together the Evangelical Church of Neuchâtel and the mother church from which it broke away under Godet in 1873, but the local difficulties are still insurmountable.

*Belgium.*—In Belgium the two small Presbyterian churches, the Union of Reformed Churches and the Missionary Church in Belgium, suffered heavily during the War. Together they now number 50 congregations, with 22,000 members.

*Austria.*—An even smaller group is the Reformed Helvetic Church in Austria, with its centre at Vienna, which numbers 25,000 souls, out of a total Protestant population of 260,000.

*Italy.*—The Waldensian Evangelical Church in Italy numbers only 22,633 members in 112 congregations, but its sturdy spirit is unabated; indeed since the War it has asserted itself more definitely than ever in Italian life, actually holding an Evangelical Congress at Rome itself, in 1920. Its theological college is now transferred from Florence to Rome.

*Spain.*—The Spanish Evangelical Church has but 1,000 members, a tenth of the total Protestant population in Spain, with 26 ministers and 32 congregations.

*Denmark and Sweden.*—Still fewer, though for no such reasons as in Italy and Spain and Belgium, are the Presbyterians in Denmark and Sweden, with three congregations between them and barely 400 communicants. The history of these countries seems to have marked the Lutheran form of organisation as native to their genus, as is the case with Norway.

*Russia.*—In Russia the Bolshevik persecution has reduced the Reformed Church from 25 to two congregations, which still survive in Moscow and Odessa.

*Poland.*—In Poland the Reformed Synod of Warsaw is now reduced to seven congregations, with barely 11,000 people; however, the transfer of Galicia from Austria has added a Reformed Church of three congregations and 7,000 souls.

*Lithuania.*—In Lithuania, which was mangled by the Peace settlement, the ancient Reformed Church numbers only nine congregations, with 17,527 members, but the land is politically free, and, though it is still predominantly Roman Catholic, the first national Cabinet was half Protestant in its membership.

*Greece.*—For the sake of completeness this rapid survey must note the Evangelical Church of Greece, with eight congregations and nearly 600 members, making Presbyterianism just visible in that country.

#### IN GREAT BRITAIN AND IRELAND

*England.*—In England the Presbyterian Church, with its 34 ministers and 84,638 communicants, altered the title of its supreme court in 1921 from "Synod" to "Assembly." The Synod

of the Scottish Church in England still numbers 10 congregations, with 4,360 communicants, in communion with the Church of Scotland.

*Wales.*—In Wales the Presbyterian Church has 1,492 congregations and 188,970 communicants, 382 of the congregations being English-speaking. Representatives of the Welsh Church are co-operating with the English, Irish and Scottish churches at present in the preparation of a new Hymnbook which will serve, it is hoped, for Presbyterian churches far and wide.

*Scotland.*—In Scotland the statistics of the four smaller churches are as follows: 94 ministers and 8,500 members to the Free Church, 15 ministers and 46 congregations to the Free Presbyterian Church, nine congregations and nine ministers to the Reformed Presbyterian Church and 20 congregations with 3,142 members to the United Original Secession Church. Since 1909 the two large churches, the Church of Scotland and the United Free Church, the former numbering now over 760,000 communicants, the latter 535,000, have been moving towards a re-union. The negotiations, interrupted by the War, have been resumed. The leaders of the Church of Scotland have twice gone to Parliament in order to secure Acts which might remove the scruples of the other Church; the first Act (in 1921) ratified a Constitution drawn up by the Church declaring her spiritual freedom, with Nine Articles outlining an acceptable doctrinal basis; the second (in 1925) ratified a financial arrangement between the Church and the heritors, relating to the teinds. At present the proposals for re-union are being considered, with a view to combining in a Church which is at once national and free claiming no legal privilege above any other Church in the land. The net result of preliminary negotiations is the conviction that "the 'main causes of keeping the churches apart' have been removed. The twofold stumbling block, which the state, inadvertently enough, had interposed between them, the state has once for all cleared away."<sup>1</sup> In the near future Scottish Presbyterianism will thus be able to present to the world an object lesson of Christian unity undertaken for the greater good of God's Kingdom at home and beyond the seas.

*Ireland.*—The political changes in Ireland, as the result of the War, have borne specially on the congregations in the Free State. In the north, the Assembly's College at Belfast has been strengthened. The number of congregations in the Church is now 558, with close on 110,000 communicants; and to this falls to be added the Reformed Presbyterian Church with 43 congregations and 3,427 members.

#### ON THE AMERICAN CONTINENT

*Canada.*—In Canada the United Church of Canada came formally into existence at Toronto on June 10 1925. This remarkable Union of Congregationalists, Methodists and Presbyterians, is the result of negotiations which have been proceeding since 1908, in order to cope effectively with the religious needs of the Dominion where, especially in the Far West, the ecclesiastical divisions were felt to be more than ever a weakness and a scandal. The best men in the three churches set themselves to devise a basis of union which should conserve the elements of value in the polity of the three churches, and after long, intricate arrangements, the formal bill passed the Canadian Parliament in 1924 by a majority of 110 to 58. The polity of the United Church is admittedly Presbyterian. Of the active members entering it, over 1,800 are Methodist, 1,200 Presbyterian and 89 Congregationalist. When the churches were consulted, less than 14% of the total membership voted against the proposals. Unfortunately a fragment of the Presbyterian Church has declined to follow the lead; 714 out of 4,531 congregations, mainly in Ontario, have preferred at present to remain isolated. Apart from this, the United Church has started under the happiest auspices.

*United States.*—In the United States, the Presbyterian Church has become more than ever since the War not only the largest but the most liberal Presbyterian Church in the world. She reports 9,903 congregations, with 1,830,928 communicants; in 1924 she raised for Foreign Missions alone the sum of over

<sup>1</sup> A. Martin, *Church Union in Scotland*, p. 48.

\$5,000,000 and employs now 1,600 missionaries in 15 different countries. In 1924 it was calculated that there were 2,250,000 Presbyterians in the United States, divided among this and 10 other churches which owe their separate existence to the Civil War strife between North and South, or to sectarian divisions introduced originally from Europe by immigrants, or to internal dissension. It has not yet been possible to re-unite these bodies. Efforts made during the past seven years have achieved little more than a measure of co-operation. Internally the Presbyterian Church has suffered, like most of the other American Churches, from the Fundamentalist Controversy (see FUNDAMENTALISM) which is still raging; it is an effort to commit the Church to five "fundamental" points of theology, viz., (i) the inerrancy of the Bible; (ii) the Virgin Birth; (iii) the Atonement as a Sacrifice; (iv) the Resurrection of Christ "with the same body with which He suffered;" and (v) the reality of the Lord's miracles.

*Mexico and South America.*—Besides a Presbyterian Church of over 5,000 members in Mexico, the various Presbyterian missions and churches in South America number nearly 30,000 communicants; the Scottish and American Churches are represented in the *West Indies* at present by 151 churches and over 20,000 communicants.

#### IN AUSTRALIA, AFRICA, ASIA

*Australia and New Zealand.*—In Australia a movement for re-union similar to the Canadian enterprise has been wrecked in the meantime. Both in Australia and in New Zealand the shortage of ministers is being acutely felt, in face of the increasing number of immigrants and the scattered population. Australasia reckons 127,305 communicants (including the Missionary Synod of Tahiti, New Hebrides, etc.) with 967 ministers, but the latter are insufficient for the needs of the situation.

*South Africa.*—Another failure of Presbyterianism to unite with other branches of the Church has to be chronicled in South Africa. In 1917 the Presbyterian Church inaugurated a movement for union with the Congregationalists, but the project had to be abandoned in 1921, partly on account of the colour question. Within the Presbyterian Church herself the colour question has had to be solved by the creation of the Bantu Presbyterian Church, composed of purely African natives, independent but allied. On the other hand, the Church of Central Africa came into being on Sept. 17 1924, a very fine example of union between the Church of Scotland's Blantyre Presbytery, the United Free Church's Livingstonia Presbytery and the Dutch Reformed Church's Nyassaland (Mossi n) Presbytery. The Dutch Reformed Church in South Africa with a membership embracing 840,000 white adherents, brings up the total of Presbyterians in Africa at present to a large number, proportionately; there are in all 1,768 congregations, including the various missions and 532,085 communicants. A growing spirit of co-operation is also manifest.

*India.*—In India the South United Church was formed of Presbyterians and Congregationalists in 1908; the community numbers over 240,000, and proposals have even been made for union between this Church and the Southern Indian section of the Church of England. The North United Church, also on a Presbyterian basis, arose in Dec. 1924, from the Presbyterian Church, which had received 53,000 Welsh Calvinistic Methodists from Assam in 1921, and the local Congregationalists.

*China.*—On a smaller scale the genesis of the United Church of Christ in China resembles that of the Indian and the Canadian communities. It arose in 1921 from the Presbyterians and the Congregationalists, the former numbering 87,332 members, the latter 29,000. This had been rendered possible by a previous reunion among the Presbyterians themselves; in 1918, after 11 years' negotiations, 10 different missions came together to form the Presbyterian Church in China. The combined community is now the largest Protestant Church in China.

*Korea.*—In Korea the Church, originally founded by American missionaries, has prospered rapidly, and displays a true missionary spirit; it numbers 1,266 congregations, with a Christian

community of over 200,000. But when the Japanese made Korea a province, re-naming it "Chosen," they persecuted the Christians harshly, till remonstrances from abroad induced them to adopt more equitable measures.

*Japan.*—In Japan itself the United Church of Christ, organized in 1877, has grown steadily till it now reckons 399 congregations and nearly 47,000 communicants.

#### FOREIGN MISSIONS, ETC.

The foreign missions of the Presbyterian churches embrace 660,687 communicants, with 5,308 congregations, and the native agents number 33,191 to 4,587 foreign or white agents. The number and quality of the native agents, who are claiming and exercising more and more responsibility in Church life, have increased in the last 10 years. The Belgians have, since 1921, begun work at Ruanda in Belgian East Africa; the Swiss, Dutch, French and Germans now number 484 white missionaries and 117,153 communicants in their respective fields; the English, Irish, Welsh and Scottish churches report 10,104 native helpers and 765 other agents, educational, evangelistic and industrial, with 171,373 communicants; the Canadian Church's missions include 1,249 agents and 18,000 communicants, while the American churches count no fewer than 2,675 white missionaries and 14,955 native helpers, who supervise about 323,000 communicants. The missions of the Australasian churches in the New Hebrides and elsewhere report close upon 9,000 communicants, and of their 583 agents no less than 454 are natives. Finally, reference may be made to several missions which were taken over from the dispossessed Germans at the close of the War. The heavy responsibilities of carrying them on fell upon the French and Scottish churches. But the action of the British Govt. in 1923, permitting the return of Germans into territory held by the British, has already relieved the situation in East and West Africa, and at the same time made for a renewal of harmonious relations in the mission field. (J. M.T.)

**PRESS:** see CENSORSHIP; NEWSPAPERS; PERIODICALS.

**PRESSBURG:** see BRATISLAVA.

**PRESTON, ENGLAND** (see 22.307), had a population of 117,406 in 1921 and an area of 3,964 acres. Large sums have been spent by the municipality on acquiring and improving the docks and quays. Industrial establishments have arisen in the neighbourhood of the docks, and land has been bought by the corporation for further development. The number of cotton mills has been further increased, and a large power station on the Ribble was opened in 1925. A chamber of commerce was formed in 1916. Parliamentary powers were obtained before the World War to deepen the channel between Preston and the sea, and a dredging plant was built. The work was postponed, but was finished in 1925. Much attention has been given to the health of the city and to the provision of hospitals, infant welfare centres, etc., and the death rate has fallen to an average of 15 per thousand.

**PRETORIA, SOUTH AFRICA**, the administrative capital of the Union of South Africa (see 22.309). Its population (1921) was 74,052, of whom 45,361 were whites. In 1911 the whites numbered 35,942. Pretoria ranks fourth of the cities of the Union. About a mile from the centre of the town, on a commanding position on the slopes of Meintjes Kop, are the Union Government Buildings, the finest public offices in South Africa. They were built 1910-3, from the designs of Herbert Baker, at a cost of £1,800,000, and consist of a large central semicircular colonnaded building, flanked east and west by rectangular blocks. At the junction of each wing with the central section is a domed tower, 180 ft. high, and at the end of each wing is a projecting pillared pavilion. A feature of the building is the long, low roof, with projecting eaves. The space enclosed by the building is laid out in terraces culminating in an amphitheatre. The buildings are of South African freestone, on a foundation of Transvaal granite. Government House and the residences of ministers are in the suburb of Bryntirion.

**PREVENTIVE MEDICINE** (see 18.59).—The prevention of disease is the true ideal of medicine. Its application is twofold—the preventive medicine of the community, which is generally

termed Public Health or State Medicine, and the prevention of disease or its sequelae in the individual.

*Historical Origins.*—The practice of preventive medicine had its origin in the ancient world. The Hippocratic writings testify to some great school and tradition of medicine which, sown and watered in a forgotten and unrecorded past, bore ultimately its golden fruit in the master himself, and in those who followed him—Dioles, Aristotle, and the scientific schools of Alexandria. Another harvest is represented in Pythagoras, Alcmaeon and Empedocles. Hippocrates himself was at his zenith in the golden age of Greece. He first systematised the existing knowledge of medicine and classified the causes of disease into those concerned with seasons, climates and external conditions, and those more personal causes such as irregular food, exercise, and habits of the individual. He laid stress upon the hygienic life as the great means of health and the postponement of death. Air, water, sunlight and herbs were his primary therapeutic agents. He wrote also on the "humours" of the body, and laid down the principle that the process of disease consists of its invasion of and disposition in the body combined with the reaction of the body itself in its own defence, a twofold struggle in which nature attempts to overcome disease. Thus Hippocrates taught the healing power of nature, and that the true physician should copy her methods.

Five and a half centuries after him came Galen, the famous Greek physician who lived in Rome in the days of Marcus Aurelius. He gathered up all the medical knowledge of his time, and his books fixed it so firmly that the Galenic tradition lasted through East and West for 1,400 years. It was conserved in the work of Oribasius, and thus became embalmed in Byzantine medicine; it was disguised in Syriac and Arabic translations, though happily it caught a glow from the new light cast upon it by Rhazes and Avicenna; it inspired the Italo-Sicilian school, which left its mark on European practice and education as well as in the "Regimen Sanitatis Salernitanum" (12th century). Haeser says that to every question the Galenic system had an answer, for every problem a solution, "and this spurious air of infallibility led the spirit of man in fetters for centuries, and shattered any hope of progress."

Through the Middle Ages the principles of preventive medicine were ignored, in spite of the scourges of leprosy and plague, nor did the plague tracts or the various ecclesiastical provisions against disease make for advance. Then with the Renaissance came the new learning on the nature both of health and disease, which revolutionised the whole content of medicine and gave it a fresh centre of gravity and a new outlook. At first the revival of learning in the West consisted of the diffusion—by the fall of Constantinople and the invention of printing—of Greek knowledge, and the result might well have been merely an extended presentation of Galenic doctrine had it not been for the new work of the 15th and 16th centuries. Leonardo da Vinci—whose genius suggested some of the great discoveries of modern science—and Vesalius of Padua, were followed in the 17th century by Galileo, Harvey—who discovered the circulation of the blood—Helmont and the experimentalists, and Sydenham and the great practitioners who with their contemporaries observed the relation of the seasons, of telluric conditions, and the contagion in relation to the incidence of disease. This was quickly followed by new knowledge of anatomy, physiology and pathology. Moreover, the early ideas in regard to infection and contagion which had been held by Aristotle and the two Italians Fracastor and Cardan were reinterpreted in the light of the germ theory.

At the end of the first half of the 19th century a beginning had been made in the discovery of specific organisms in diseased tissues, an illustration of which was Pollender's bacillus of anthrax. Then came the immortal work of Louis Pasteur on the causes of fermentation in 1857, on the disease of wine in 1863, on viruses in 1877, and on vaccines in 1880-2. His vision and technique, and that of Robert Koch, with his solid culture media and precise methods of identification, opened the gates of a new kingdom. They had great reward, for in trooped the long line of their successors. From 1870 to 1905 there followed that wonderful succession of discoveries which gave us the bacillus of leprosy (Hansen), the gonococcus (Neisser), the typhoid bacillus (Eberth-Gaffky), the micrococci of suppuration (Ogston), the bacilli of tuberculosis (Koch), of cholera (Koch), of diphtheria (Klebs-Löffler), of tetanus (Nicolai), and of plague (Kitasato and Yersin), all between 1871 and 1894.

In 1880 Laveran announced the discovery of the *Plasmodium malariae*, and 18 years later Manson and Ross demonstrated its relation to the life history of the mosquito. In 1878 came the trypanosoma of Lewis, to be followed by various members of its genus; in 1883 Friedländer described the pneumococcus, and four years later Weichselbaum the meningococcus and Bruce the micrococcus of Malta Fever. The last to be named in this brief review is Schaudinn's *Spirinema pallida* of syphilis, discovered in 1905. These then were the principal pathogenic representatives of that unseen world the existence of which had been long foretold. The discovery of these disease-producing germs was only the first step. In 1888 it was learned that such micro-organisms acted on the body tissues not only by their corporeal presence but by their secretion of toxins, against which the body cells reacted, defending themselves by the production of anti-toxins. (see SERUM THERAPY).

*Practical Needs.*—Concurrently with the growth of medical knowledge there was an empirical movement of practical prevention. Long before the days of Hippocrates men had sought to stem the tides of disease which threatened to overwhelm them. Even in Britain it was the ravages of pestilence in the Middle Ages—of leprosy from the 12th century, of the Black Death from the 14th, of sweating sickness in the 16th, and of cholera and smallpox subsequently—which compelled attention to the conditions which seemed responsible for these scourges. The great monastic orders and some of the historical cities—Rome, Venice and London—provided comfort, refuge and sustenance for the victims, and in 1388 was passed the first Sanitary Act in England, directed to the removal of nuisances. In 1443 came the first plague order recommending quarantine and cleansing; in 1518 was made the first rough attempts at notification of epidemic disease and of isolation of the patient; under Queen Elizabeth scavenging became more stringent; and as time passed men began to see that environment was one of the principal factors in the origin and spread of disease, and thus housing, water supply, drainage, scavenging and quarantine played an increasing part in prevention.

*Experimental Method.*—At first the new applications of medicine were suggested by medical practitioners. Three centuries ago Harvey indicated for us the true experimental method; he placed the blood in the forefront of physical life, and gave it a new chemical and physiological meaning, and by his demonstration of the circulation he provided a new conception of the method by which the blood carried its nourishment to all parts of the body. Fifty years later, Thomas Sydenham, another practitioner, living in a "generation of the strongest and most active intellects that England has produced," laid the basis of epidemiology by his observation of cases, his power of analysis and comparison, his deduction of laws of prevalence, and his suggestive hypothesis of "epidemic constitutions."

Richard Mead, a successful English practitioner in the first half of the 18th century, left behind him published works on poisons, on the plague and the methods of its prevention, on smallpox, measles and scurvy. Bradley and Rogers deduced from their general practice some of the principles of epidemiology, Fothergill described "putrid sore throat," and Heberman chickenpox. Huxham, of Totnes, became an authority on the treatment of fevers, recommended vegetable dietary in cases of scurvy and defined Devonshire colic, which his medical neighbour, Sir George Baker, traced to lead in the vats and cider presses. Willan made a systematic study of the health conditions of London. Withering, or Shropshire, contributed to our knowledge of the incidence of scarlet fever, analysed water, was a climatologist and used digitalis. Edward Jenner, a practitioner in Gloucestershire, introduced vaccination. James Lind issued the first treatise on scurvy and the health of seamen. Thackrah, who practised in Leeds, explored industrial health problems and described dust diseases and brass-founders' ague, and Michael Taylor of Penrith was the first to elucidate milk-borne epidemics. Indeed, the 18th and 19th centuries furnish a remarkable record of clinical discoveries which prepared the ground for the study of causation and the influence of external environment in relation to communal disease.

*Legislative Action.*—The applications of state medicine, in the 19th century, found their inspiration in England in two sources, and their expression in legislation. The twofold inspiration came from the recurrent outbreaks of cholera and consequential commissions of inquiry, and from popular demand for reform, which was realised after each of the four extensions of the franchise (1832-1918). The Legislature placed on the statute book a wonderful series of enactments. The alarm caused by the ravages of cholera in 1831 led to the first steps in administrative sanitary reform; in 1849 there was a second visitation of cholera, and in 1854 a third. These cholera epidemics led to a new appreciation of the unsanitary condition of the country as a whole, to an understanding of the nature of the disease and its epidemicity, to the establishment of "cholera dispensary stations" and to the Infectious Diseases Prevention Act 1855.

Concurrently with and following upon these epidemics there were various commissions of investigation. In 1838-9 the Poor Law Commissioners drew attention to the prevalence of epidemic disease and its relation to poverty. The reports by Neil Arnott, Kay, Southwood Smith and Chadwick were the predecessors of another famous series of investigations in 1850-65 by Greenhow and his colleagues under the Privy Council into epidemic diarrhoea, pulmonary disease, infant mortality and ague; and also into the four "elementary requisites of popular healthiness," viz., adequate food supply, sufficient house accommodation, healthy physical surroundings and wholesome industrial circumstances. They led the way to the new application of medicine for the removal of nuisances, the prevention of contagion and infection and industrial hygiene and welfare.

In 1843 Sir Robert Peel, at the instigation of Edwin Chadwick, advised appointing a Royal Commission to inquire into the outbreaks of disease in large towns and the best means of improving the public health, the report of which led to the passing of the comprehensive sanitary measure in 1848, the establishment of the General Board of Health and the appointment of medical officers of health. In 1869 was appointed the Royal Sanitary Commission, on which sat Thomas Watson, James Paget, Henry Acland, Robert Christison and William Stokes, and before which Simon, Budd, and Farr gave evidence. Speaking broadly, the 1843 commission found the existence of a serious national evil of insanitation and ill-health, and recommended a legislative remedy, whereas the 1869 commission found that the remedy had proved ineffective and recommended that "the present fragmentary and confused sanitary legislation should be consolidated." They proposed, in fact, for the first time, a Ministry of Health, and though the case miscarried, and the Local Government Board was created in 1871, a comprehensive Ministry of Health was at last established in 1919. The commission's summary of the national sanitary minimum of "What is necessary for civilised social life" provided the grand inventory of that period (1871) and was as follows:—

1. The supply of wholesome and sufficient water for drinking and washing.
2. The prevention of the pollution of water.
3. The provision of sewerage and utilisation of sewage.
4. The regulation of streets, highways and new buildings.
5. The healthiness of dwellings.
6. The removal of nuisances and refuse, and consumption of smoke.
7. The inspection of food.
8. The suppression of causes of diseases, and regulations in cases of epidemics.
9. The provision for the burial of the dead without injury to the living.
10. The regulation of markets, etc., public lighting of towns.

*Registration of Death and Sickness.*—The programme of 1871 represented the most enlightened thought of the time regarding the sphere and scope of preventive medicine. Even now it is almost a complete summary of the elements of a sanitary environment. The commission also showed how it could be worked out in practice by laying down the general principles to be followed and by drafting a new statute. They diagnosed with unflinching accuracy the causes of imperfect sanitary administration—(a) the variety and confusion of authorities concerned in the public health, (b) the want of sufficient motive power in the central authority, (c) the non-coincidence of areas of various kinds in local sanitary government, (d) the number and complexity of enactments, (e) the needless separation of subjects, (f) the leaving some general Acts to voluntary adoption and the permissive character of other Acts and (g) the incompleteness of the law. Finally, the commissioners lent all the power and prestige of their position and experience in unreserved support of the great principle of local self-government.

*Public Health Act, 1875.*—The Public Health Act of 1875, which emerged from the labours of the Royal Sanitary Commission, may be regarded as marking a great advance in the development of sanitary administration. Before that time sanitation was interpreted in large measure as a negative policy

—in a word, the removal of nuisances; after that time sanitation received a new connotation, positive, constructive, remedial. That is the reason why this Act forms the great line of division, the watershed in the progress of modern preventive medicine, on its environmental side. The report of Sir Robert Peel's Commission, in 1845, contains a significant suggestion in its recommendation that each local governing body should have a medical officer whose duty it should be "to ascertain the true causes of disease and death, more especially of epidemics increasing the rates of mortality, and the circumstances which originate and maintain such diseases, and injuriously affect the public health." No one can read the preamble of the report of the commission of 1869 on the history of the sanitary laws enacted up to that date without being impressed with their character. They dealt, almost monotonously, with nuisances and their removal, sewerage and drains, sewage utilisation, the paving, lighting and cleansing of streets, common lodging-houses, the supervision of artisans' dwellings, smoke nuisances, local government and the burial of the dead. The only group of laws directly concerned with disease was the Vaccination Acts. Then came the Public Health Act of 1875, which in conception and working led for 20 years to enactments on the prevention of river pollution, the protection of water supplies, the provision of housing accommodation and isolation hospitals, and the notification and prevention of infectious disease. The elementary Education Act of 1870, and the Public Health Act of 1875, were forms of germinative legislation bearing fruit in a single generation.

*The Practitioner's Aid.*—Whilst the state was thus calling in to being various public medical services, the practitioner in medicine and surgery was finding ways and means of preventing disease met with in his practice, both infectious and non-infectious. Abortion, miscarriage, still-birth are preventable conditions. Children's disorders such as ophthalmia, rickets, dental decay and malnutrition are preventable, and the same may be said of many diseases of the skin, the eye, ear, nose and throat. The examination of recruits and of insurance patients shows that much physical impairment is due to the effects of rheumatism, dyspepsia, constipation, bronchitis, anaemia, debility, neurasthenia, heart disease, dental decay, mental disease or disorders of metabolism. Some of these conditions are due to factors such as infection (fevers, rheumatism, tuberculosis, venereal disease, etc.), or degenerative processes, like arteriosclerosis and nephritis, or fatigue and unhygienic living; others are more obscure, but the great bulk of them are in large degree preventable. Midwifery alone provides many opportunities for preventive medicine.

*Surgical Aid.*—Surgical conditions seem at first sight to be less directly preventable, and curative only. Yet the task of the surgeon is to serve and assist nature by placing the human body and its organs at her service, by removing obstructions from her path, by supplementing and aiding her processes and by fortifying the body defences against infection or accident. All this is of the essence of preventive medicine. It is an alliance with nature against disruptive forces. Surgery finds its preventive expression in a great variety of ways. The fundamental principles of aseptic surgery are the elimination of sepsis and its practice is repair, the removal of hurtful tissues and the avoidance of disablement. Preventive surgery may be illustrated in a general way as follows:—

- (a) Surgery in children's conditions—enlarged tonsils and adenoids, phimosis, hernia, ophthalmia.
- (b) Surgery in deformities—rickets, tuberculosis, scoliosis, talipes, flat-foot, hammer-toe, fractures.
- (c) General surgery—sepsis, tuberculosis, varicose veins, hernia, venereal disease, malignant disease, tumours, thoracic conditions, abdominal and genito-urinary surgery, gynaecology, dental caries.
- (d) Industrial surgery—wounds, fractures, injuries, poisons, fumes, anthrax, tetanus, etc.

The first generation of the 20th century (1900-24) witnessed a continued development in sanitary environment, which indeed must always remain the foundation of preventive medicine, and

<sup>1</sup> Report of the Royal Sanitary Commission 1871, vol. I, p. 20.

in various new departures dependent upon the principles which had been established by the Public Health Act 1875, and by the growth of medical knowledge. The public health service expanded to include particular measures against tuberculosis and venereal disease, the provision of municipal midwives, and a remarkable extension of the supervision of maternity and child welfare. Indeed, the characteristic of this period was the progress made in personal hygiene as distinct from environmental hygiene. Its centre is the person rather than the premises. The School Medical Service was organised in 1907, systematic provision was made for the care of infancy in 1914, the National Health Insurance Act was passed in 1911 and medical research has been organised on a large scale.

Concurrently with these great movements increased attention was given to industrial welfare and the health of the factory worker. Time alone can show the effect on the public health of the wide extensions and applications of the public health principles of 1875. It cannot be doubted that an improved midwifery service, the care of the newborn infant, the systematic health supervision of every school child, improved hygiene in the workshop and factory and a system of health insurance by which medical aid is promptly available for 14,000,000 insured persons must exert in the course of time a profound effect upon the national health. That such an effect has already been produced is shown by the vital statistics. The following table gives the birth-rate, population, number of deaths, average annual death-rate and even mortality from 1871 to 1920—

| Period    | Average annual birth-rate per 1,000 living | Average estimated population | Average estimated number of deaths registered | Average annual death-rate per 1,000 | Average annual infant mortality, i.e., deaths of children under one year of age per 1,000 births |
|-----------|--------------------------------------------|------------------------------|-----------------------------------------------|-------------------------------------|--------------------------------------------------------------------------------------------------|
| 1871-1880 | 35.4                                       | 24,225,271                   | 517,831                                       | 21.4                                | 149                                                                                              |
| 1881-1890 | 32.4                                       | 27,384,934                   | 524,477                                       | 19.1                                | 142                                                                                              |
| 1891-1900 | 29.9                                       | 30,643,316                   | 557,538                                       | 18.2                                | 153                                                                                              |

| 1911-1920 | 21.8                                       | 35,750,765 <sup>1</sup>      | 518,805                                       | 14.3 <sup>2</sup>                   | 100                                                                                              |

<sup>1</sup> Including civilian population only from 1915-8.

<sup>2</sup> Including civilian mortality only from 1915-8.

In 1924 the birth-rate had fallen to 18.8, the death-rate to 12.2 and the infant mortality rate to 75 per 1,000 born. The decline in the infant mortality rate from 153 per 1,000 born in 1891-1900 to less than 80 for 1920-4 is one of the most significant and sensitive indications of the improvement of the public health. Perhaps an even more valuable indication is the expectation of life at birth. In 1871-80 the expectation of life at birth in London was for males 38 years, and for females 42. By 1920-2 these figures had risen to approximately 54 years for males and to 59 for females, a rise of 16 and 17 years respectively in two generations.

Since 1900 there have been various collateral developments in medicine which cannot fail to exert powerful influence on the prevention of disease. The use of X-ray (*q.v.*), of radium (*q.v.*) and of the ultra-violet rays has been conducive not only to greater accuracy of diagnosis, but also to steady improvement in the treatment of tuberculosis (*q.v.*) and cancer (*q.v.*). Heliotherapy (*q.v.*) and open-air treatment are likewise finding many applications. The perfection of the Wassermann-Bordet test and the discovery by Ehrlich of salvarsan (the 606th preparation tried for syphilis) have advanced the diagnosis and treatment of this disease, now carried out in England and Wales in 190 special clinics receiving state subsidy. (see **VENEREAL DISEASES**). The Widal reaction for typhoid and various tests for tuberculosis have been followed by the Schick and Dick immun-

ising tests for diphtheria and scarlet fever, and these have opened up new opportunities for the control of these diseases (see **INFECTIOUS FEVERS**).

The dispensary and sanatorium treatment for tuberculosis has been greatly developed, and this has led to the arrest or retardation of the disease in many individuals. The disease has been steadily declining in Great Britain since about 1875. The new knowledge of filter-passing microbes (*q.v.*) has created far-reaching possibilities, and that of the physiology of internal secretion has led to the introduction for therapeutic purposes of artificially prepared extracts, such as insulin (for diabetes), thyroxin (for myxoedema) and pituitrin (for acromegaly). (See **ENDOCRINOLOGY**.) There has also been an enormous development in the use of antitoxins, vaccines and serums (see **IMMUNITY**; **SERUM THERAPY**; **VACCINE THERAPY**)—the harvest of the epoch-making work of Louis Pasteur.

Lastly, the creation of the League of Nations has facilitated considerable development in the international study of hygiene, and there has thus been opened a new sphere for the application of preventive medicine to international health problems and the control of the tropics for the white man. Plague, yellow fever, malaria and sleeping sickness have now, under favourable circumstances, come under man's dominion.

See J. G. Fitzgerald, P. Gillespie and H. M. Lancaster: *An Introduction to the Practice of Preventive Medicine* (1923). (G. N.)

**United States.**—The rapid growth of America was associated with primitive sanitary conditions, so that epidemics of typhoid fever, cholera, yellow fever, typhus fever and other preventable plagues marred the development of the country. In many instances the water supplies were contaminated and sewage and wastes were disposed of by ready methods that were unsanitary and unsatisfactory. The reforms along these lines in recent years have worked hygienic marvels. The United States grew at a time when sanitation and hygiene were emerging from the Dark Ages. Notable contributions to the science and practice of preventive medicine and hygiene have been made by American workers in the laboratory and in the field.

In 1893 Theobald Smith demonstrated that Texas fever of cattle was transmitted by the bite of an infected tick, thus proving for the first time the great principle of insect-borne transmission of infection. Shortly afterwards the mosquito was shown to be the vector in the spread of malaria and then of yellow fever. Following this, other insects were found to be responsible for a long and growing list of infections. In 1900 Carter discovered the extrinsic period of incubation of yellow fever. In 1882 Carlos Finlay of Cuba implicated the responsible mosquito, but it remained for the United States Army Medical Commission, consisting of Reed, Carroll, Lazear and Agramonte, to prove the fact by a convincing demonstration in 1900. This discovery was soon put to practical use by White in New Orleans during 1905 when, for the first time, an epidemic of yellow fever was stamped out before the advent of frost. The work of Gorgas which made the building of the Panama Canal possible was a dramatic demonstration in preventive medicine.

The cause and modes of spread of tularaemia, another insect-borne disease, primarily of rabbits and secondarily of man, were discovered by McCoy and Francis, scientists of the Hygienic Laboratory of the U. S. Public Health Service. Ricketts lost his life from typhus fever in Mexico City while unravelling the mysteries of that disease, and McClintock was a martyr to Rocky Mountain spotted fever while studying that tick-borne infection which has been revealed by American investigators. A triumph was achieved by the Dicks of Chicago who demonstrated the cause of scarlet fever and developed an antitoxic serum for its cure, a toxin for its prevention and a skin test (the Dick test) by which it is possible to determine who are susceptible and who immune. Stiles pointed out the importance of hookworm disease and discovered an American species of this parasite. Trudeau founded at Saranac Lake, New York, the sanitarium for tuberculosis which now bears his name; Theobald Smith discovered the bovine tubercle bacillus; and Noguchi's brilliant achievements

have placed some obscure problems on a secure scientific basis. In the field of nutrition, Atwater and Benedict, Osborne and Mendel, and Lusk and McCollum have enriched the important subject of dietetics, which is one of the most fundamental factors in health. Among other outstanding contributions should be mentioned the work of Goldberger on pellagra and Strong on trench fever. Oliver Wendell Holmes, as early as 1843, pointed out the contagiousness of puerperal fever.

The blessings of anaesthesia were among America's first contributions to preventive medicine. Long, a country physician in Georgia, operated on several cases under ether in 1842-3. Wells of Hartford, Connecticut, in 1844 began the use of nitrous oxide in dentistry. The first public demonstration of a surgical operation under the deep sleep of ether was inspired by Morton and was performed Oct. 16 1846 at the Massachusetts General Hospital, Boston.

The United States was a pioneer in recognising the importance of clean, safe milk supplies. In Jan. 1908 the United States Public Health Service published a Bulletin of the Hygienic Laboratory entitled "Milk and Its Relation to the Public Health," which favourably influenced the milk supplies in the United States and elsewhere. Pasteurisation was advocated and is now generally applied to all large milk supplies throughout the land. While the United States was somewhat tardy in supplying clean and safe water to its large cities, it developed the method of rapid (or mechanical) sand filtration for muddy waters and has been quick to seize the advantage of chlorination. The recent reduction of typhoid fever in the United States is one of the dramatic demonstrations of preventive medicine.

The United States was early in the field to develop special schools for public health education. A School of Public Health was established by Harvard University and The Massachusetts Institute of Technology in Boston in 1913 (Rosenau, Sedgwick and Whipple). Other universities have participated in this movement, especially the University of Pennsylvania (Abbott), Johns Hopkins University (Welch) and the University of Michigan (Vaughan). American names especially associated with public health administration are Biggs, Chapin, Shattuck, Wiley and Wyman.

Health administration in the United States is part of the police power of the several states. The Federal Government has no constitutional power for local administration of health codes. It has, however, full powers with reference to maritime quarantine and interstate quarantine; it acts in emergencies and it promotes public health through demonstrations, co-operation and investigation. Federal health activities are centred in the United States Public Health Service, which is a bureau of the Treasury Department. Each state has a health organisation, and all the large cities and some of the smaller ones also have well organised health services. The county district is the weakest link in the sanitary chain, but in 1925, 280 of the 2,850 rural counties of the United States had full-time health officers. Many other agencies are active in preventive medicine throughout the country—for example, the International Health Board of the Rockefeller Foundation; the Rockefeller Institute for Medical Research; the McCormick Institute for Infectious Diseases; the Society for the Study and Prevention of Tuberculosis; the National Health Council; the Metropolitan Life Insurance Company, as well as universities, health centres, etc., all of which are active in promoting a better civilisation through obtaining and maintaining a higher standard of health. (M. J. R.)

**PRICES** (see 22.315).—The following article deals with the general movement of wholesale prices, (a) since 1903 in the United Kingdom and (b) since 1913 in certain other countries; (c) the wholesale prices of selected commodities; and (d) the general movement of retail prices of food in the United Kingdom. These general movements are measured by index numbers (see INDEX NUMBERS), which are averages, computed in various ways, of the changes of prices of selected commodities. The relative importance given to the various classes of commodities in the principle index numbers for the United Kingdom are indicated in the following table:—

|                                  | 1,000                                                     | 1,000           | 1,000                                        | 1,000                       |

<sup>1</sup> In the old series, discarded in 1920, the food group accounted for 652 and the materials for 348 in 1900.

<sup>2</sup> These are the effective weights reached by Sauerbeck's numbers when comparison is made with 1913.

During the very rapid and diverse price movements from 1914 to 1922 the results obtained by the three methods diverged (see Table II.): that of the Board of Trade is on the broadest and most scientific basis.

(a) *The United Kingdom*.—Table I. exhibits the general movement in the 12 years before the World War. The year 1903 is taken as the starting point, since, after the considerable fall in prices ending in 1896 and the subsequent temporary inflation of 1900-1, it may be regarded as a normal year. Wholesale prices rose steadily from 1902 to 1913, except for the short period of depression in 1908-9, but tended downwards in the first half of 1914.

TABLE I. *Index Numbers of Movement of Wholesale Prices in the United Kingdom. Level in 1913 Taken as 100*

| Year                | Board of<br>Trade<br>Old Series | Sauerbeck | Economist |
|---------------------|---------------------------------|-----------|-----------|
| 1903                | 83                              | 82        | 79        |
| 1904                | 84                              | 83        | 81        |
| 1905                | 84                              | 85        | 81        |
| 1906                | 87                              | 91        | 88        |
| 1907                | 91                              | 94        | 93        |
| 1908                | 89                              | 86        | 83        |
| 1909                | 90                              | 87        | 84        |
| 1910                | 94                              | 92        | 90        |
| 1911                | 94                              | 94        | 95        |
| 1912                | 99                              | 100       | 108       |
| 1913                | 100                             | 100       | 100       |
| 1914 (Jan. to June) |                                 | 97        | 96        |

Immediately after the declaration of war in 1914 prices began to rise, and with certain interruptions continued to mount up till the spring of 1920, when the index numbers reached their maximum (*Statist* 323, end of April; *Economist* 326, end of March; Board of Trade 357, average of July). Till Oct. 1917 the increases showed a remarkable regularity, averaging 2% monthly, equivalent cumulatively to 27% per annum; on this scale the index in the successive Octobers would reach 106 in 1914, 135 in 1915, 171 in 1916, 217 in 1917 and 258 in 1918, numbers which (except the last) are in close agreement with those shown in Table II. There was, however, a definite seasonal movement super-imposed on this regularity; in the first three or four months of each year prices moved up with special rapidity, while in the summer the increase was slackened and in some cases was replaced by a fall. The check in the increase in the summer of 1917, following a specially rapid rise, is attributable to the control of prices which by that date was general. From Aug. 1917 prices continued to rise in spite of control till Sept. 1918, but the rise in these 13 months aggregated to only 13% (239 against 213).

After the Armistice prices fell slowly for five months, during the season in which in previous years the increase had been specially rapid, but expectations of a permanent fall were not realised; in the year beginning April 1919 the index rose from

224 to 323, or 44%. The reaction began in the early summer of 1920, and the fall was very rapid in the following winter and continued till the end of 1921, when prices were 60% above the pre-War level, and only half those at the maximum of April 1920 by *The Statist* account. During the subsequent four years the movement was relatively slight, but there was a definite fall and rise in the middle of 1923, and a further rise in the latter part of 1924. The gold basis was restored in May 1925, and both in anticipation of this and after it there was a fall amounting to 10% in the whole year, till prices were 58% above 1913; equilibrium with the United States price index was reached in the latter part of the year.

TABLE II. Monthly Index Numbers (*Statist*)

| Average of Jan.-July 1914 = 100 |      |      |      |      |      |      |      |      |      |      |      |      |  |
|---------------------------------|------|------|------|------|------|------|------|------|------|------|------|------|--|
| End of                          | 1914 | 1915 | 1916 | 1917 | 1918 | 1919 | 1920 | 1921 | 1922 | 1923 | 1924 | 1925 |  |
| Jan. . . . .                    |      | 117  | 150  | 193  | 225  | 233  | 298  | 239  | 160  | 158  | 166  | 175  |  |
| Feb. . . . .                    |      | 122  | 154  | 199  | 227  | 227  | 317  | 220  | 160  | 160  | 168  | 173  |  |
| March . . . .                   |      | 126  | 158  | 205  | 228  | 224  | 316  | 215  | 161  | 161  | 166  | 169  |  |

(b) *Other Countries.*—The world movement of prices is best indicated by the United States index number, since in that country alone the gold basis has been maintained throughout the period 1913 to 1925. In the United States prices rose rapidly from the year 1916 to a maximum in 1920—in April the index was 273—and then fell rapidly till the spring of 1921; after slight variations, there was a rise from June 1924 to Feb. 1925, and during the subsequent 12 months the number remained close to 160. In all the countries included in Table III. there was a rise from 1915 to 1920, greater or smaller according to the amount of paper money issued. In Germany and Austria the increase was so great that the numbers reached were almost incredible. After 1920 there was a fall in all the index numbers

in the table; by the end of 1925 Canada, Australia, South Africa, Sweden, the Netherlands, Switzerland and Germany had returned to the gold basis, and in Canada and Europe there was a close approximation to the American index. In Belgium, France and Italy depreciation recommenced in 1922, and in France and Italy prices had in 1925 passed the 1920 average. At the end of 1925 Japan was taking steps to stabilise prices in that country.

FIG. 1.—Diagram showing changes in wholesale prices in certain countries above or below the price level in 1913, which is taken in every case as equal to 100. The diagram is based on the figures given in Table III. below.

(c) *Selected Commodities.*—When commodities are taken separately, the measurements can be made more exactly, subject to the two following qualifications: (1) during the War period the ordinary sources of supply were so disturbed that pre-War kinds and qualities were no longer in the market (in *The Economist* index number 25 out of the 44 quotations included were subject to some modification of quality); and (2) a statement of prices is generally taken as meaning the price at which a purchaser can obtain the goods he desires, and at which a merchant is willing to sell, but in the time of control and rationing these conditions did not obtain, and the price was fixed by other conditions than those which influence a free market.

TABLE III. Index Numbers of Wholesale Prices

Table IV. is based on the prices tabulated annually, in *The Journal of the Royal Statistical Society*, by the editor of *The Statist*. The index numbers have been recast, the average price in 1913 being taken as 100 for each commodity; the totals have been obtained by grouping together the separate entries on the same plan as in the original, but the change in the base year affects the results, which thus differ from those given in Table II. in the same way as if the weights had been changed.

TABLE IV. *Statist Index Numbers. Average for Each Year. Average for 1913 Taken as 100 in Each Case*

<sup>5</sup> La Plata for 1924.

It is at once evident that the various prices have not followed the same course; the extremes in 1920 were house coal, whose price rose only 49% in seven years, and Java sugar, where the price is 587%. This wide divergence of itself shows that the general index number cannot have great precision. The prices as recorded are the resultants of at least five forces, viz.: the general inflation of prices, the conditions of supply and demand for the separate commodities, the control of supply, the control of prices, the change of quality. In 1915-6 the principal increases may be traced to the diminution or difficulty of supply (cereals, sugar, flax), to acuteness of demand (wool) or to both (timber). In 1917-8 the prices of nearly all commodities whose supply was threatened or for which the demand was increased were controlled. The quality was changed directly in the case of flour, and indirectly when the prices were averages of several grades, as in the cases of meat, flax, leather and timber.

*Food.*—The price of wheat rose immediately after the beginning of the War, and with it the prices of flour, oats, maize and

rice. In Great Britain the prices were checked by the establishment of a Government system of purchase at the end of 1916 and by the control of the prices of home-grown cereals in 1917; with this system, flour of mixed materials was substituted for wheat-flour and the product sold at a price kept constant and relatively low by the help of a subsidy, beginning in the autumn of 1917. In the case of wheat and flour the subsidy and control continued till the beginning of 1921, but the prices rose; the

prices of other cereals increased very rapidly from the autumn of 1919. An attempt was made to control the consumption of oats in 1917-8, otherwise cereals were not rationed. The wholesale price of potatoes was fixed from time to time, the Government undertaking to make good growers' losses, but the price was changed so frequently that the control had little effect. After the general fall of prices in 1920-1, the fluctuations were principally due to rather abnormal harvest vicissitudes.

During the War the price of meat increased somewhat less than that of commodities in general. Prices were fixed in Great Britain in Aug. 1917 and consumption was rationed early in 1918; after the Armistice control was gradually released, but prices of beef and mutton changed very little during the two years after the first fixing of them. After the great drop in prices in 1921-2, wholesale prices of beef and pork remained relatively low, and those of mutton high during the period 1922-5. Sugar was controlled till the beginning of 1921, at which date the world's supply had been adjusted to the new conditions, but the supply of beet sugar did not recover, and prices were relatively high till 1925.

*Materials.*—The prices of coal, iron and steel were subject to great fluctuations. Iron and steel were controlled during the War, and from Nov. 1917 till early in 1919 a subsidy was given to producers. On its removal prices rose very considerably in consequence of the great demand for construction and repairs. Subsequently there was the general collapse in prices, marked by the coal strike of 1921, partly due to the gradual return to normal conditions of the continental coal mines and steel works. Some stimulus was given to prices by the French occupation of the Ruhr district in 1923, but by the end of 1924 it was evident that the world's capacity for coal and steel production was in excess of requirements, and prices fell to an unremunerative level. The prices of copper and tin and, in some years, of lead fell relatively to general prices.

The prices of cotton and wool reached great heights in the boom of 1920, followed by a complete collapse in 1921. During the period 1922-5 a world shortage of supply (as compared with normal requirements) kept prices on a high level, while continued fluctuations of price hampered manufacture. The extraordinary rise in the price of flax was due to the cutting off of the Polish-Russian supply, which had not recovered by the end of 1925. Space does not permit any analysis of the price movements of miscellaneous materials, or of that of rubber, not included in the Statist list.

*Retail Price Movements in the United Kingdom.*—Table V. shows the movement of the Ministry of Labour's index of retail food prices. This measures the relative cost of purchasing each month exactly the same quantities and as nearly as possible the same kind of food as in a standard budget of working-class expenditure; this budget is based on an investigation made in 1904 and was modified slightly in 1914. During the period of control, 1917-9, the index is to some extent fictitious, since the quan-

| Whole-sale Food (Statist) | 142  | 173  | 225  | 231  | 245  | 308  | 210  | 173  | 163  | 174  | 169  |

ties of the goods included could not be purchased, and generally no allowance is made for modifications of purchases when prices are changing unequally; but there is good reason to believe that these considerations are of little importance after 1920. There is a seasonal fall in the spring and rise in the autumn, owing to the inclusion of dairy produce, and in particular to the supposition that the same number of eggs are bought in Jan. and April; but not improbably this reflects a real change in the cost of nourishment. Though the number is based on an average of prices all over the country, it is nearly applicable to all districts, since in recent years there has been increasing uniformity in prices and their changes.

The Statist wholesale food index is repeated (on the basis of July 1914) for comparison, though the range of commodities and their relative importance are not the same in the two numbers. The rise up to 1920 is considerably smaller in the retail index, while the concurrence since 1921 is very striking. Retail prices in 1921 did not fall, however, so rapidly as wholesale, and it is generally to be expected that their movements will be later and of a smaller amplitude than those of wholesale prices.

(A. L. Bo.)

**PRIMO DE RIVERA, MIGUEL** (1870- ), Spanish soldier and statesman, known as the Marquis de Estella, was born at Jerez de la Frontera Jan. 8 1870, and subsequently entered the Madrid military academy. After four years in Toledo he was ordered to Morocco in 1893 as lieutenant of the Infantry Regiment of Extremadura, and in Oct. of the same year was promoted to the grade of captain for extraordinary personal bravery. In 1895 he was adjutant to Gen. Martínez Campos in Cuba, and rose to be major commanding the infantry battalion of Zamora.

He served in the Philippines in 1897, and negotiated the Treaty of Biagnabato (Biacabato) on Dec. 12 1897, whereby the insurgents and their leader Aguinaldo surrendered and retired to Hongkong (*see* 21.339). Returning from the Philippines, in 1900 he commanded a battalion in Barcelona for a year and a half, after which he was transferred to the general staff, whence he repaired to Algeciras as commander of a battalion. In 1915 he was appointed Governor of Cadiz, and spent a month at the French front during the World War. His speech to the Hispano-American Academy advocating the exchange of Gibraltar for Ceuta or other North African territory, and corrosively criticising the Government's policy in Morocco, resulted in his being relieved from the governorship of Cadiz. His exceptional military talents, his brilliant exploits, his unaffected simplicity and straightforwardness, his sympathy with the feelings and interests of the army and the nation, had won for him the confidence of the King, the general staff and the public, so that despite his outspokenness in the academy, he was soon afterwards promoted to be general and chief of the First Infantry Division in Madrid.

In 1921 the Marquis de Estella was elected Senator for Cadiz, and delivered a powerful speech in the Upper Chamber reaffirming in emphatic terms the views he had already put forward respecting Morocco and the necessity of relieving the nation of that onerous burden. Whereupon Primo once again lost his post. But the effects of his uncommon civic courage and unselfish patriotism prevailed once more over considerations of petty discipline, and he was entreated to undertake the most difficult and dangerous post in Spain—that of Captain-General of Catalonia—with a view to ending the reign of terror there, of which the central Govt. was content to remain a listless onlooker. Separatism, syndicalism and genuine thuggism of the most dastardly character paralysed the population. Accepting the invidious task, the new captain-general soon reaped a measure of success fully proportionate to his chivalrous character. His personal influence and his limited legal powers.

Easy and generous to the point of familiarity in his private life, the Marquis de Estella was punctilious and exacting in matters affecting the nation, the army and the monarch, and his integrity was proverbial. He soon recognised the chaos in Catalonia for what it was—one of the indirect consequences of the breakdown of the parliamentary régime. This was also responsible for the mismanagement of the Morocco campaign, as

well as for the ferment in the army brought about by the niggardliness, the favouritism and criminal recklessness of the central Government. The Cortes, which in a decade had trebled the pay of its members, refused the money needed for the training and equipment of the rank and file of the army, while the average officer was so badly paid that he could not afford a sanitary dwelling, decent clothing or even a pair of leather boots. Although the evil had long been diagnosed nobody had had the courage to uproot it, until the dauntless Marquis de Estella surprised the world by his manifesto dated Sept. 12 1923, and published the following day, suspending the constitution and proclaiming in its place a directorate consisting of military and naval officers. He further announced that this arrangement was but a bridge leading to a future system of government better suited to Spain's needs than that which he abolished. This military coup d'état was carried out without bloodshed.

The methods of the directorate were prompt and radical. Separatism, Syndicalism and Bolshevism were put down swiftly and without needless rigour. An anti monarchist conspiracy was checked with dignity and disdain. Labour conditions were bet-

ter (pop. 12,347 in 1921), is situated on the shore of Hillsborough Bay, which forms a fine harbour. Other towns are Summerside (3,228) and Souris (1,094). About 77% of the population is rural.

The government is vested in a lieutenant-governor, an executive council of nine members, six of whom are without portfolios, and a legislative assembly of 30 members; 15 councillors elected on a property qualification and 15 assembly men on popular franchise; the suffrage was granted to women in 1922. The province has four members in each of the Federal Houses of Parliament; the representation in the House of Commons, under an Imperial statute of 1915, cannot fall below the representation in the Senate.

In education progressive changes have been made, including the introduction of a minimum wage for teachers, a substantial increase in the education grant, and the establishment of an agricultural technical school in 1921.

*Production.*—Agriculture was still the leading industry in 1925, despite the annual decline in production from 1919 onwards. The yield in thousands of bushels and value in thousands of dollars of the principal field crops from 1922–5 was as follows:—

| Crop                                          | 1922  |       | 1923  |       | 1924  |       | 1925  |       |
|-----------------------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|
|                                               | Yield | Value | Yield | Value | Yield | Value | Yield | Value |
| Spring Wheat . . . . .                        | 689   | 863   | 575   | 655   | 535   | 850   | 554   | 798   |
| Oats . . . . .                                | 6,533 | 2,662 | 5,881 | 2,565 | 5,065 | 3,004 | 5,519 | 2,468 |
| Mixed grains . . . . .                        | 652   | 408   | 738   | 421   | 766   | 574   | 749   | 438   |
| Potatoes <sup>1</sup> . . . . .               | 2,658 | 1,329 | 2,732 | 1,776 | 5,776 | 2,558 | 3,859 | 6,753 |
| Turnips, mangolds <sup>1</sup> , etc. . . . . | 2,313 | 833   | 2,157 | 647   | 2,336 | 701   | 2,531 | 1,012 |
| Hay and clover <sup>2</sup> . . . . .         | 379   | 4,553 | 321   | 3,856 | 372   | 4,090 | 366   | 3,755 |

<sup>1</sup> Cwts. <sup>2</sup> Tons.

tered, taxation reforms were drafted, a supplementary grant of 12,000,000 pesetas was made for education; the administration of justice, which needed thorough reform, was partially purged; gambling, which had become a cancerous growth on the body politic, was to a large extent suppressed throughout the realm, and promotion in the public services was made dependent upon merit. The parlous condition of the finances also exercised the ingenuity and tested the resourcefulness of the directorate, which within 15 months cut down a growing deficit of 1,000 million pesetas to 532 millions.

The dictator and his colleagues revived the mediaeval liberties of the municipalities, giving them strong incentives to self-government, and formed a national militia the function of which was to maintain public order in times of unrest, and otherwise to sustain the spirit of civic virtue. Lastly, Primo called into being under the name *la Unión Patriótica*, a fellowship of "citizens of goodwill" to work for the realisation of ethical ideals in public life, and hinder a return to the venal system just swept away. This innovation was welcomed with marked enthusiasm, and within a few months the members numbered over 1,250,000. Mindful of the undertaking he had given at the outset, Primo dissolved the directorate on Dec. 3 1925, and substituted a government composed of civil as well as military ministers—mostly young men—as a preparatory step towards a new régime. The dictator himself, however, became Premier, and his policy was pursued without change.

Upon his accession to power Gen. Primo de Rivera's views on the Morocco problem underwent a complete transformation, which he frankly proclaimed without apologies but not without explanation. History, he held, constantly modifies political situations, and methods must be adjusted to current events. Of this the Morocco imbroglio was an illustration. By the year 1923 it had ceased to be a purely Moroccan struggle on the part of Abdel Krim for home rule, and had become an international enterprise (*see* MOROCCO). (E. J. D.)

**PRINCE EDWARD ISLAND** (*see* 22,344), a province of the Dominion of Canada. The population in 1921 was 88,615, a reduction of 5.46% from the census of 1911. This tendency to decline has continued in each decennial period since 1891 when the population reached its highest figure of 109,078. This island province, however, is still the most densely populated in the Dominion, having 40.5 persons to the square mile. Charlottetown, the capi-

Seed-potato production, for export to the United States, showed a steady development during the years 1921 to 1924. Dairying and poultry-raising are important: the production of creamery butter increased from 670,908 lb. in 1910 to 1,537,437 lb. in 1923; during the same period the production of factory cheese fell from 3,293,755 lb. to 1,811,537 pounds. The breeding of silver black foxes is an established and profitable industry. After a long period of depression it began in 1922 to gain ground, and in 1924 was the second largest industry of the province, with 448 fox farms and an estimated revenue from the sale of pelts and animals of about \$2,000,000.

The fisheries of the province were valued at \$1,201,772 in 1924, a reduction of over 30% as compared with the preceding year. The lobster catch formed more than half of the total, oysters ranking second in importance. Attempts to replant the oyster fields have largely proved a failure owing to the presence of destructive pests. Manufacturing is limited chiefly to food products, the gross value in 1924 being \$4,462,821.

In 1924 the province had 279 m. of railway, and daily communication by car ferry with the mainland has been maintained, with rare interruptions, summer and winter, since 1918. Both are operated by the Canadian National Railways. The construction of a tunnel to replace the ferry, and the standardisation of gauges on the island railways have frequently been advocated. (S. L.)

**PRINCE OF WALES:** *see* EDWARD, PRINCE OF WALES.

**PRINCETON UNIVERSITY.**—In Sept. 1910 Woodrow Wilson resigned the presidency, and in Jan. 1912 Prof. John Grier Hibben was elected president. The period between 1912 and 1925 was marked by gradual restoration of solidarity after the disrupting controversies of the preceding four years; by extended administrative reorganisation; by promotion of faculty autonomy, remuneration and welfare; by clarification of educational aims; by closer attention to the physical, intellectual and moral environment of undergraduate life; by wider recognition of alumni representation.

In 1912 and 1919 the business organisation of the university was remodelled. A standing committee of trustees and of the faculty was instituted in 1912 to consider all matters of educational policy and administration; in 1913 the faculty was given voice in forming its committees and initiating appointments and promotions; in 1918 the rights of the individual in

cases of dismissal were safeguarded; a new scale of salaries was adopted in 1920; retiring allowances and insurance were set in 1922; and relief for housing shortage was supplied in 1922 and 1925. Especial attention was given to the development of the students' health, by thorough physical examination, and by required supervised exercises. A development of the honour system in examinations (adopted 1893), to cover petty dishonesties, was authorised in 1921 and student self-government was so extended that by 1925 the conduct of discipline, student activities and the regulation of athletics were shared by joint committees of faculty and undergraduates. In the World War over 5,600 Princeton men were in service. The university laboratories were occupied by Government bureaus of research, and the dormitories by a school of aviation, a naval paymaster school, a student army training corps and a naval training unit. The atrium of Nassau Hall was converted into a memorial of the 150 men who died in service and a scholarship was founded in memory of each.

*Additional Departments.*—In 1913 the erection of the residential graduate college rendered permanent what had been an experimental feature of the Princeton Graduate School. By maintaining the highest standards and limiting the number to 200 (1922) the Graduate School planned to meet the need for gifted young scholars. A School of Architecture, opened in 1920, was developed within the department of art and archaeology. The School of Engineering was in 1921 reorganised to lead to the degree of B.S. in Engineering, and to offer graduate courses leading to the degrees of C.E., E.E., M.E., E.M. and Chem.E. The separate School of Electrical Engineering, established in 1889, was absorbed by the School of Engineering. Other new departments were those of psychology (separated from philosophy); politics (separated from history); music; and military science. New professorships were endowed in history, mediaeval history, Spanish, chemistry and ancient literature. After the War a field artillery unit was established and erected into a Department of Military Science.

*Scholastic Changes.*—The entrance requirements were revised in 1913 and 1919. To place the university in closer touch with American secondary education, Greek was no longer required (though strongly advised) for the A.B. degree. The curriculum was remodelled in 1919, and in 1923 new standards for bachelor degrees were put into effect. The elective principle was broadened by a new plan of upper class study, developing the application of the preceptorial system. Meanwhile the enrolment reached the capacity, 2,000, set by the university. To keep within this number, a plan of selective admission to the freshman class was adopted in 1923.

In 1919 the Alumni Association of Nassau Hall founded in 1826 was reorganised into a national association, and in 1922 the number of trustees elected by the alumni was increased from five to eight, or nearly one-fourth of the board.

*Endowment and Buildings.*—The inadequate endowment after the World War led to a campaign, and the raising of about \$9,000,000. A bequest from the late Henry C. Frick, not fully received in 1925, was expected to amount to about \$5,000,000. A permanent committee was appointed in 1925 to obtain an additional endowment of \$20,000,000.

During the period 1912 to 1925, 22 new buildings were erected, and the foundations were laid (1925) of a new chapel. Among these buildings were the Graduate College, two units of faculty apartments, six dormitories, a new infirmary, a psychological laboratory, university dining halls, a stadium, a rink, a university power house and permanent quarters for the field artillery unit. In 1912 the endowment was \$5,194,861, income \$766,943, disbursements \$831,538, salaries and expenses \$408,360. In 1925 the endowment was \$15,159,393, income \$1,835,091, disbursements \$1,873,166, and salaries and expenses \$1,690,999. The library grew from 337,965 vols. in 1912 to 576,849 in 1925, not including 286,851 pamphlets, manuscripts, etc. In the same period the faculty increased from 182 to 260, the graduate enrolment from 152 to 196 and the undergraduate enrolment from 1,391 to 2,270.

(V. L. C.)

**PRINTING** (see 22.350).—Since 1910 many improvements have been made in high speed machinery and in mechanical details.

*Linotype.*—The linotype machine has been improved and is made with four main magazines, each containing a complete range of types of a different body or face. A lever changes the magazine, and the width of the mould can be altered quickly so that varying types and sizes can be set without delay. Side magazines, worked by an additional keyboard, are fitted, which will set much larger type on the normal body, the letters overhanging and being supported by leads or slugs.

*Monotype.*—The monotype has a greater range of faces which can be set at one time. The machine will set solid type up to 24 points at a much slower speed, and also overhanging initial letters which are larger than the normal body. The improvements on both machines are very useful for catalogue and newspaper work.

*The Ludlow.*—In the Ludlow the matrices of the type are set by hand, and clamped in the machine, which casts a solid line of type, and the matrices are returned to the case by hand. This machine is used entirely for display work or advertisements, and large types, with an overhang supported by slugs, can be cast. A wide range of faces and sizes in unlimited quantities, or repetition lines, can thus be obtained, and the type is always cast afresh for each job. The Supertype composing machine matrices are set in a manner similar to the linotype, but single letters are cast instead of a slug for each line.

*Automatic Feeder.*—The use of automatic machines to feed the sheets of paper to the printing machine has been widely adopted, and continuous running is possible for long periods, whereas with hand-fed sheets it is necessary to stop the machine frequently when a fresh supply of paper is put on the feed board. Mechanical feeders are of the "pile" or the "continuous" type. In the pile feeder a stack of paper is automatically raised as each sheet is separated and lifted by air suction, and passed down a sloping board to front lay marks, and adjusted by moving side marks which place the sheet in the exact position for the grippers on the printing cylinder. Electrical or mechanical devices stop the machine if two sheets or no sheet be fed in by error. In the continuous type of feeder, small quantities of paper are placed and combed out by hand on the feed board, and then mechanically fed to the machine by somewhat similar means. With these mechanical feeders a higher output is obtained, and in large sizes a stack of paper can be wheeled on a trolley to the feeder. An extended delivery carries the printed sheets beyond the machine to a delivery board which descends gradually, and a truck load of paper can be wheeled away without handling to the binding department, and thus much handling and time is saved. The smaller sizes of printing machines are now built with an automatic feeder as an integral part of the construction, and speeds up to 4,000 per hour are possible, which could not be attained on a hand-fed machine.

*Process Work.*—Three-colour printing is used in increasing quantities for illustrations of all kinds. Absolute accuracy in register, height to paper, etc., is essential, and many improvements have been made. Blocks before being printed are gauged to 1,000th of an inch, and underlaid to make them dead-level. If a large edition be required, and plates are used on a flat bed printing machine, steel mounting blocks, planed to 1,000th of an inch, built up in small sections, with screws for adjusting the position of the plates, give a flat hard printing surface and perfect register between the three or four colour plates. Less time is then taken in making ready, and with modern machinery long runs of colour work can be obtained at a high speed without showing bad register or signs of wear.

Good colour printing requires uniform lighting, and special electric lamps have been perfected to give the effect of sunlight or northlight, and so enable printing to be carried on day or night without the variation caused by changing from natural to ordinary artificial light. The expansion and contraction of paper caused by variations in temperature or humidity prevent good register, essential in colour printing. Self recording hygrometers and thermometers are used to overcome these difficulties.

*Newspaper Work.*—In newspaper printing there has been a steady improvement in details. Most of the daily papers now have a page devoted to half-tone illustrations, which were formerly restricted to the daily papers specialising in pictures (see *NEWSPAPERS*). The growth in the circulation of the newspapers has been aided by the increased output of the modern newspaper printing machine. The running speed of the machines is much higher, and the following are the principal improvements. Roller bearings have been fitted to the printing impression cylinders, and ball bearings to some of the other moving parts, in order to reduce friction and give smoother and easier running. For the inking rollers, which are covered with a rubber-like coating made of glue, treacle and glycerine, a new non-melting composition has been invented which enables the machines to run at a higher speed. A fine spray of ink is forced under pressure through a number of minute holes upon the rollers, supplying a continuous and uniform quantity of ink when the machine is running at a high speed.

*Costing Methods.*—Mention may be made of the development of proper costing methods in the printing trade. This movement began in the United States and spread later to Great Britain, with the result that in both countries a uniform system has been officially adopted. The system leads to many improvements, and points out the high cost of running obsolete and inefficient machinery, and where losses are incurred. The methods of dealing in paper have been standardised, first in Great Britain and afterwards in the United States. The sizes have been fixed and the ream containing a variable number of sheets abandoned in favour of 1,000 sheets as a basis for selling, which gives the advantage of decimal calculations. Other investigations are being made in order to standardise and simplify the methods which have been the slow growth of centuries.

(W. H. HL.)

#### PRESSES OF VARIOUS KINDS

*Styles of Presses.*—Four styles of presses were in common use in 1910 in book and job offices: platens, drum cylinders, stop cylinders and two-revolution cylinders. In the platen press the form was held in a perpendicularly stationary position, the printing surface, or "platen," opening on a hinge movement during the feeding of the sheets and while the inking rollers were passing up and down over the surface of the type forme. The drum-cylinder press was so called because of the resemblance of the end view of its impression cylinder to a large drum. Enough of the circumference of the cylinder was cut away to permit, after the impression had occurred and without stopping the cylinder, of the return of the type forme for re-inking and another impression. In the stop-cylinder press, only a small part of the circumference of the cylinder was cut away; the cylinder, which was of course smaller in size than in the drum, stopped with its flat side at rest over the forme, which thereby was provided with sufficient headroom for its return. In the two-revolution press the cylinder was not stopped but was automatically raised and, while the forme was returning, the cylinder made a second revolution. The motion lost by the stopping of the cylinder in the drum- and stop-cylinder presses was saved in the two-revolution press, thereby giving it greater speed and consequently more production.

Printing of newspapers of all but limited circulation was done on rotary presses. The forme was stereotyped in a half-circle, two pages encompassing each cylinder, which in printing rotated against the impression cylinder, lost motion being avoided and the ultimate in speed seemingly achieved. The presses were built on the "deck" system, one unit above another. The paper was fed from a roll at one end and came out at the other as completed and folded newspapers. In lithographic printing the stone carrying the printing surface was just beginning to give way to zinc and aluminium sheets for the same purpose. "Straight matter" composition was done on two type-casting machines, one producing single types and the other producing completed lines or "slugs."

The situation in 1926 was as follows:—

The platen press was still much used. For short runs it continued to be hand-fed; for long runs it was equipped with automatic feeding devices that greatly augmented production such as those described above. Both drum-cylinder and stop-cylinder presses had practically disappeared. The two-revolution press had been developed to a high state of perfection; it was built in small and large sizes and also for printing in two colours at one operation.

Automatic job presses have come into general operation since 1910. Three of them are the Kelly, which embodies the principle of the two-revolution cylinder press; the Miehle vertical, which is in effect a fast small stop-cylinder with a vertical stationary form; and the Miller high-speed press, which has a two-revolution movement with the difference that the bed and not the impression cylinder moves up and down.

*Rotary Presses.*—The rotary principle still prevails in newspaper offices, but the "deck" style of construction has been abandoned for what is called the "multiple unit" basis. Under this system, when additional equipment is required one press is not superseded by another; a unit is simply added and thereby a sextuple becomes an octuple, an octuple a decuple, etc. The presses are built heavier and stronger. The old method of hand stereotyping has been superseded by autoplating. A further development in press construction, known as the "tubular" system, has been perfected. By its use each plate is cast as a tube instead of in semi-circular form. This tube is slipped over a cylinder, which prints a complete page with every revolution.

The rotogravure press (see *PHOTO-ENGRAVING*) is making rapid strides in the newspaper field, and may be expected in time to play an important part in the commercial and book printing fields also. Most illustrated Sunday supplements are printed on rotogravure presses.

*Lithography.*—In lithographic printing, the stone from which impressions were formerly taken has almost completely disappeared. In its stead are zinc and aluminium sheets which, encircling the printing cylinder, permit the complete application of the rotary principle to lithographic production also. A further development is what is known as the "offset" process, in the operation of which the design to be printed is first transferred to a rubber blanket, from which it is again transferred to the paper. Whereas formerly only smooth-surfaced, specially prepared papers could be printed upon lithographically, by the offset method any paper, whether smooth- or rough-surfaced, may be used with equal facility. Offset seems to be particularly adapted to colour work.

*Tonnage Production.*—A new field, sometimes known as "tonnage production," concerns itself with magazine printing and is the outstanding development in printing machinery during the 15 years ending in 1926. Whereas only a few years earlier a circulation of 500,000 copies of weekly and monthly periodicals, printed in one colour, was a rarity, in 1926 four and five times that number, with almost numberless pages in two and four colours, is accepted as nothing out of the ordinary.

*Offsets.*—Tonnage production in one colour presented only a single problem, which was that of quickly drying the sheets. The prepared surface on a cylinder against which a sheet is pressed in the impression contact is called a tympan. When a sheet is printed on both sides during a continuing operation, the printed side is likely to smudge the tympan as the blank side is taking the impression: this smudge when it appears on the next printing is known as "offset." When properly controlled, as in lithographic printing, offset becomes a process and produces fine effects. In relief printing, on highly surfaced papers, however, offset must of necessity be eliminated. Offset is not a problem in newspaper production, for the reason that printing on newsprint dries quickly, but the case is different with printing on supercalendered and coated papers, such as must be employed for the half-tone and process plates with which magazines are illustrated. At first the remedy was believed to be found in a "shifting tympan" that changed the surface at intervals, but the device was abandoned because of the time required for the shifts.

FIG. 1. Goss Unit Type Octuple Press 174-A, for printing newspapers and delivering them (centre of picture) folded to half-page size and counted; size of page usually about 17x23 inches. Speed of 72,000 copies, 16 pages, per hour, or 36,000 copies, 32 pages. Requires 75 horsepower. FIG. 2. Kelly Press, Model 2; prints paper from 8x12" to 22x34" at 2,000 to 3,000 impressions per hour. The automatic feeder (at left end of picture) holds a stack of paper up to 21½". The press delivers the printed sheets into a jogger-box or layboy, the bottom of which is a truck (right end of picture). As the load increases the truck is lowered, and the fully loaded truck is then hauled away without further handling of the paper. FIG. 3. Michle Vertical Press; prints paper from 3½x5½" to 12½x19" at from 2,500 to 3,600 impressions per hour. Requires 2 horsepower. FIG. 4. Cottrell Multi-colour Sheet-feed Rotary Press, printing 4 colours simultaneously on one side of the paper, in sheets up to 47x69" at 2,700 to 3,000 copies per hour. It prints from curved electrotypes.

*The Cottrell Rotary Press.*—The late Mr. C. B. Cottrell, founder of C. B. Cottrell and Sons Co., solved the problem with the Cottrell Rotary Press. It provided an automatic shifting tympan that furnished an entirely new and clean impression surface as often as necessary to prevent offset. This press, with roll feed to print on both sides of the web, had all the fine printing qualities and conveniences of the flat bed press, plus the speed of the rotary, and met at high speed all the requirements of printing without smut or offset. The shifting tympan has been superseded by a "travelling offset" web. The Cottrell Co. added colour cylinders to the printed units and so perfected two colours on each side of the web, and, in subsequent developments along the line of multi-coloured printing, has produced a rotary perfecting press, printing from a roll of paper and producing four colours on one side and two or four colours on the other side of the web.

A further improvement is the McKee process for colour printing, which produces a printing plate having graduated elevations on its printing surface, corresponding in order with the solid or dark tones and the intermediate tones of the subject on the face of the plate, varying in structural thickness in accordance with the several pressures required for printing and in accordance with the various tones of the subject on the face of the plate. Such a printing plate has the sections which are designed to print the darker shades permanently elevated above the levels of the sections adapted for the lighter shades, and the levels are graded one into the other from the permanently elevated parts to the lightest printed shades, so that in profile the plate is uneven or irregular in its printing surface and level on the back. The usual underlays and overlays are not required, since their effects are produced on the face of the plates, and the "strike-off" between the cut overlay and plate which happens so often is obviated.

In short, a printing plate is produced wherein the required make-ready is permanently produced in the face of the plate. Until the McKee process was perfected and used in conjunction with the Cottrell multi-colour press, it was customary to print only one colour at a time at each passage of the sheet through the press, requiring as many separate and independent printings as there were colours required. By the McKee process, colour printing can be produced on presses having one impression cylinder common to all of the plate cylinders. The Cottrell multi-colour press produces by a continuous operation that consists of one passage of a sheet through the press a picture in which the different colour values are effectively brought out.

See G. T. Jacobi, *Printing* (1919); J. Southward, *Modern Printing* (1922).

**PRISONERS OF WAR.**—The procedure laid down by international agreement for the treatment of prisoners of war under the Hague regulations was severely tested during the World War. In the first place, it must be borne in mind that Great Britain, France, Italy, Germany and Austria together claim to have taken not less than 6,000,000 prisoners, while Austria admits having lost 1,500,000 prisoners to Russia.

Of the 200,000 British prisoners of war more than 90% were taken by the Germans, the remainder being principally in Bulgarian and Turkish hands. The following brief account will, therefore, deal for the most part with the treatment and experience of British prisoners of war in Germany and conversely of German prisoners of war in Great Britain. For this purpose three divisions will be made, namely, civilian or non-combatant prisoners; officers; and rank and file.

*Civilians.*—The internment of large numbers of civilians had not been contemplated by the framers of the Hague regulations, and therefore presented an entirely new problem. By the end of Nov. 1914, some 29,000 Germans were interned in Great Britain, while in Germany more than 112,000 civilians, of whom not more than 6,000 were British, were in a similar position. In both countries accommodation was at first definitely bad. Newbury race-course was one of the first internment camps in England. The German reply to this was Ruhleben race-course. Newbury

was abandoned after a few weeks, but Ruhleben remained the principal civilian camp till the end of the War. Decidedly bad at first, conditions there gradually improved, largely as a result of the efforts of the prisoners themselves.

Civilian prisoners were in neither country compelled to do any work beyond what was necessary for the cleanliness and order of their camps. In Great Britain, however, civilian prisoners were given the opportunity to volunteer to work, and some 1,500 were given employment, mainly in agriculture. In Great Britain each internment camp had its own small hospital. At Ruhleben the medical arrangements were at first quite inadequate, but later they improved considerably.

*Officers.*—The treatment of all combatant prisoners in Germany, officers and men alike, varied greatly with the situation of the camp, and particularly with the personality of the commandant. In the X. Army Corps district, for example, all prisoners came under the malign influence of Gen. von Hainisch, who invariably appointed men of his own kidney as camp commandants. Accommodation ranged from comfortable hotels, as at Augustabad, to badly constructed huts, as at Strohen, near Hanover. Fuel was always scarce, in some cases, as at Holzminden, practically non-existent.

As regards food, the insufficiency and unsuitability of the German rations made the prisoners almost entirely dependent on parcels from home. It is to the credit of the German authorities that the majority of these parcels arrived intact. No work was required of officers; and for the care of the camp, orderlies, usually of the same nationality as the officers, were provided in most cases. The most serious complaints that can fairly be made on behalf of officer prisoners in Germany are shortage of fuel, inadequacy of cooking arrangements, and especially in the X. Army Corps district, the determination of the camp commandants to prevent the prisoners from introducing any degree of comfort into their situation.

German officers were confined in England in large country houses and public institutions. It can fairly be said that on the whole they were better fed and housed than British officers in Germany, and the facilities provided for their recreation were much more adequate.

*Rank and File.*—While the experiences of civilian and officer prisoners of war are of considerable interest, it is undoubtedly by their treatment of the rank and file prisoners that the nations concerned must be judged. All belligerents compelled prisoners to work, as they were entitled to do, provided that prisoners were not compelled to undertake work directly connected with the military activities of their captors. According to numerous reports, all the belligerents at various times broke this rule in the spirit at least; and Germany several times broke it in the letter.

Camps were of two principal classes, main camps and working camps. The former were usually composed of hutments similar to those seen in the English temporary military camps, the whole being surrounded by barbed wire, and frequently subdivided by barbed wire into sections. The outstanding complaint from British prisoners regarding the main camps in Germany seem to be on the ground of overcrowding—at Wittenberg, for instance, 15,000 to 17,000 men were confined in an area of about 10 acres. As regards accommodation working camps varied enormously. Men sent to work in factories were sometimes housed in quarters normally provided by the employer for bachelor workmen; men working on farms lived in small camps erected near the farm or occasionally in the farm buildings themselves. Treatment in such quarters likewise varied with the personality of the employer or of the non-commissioned officer in charge of the camp or compound. On the whole the German non-commissioned officer was a harsh and frequently brutal commandant. The discipline in German factories, mines and the like was at all times very severe; and apart from disciplinary measures, too many authentic cases of gratuitous brutality have been recorded against the German authorities, particularly against non-commissioned officers in charge of working parties.

*Reprisals.*—Hard though the lot of the prisoners of war set to work in factories and mines undoubtedly was, the most

terrible chapter of the sad story concerns those unfortunate individuals selected as the subjects of reprisals by their captors. This barbaric method of avenging wrongs inflicted on their subjects was employed by all the belligerents from time to time, but authoritative evidence shows that Germany was in this respect by far the worst offender. One of the most notorious examples of German reprisals was the transfer of 500 British soldiers to the Eastern Front in Feb. 1917. After being forced to march long distances through appalling country, with insufficient food and clothing, these unfortunates were housed in a tent pitched on the snow beside the frozen river Aa, within range of the Russian guns. Many of the men died and many others lost fingers and toes through frost-bite.

*Organisations for Prisoners.*—The relief of prisoners of war was at first left in the various countries to individuals. It consisted inevitably in the sending of parcels of food and other necessities. In Great Britain, whose subjects were much worse off than were the German prisoners, it gradually became clear that some control of the parcel supply was required, as individual enterprise resulted not only in an unfair distribution of parcels, but also in an imperfect selection of commodities to be sent. Early in 1915, a Prisoners of War Help Committee was established in London. Having no authority, however, it was a comparative failure, and in Sept. 1916, it was superseded by the Central Prisoners of War Committee of the British Red Cross and Order of St. John. This body had absolute control of parcels and from its inception till the end of the War maintained a steady stream of suitable parcels to all ranks.

*Repatriation.*—By Aug. 1915, the British and German governments had reached an agreement regarding the repatriation of officers and non-commissioned officers incapacitated by wounds or illness from further active participation in the War. Further agreements were subsequently reached providing that prisoners less seriously wounded or ill, and prisoners who had been in captivity for over 18 months, might be sent to Holland or Switzerland for internment there. Immediately after the Armistice, the repatriation of all prisoners commenced, but owing largely to transport difficulties it was several months before the undertaking was completed.

*Turkish and Bulgarian Prisoners.*—British soldiers who were captured by the Turks have brought very serious charges against their captors. Officers, particularly those of high rank, appear to have been treated with almost theatrical courtesy; but the rank and file were subjected to appalling hardships, being housed in quarters which were nothing short of filthy, and fed and clothed in a manner deserving of the severest censure. Many of the prisoners died and many more returned after the War completely broken in health.

The Bulgarians, once they understood that the somewhat primitive disciplinary methods employed in their own army were quite unsuitable and unnecessary in the case of British soldiers, treated their prisoners with quite a reasonable degree of humanity, and fed, housed and clothed them as well as could be expected, having regard to the resources at their disposal.

**BIBLIOGRAPHY.**—A large number of reports were rendered at various times by the United States on the treatment of prisoners of war in Great Britain and Germany; and a considerable amount of correspondence took place between Great Britain, Germany and Turkey. Of non-official works, J. W. Gerard's *My Four Years in Germany* (1917) is perhaps the most reliable. For a picture of life as an officer prisoner in Turkey see E. H. Jones, *The Road to Endor* (1920).

**PROBABILITY** (see 22.376).—1. The relation of the mathematical theory of probability to other branches of science has altered to some extent. From being a separate subject, providing interesting problems to the mathematician, it has almost come to be a part of a larger subject, the theory of statistical frequency; at any rate it is one of the aspects in which statistical frequency may be studied. The theory of probability was originally concerned mainly with games of chance, and to some extent also with vital statistics. The discovery of the "law of error" brought all scientific observations into its field. And it has received a great stimulus from the statistical study of variation

and correlation, mainly arising out of Francis Galton's investigations of heredity. This has led to some reconsideration of principles.

2. *Typical Questions.*—A box contains 5 balls, all, so far as we can see, exactly alike, except that one is red and the remaining 4 are white. A ball is drawn at random from the box. What is the probability that it will be the red ball?

A reasonable answer, but a provisional one (see para. 8), is that the probability is  $\frac{1}{5}$ . But, before we give this answer, the question itself gives rise to several questions. What do we mean by "at random?" What do we mean by "probability?" In what sense can a probability be a number, or be measured by a number? Why does the number necessarily lie between 0 and 1? How is this number, which is or measures the probability, to be ascertained? And at what stage of the proceedings does probability, as such, cease to exist? We say that a ball "is drawn;" do we mean that it is going to be drawn, and that the probability that it will be the red ball ceases to exist as soon as the ball is drawn? Or, supposing the ball has been drawn and we do not know which ball it is, can we say that the probability that it is the red ball is so-and-so?

3. *Measurement of Probability.*—For numerical measurement of probability there seem to have been three methods used; each of them leads to 1 as the measure of certainty.

(i) The study of probability was originally, in the main, the scientific study of gambling. If  $A$  has a chance of winning a prize  $X$ , the primary object was to find  $V$ , the value of his chance. The ratio of  $V$  to  $X$  is a fraction between 0 and 1, which may be called the probability of  $A$  winning the prize. In the present case, suppose there are 5 persons, each of whom in turn is to draw a ball, and that whoever draws the red ball is to get 10 shillings. Then it will no doubt be agreed that each person's chance of drawing the red ball is worth 2 shillings; each person's probability of drawing this ball can therefore be said to be  $\frac{1}{5}$ .

(ii) The rule usually given in text-books is as follows: If an event can happen in  $N$  ways, all of which are equally likely, and if  $P$  of these ways are called "favourable," then the probability of the event happening favourably is  $P/N$ . One objection to this is that it introduces a new phrase, "equally likely," without defining it. If what is meant is that the numerical probabilities are equal, we are working in a circle. Another objection is that it does not cover all cases.

(iii) The modern idea is to base the probability on statistics. To find the probability that under conditions  $C$  an event  $E$  will happen, we enquire as to the relative number of cases in which it actually does happen. If we find, or if it is reasonable to suppose, that in  $N$  cases in which the conditions  $C$  are created it happens in  $pN$  cases, we can say that the probability of it happening under these conditions is  $p$ . It is assumed, of course, that its happening or not happening in any one case is not affected by its happening or not happening in any other case.

The adoption of the statistical basis disposes of a good many difficulties. If, for instance, the ball has been drawn, so that it is definitely red or white, but we do not know which, we can speak of the probability that it is red; for we are dealing statistically with the class of cases in which the ball has been drawn, and are considering, out of these, the cases in which the ball is red.

4. *Randomness.*—The expression "at random," or *randomness*, does not seem, at any rate on the statistical basis, to mean anything more than that we are dealing with a question of chance. To say "A ball is taken at random, the chance that it will be red being  $\frac{1}{5}$ " is the same as to say "A ball is taken under such conditions that the chance that it will be red is  $\frac{1}{5}$ ."

5. *Mathematical Treatment.*—The treatment of a problem in probability usually consists of three stages:—(1) the numerical determination of probabilities, either of single events or of joint occurrence of events (2) the deduction, by mathematical methods, of other probabilities (3) the application of the results so obtained. We have so far dealt with (1). We have now to consider (2). The mathematical treatment involves the addition and multiplication of probabilities, and the inverse processes, subtraction and division. These processes follow certain rules.

(i) The *addition rule* is that if an event  $C$  (e.g., the drawing of a ball from a box) can be associated with one or other of two events  $E$  and  $F$  (e.g., the ball drawn being red or being white) but not with both, and if the probability of  $C$  being associated with  $E$  is  $p$ , and the probability of  $C$  being associated with  $F$  is  $q$ , then the probability of  $C$  being associated either with  $E$  or with  $F$  is  $p+q$ .

(ii) The *multiplication rule* is that if the probability of  $C$  being associated with  $E$  is  $p$ , and if, in the cases in which  $C$  is associated with  $E$ , the probability of  $D$  being associated with  $G$  is  $r$ , then the probability that  $C$  will be associated with  $E$  and  $D$  with  $G$  is  $pr$ . (This form of statement avoids the introduction of "independence" of probabilities.) These rules are sometimes stated as theorems, sometimes as axioms. They are both deducible from the statistical definition given in (iii) of para. 3.

6. *Inverse Probability*.—A class of problems of increasing importance is that of determining the probability that an event  $E$  has been preceded by an event  $C$ , this being one of a definite number of possible and mutually exclusive antecedent events  $C, C', C'' \dots$ . Such a probability is often called an *inverse* or a *posteriori* probability; the probability of an event  $C$  being followed by an event  $E$  being called a *direct* or *a priori* probability. The treatment of "inverse probability" cases has sometimes been discredited, not without justification; the problems which mathematicians have set have often been impossible of solution, on account of the data being insufficient, and arbitrary assumptions have had to be made.

The following may be taken as a typical question in inverse probability. A box contains 5 balls, 1 of which is known to be white and 3 red, the remaining one being either white or red. A ball is drawn and is found to be white. What is the probability that the box contained 2 white and 3 red balls? It is impossible to answer this question without further information. The box has been filled in some way: the method of filling having led to the box containing 1 white and 3 red balls, we require to know the probability that it will lead to the other ball being white or being red, respectively. When we know this, the problem is a straightforward one, if we use the statistical method.

Suppose that the probabilities in question are  $\frac{3}{4}$  and  $\frac{1}{4}$  (as might possibly be the case if the box were filled from a source containing white and red balls in the ratio of 3 : 4). Then we may express the problem as follows: There are "W" boxes containing 2 white and 3 red balls, and "R" boxes containing 1 white and 4 red balls; their frequencies being in the ratio of 3 : 2. A box is taken at random; and a ball is drawn from it and is found to be white. What is the probability that the box is a W box? From the data we get the following (Table I.) as a representative frequency-distribution for 1,000 such drawings:—

TABLE I.

|                  | From W boxes | From R boxes | From all boxes |
|------------------|--------------|--------------|----------------|
| White ball drawn | 240          | 80           | 320            |
| Red ball drawn   | 360          | 320          | 680            |
| Total drawings   | 600          | 400          | 1,000          |

It will be seen that the required probability is  $240/320 = \frac{3}{4}$ . (This can be verified by using the ordinary method.)

Now compare the above question with the following. A man being called short or tall according as his height is under or over  $67\frac{1}{2}$  in., suppose that, in a community in which every man has one son who attains maturity, the statistical relation between height of father and height of son, in a representative 1,000 pairs of father and son, is given in Table II.:—

TABLE II.

|            | Father Short | Father Tall | Total Fathers |
|------------|--------------|-------------|---------------|
| Son short  | 250          | 89          | 339           |
| Son tall   | 215          | 446         | 661           |
| Total sons | 465          | 535         | 1,000         |

What is the probability (a) that the son of a tall father is tall, (b) that the father of a tall son is tall? The answers are (a)  $446/535$  (b)  $446/661$ . If we make a distinction between "direct" and "inverse" probability then, since the father precedes the son, (a) is a case of direct and (b) a case of inverse probability. But in which category are we to put such a question as:—What is the probability that a girl with fair hair has blue eyes? It is clear not only that there is no fundamental difference between the two classes of cases, but that, if we do make a distinction, we must introduce a third category, that of probabilities with regard to concurrent events.

7. *Errors of Randomness*.—The distribution in Table I. is a representative distribution, i.e., the numbers in the different compartments of the table are exactly proportional to the corresponding probabilities. But, if 1,000 boxes were taken at random in the way described and balls were drawn at random from

them, these exact numbers would not be likely to appear. The differences between the actual numbers obtained and these theoretical numbers are the *errors of randomness*, or *errors of random sampling*. The consideration of the relative frequencies of errors of this kind constitutes the *theory of error*, which is the main link between the theory of probability and the theory of statistical frequency. It forms a large part of the former, and is a particular case of the latter.

8. *Lack of Finality*.—We may revert, finally, to the question put at the beginning of para. 2. We said that, on the data, we may reasonably say that the probability of the red ball being drawn is  $\frac{1}{5}$ th. But this is only a provisional estimate, the test of which is the result of actual drawings. If we find that the red ball is drawn more often than each one of the white balls, we must conclude that our original estimate of the probability was wrong, and must modify it accordingly. This is, in effect, using the statistical basis. But even this basis only enables us to obtain an approximate value, which is liable to be modified by further statistics. It is never possible to find the true value of any particular probability. And the problem of determining the best value, being based on an investigation of past facts, is really a problem of inverse probability.

REFERENCES.—For a quite elementary view of the theory of probability, reference may be made to W. A. Whitworth's *Choice and Chance*, or to chapters in some work on Algebra, such as those of G. Chrystal or H. S. Hall and S. R. Knight. The principles of the subject were considered by J. Venn, *The Logic of Chance* (1st ed. 1866); this is still the standard work. J. M. Keynes, *A Treatise on Probability* (1921), deals with the logical foundations of probability, whether capable of numerical measurement or not. On the statistical side, G. U. Yule, *Intro. to the Theory of Statistics* (1911), is of value, especially as regards the theory of sampling. A. L. Bowley, *Elements of Statistics* (4th ed. 1920), is more advanced. A very full mathematical equipment is provided by E. T. Whittaker and G. Robinson, *The Calculus of Observations* (1924). A considerable number of books on the mathematical study of statistics have appeared. The annual volumes of *Biometrika*, from 1902 onwards, are indispensable to the serious student. (W. F. S.)

**PROBATION** (see 22.404c).—Probation, as a system of release from court without commitment to prison or reformatory, originated in Massachusetts, U.S.A. in 1878, and has been extended by law to every state of the United States and to the territory of Hawaii. Twelve states limit probation to juveniles under 16 or 21 years of age; several others use it only for first offenders or for special classes of cases. Massachusetts has probation officers in every court in the State. Many states have them only in the larger cities. Probation work is supervised by a State Probation Commission in Massachusetts and New York State and by a State Probation Dept. in Indiana. A 1925 directory of probation officers includes names and addresses of 3,028 probation officers in the United States and 107 in Canada. The National Probation Assn. (370 Seventh Avenue, New York City) stimulates the development of probation and holds annual conferences.

Application of the probation system has not kept pace with the law. An investigation showed that children's courts empowered to use probation, and disposing of 175,000 cases a year, had probation officers in only one-half of the courts. During 1923 there were 29,763 placed on probation by all courts in Massachusetts and 24,033 in New York State. Approximately 400,000 were on probation during the year in the whole United States. Studies of results of probation show that from 44% to 75% are genuinely improved.

*Law of 1925*.—The most significant advance in the probation system in the United States was the passage of the first Federal Probation law, May 1925. This authorises district courts, after convicting for any offences except those punishable by death or life imprisonment, to suspend sentence and release on probation for a maximum period of five years. Federal judges may appoint probation officers to investigate cases referred by court and to aid in bringing about improvement in conduct and condition of probationers. After governmental appropriations are made, salaries may be fixed by judges subject to approval of the attorney general. Appointments of salaried officers are by

<sup>1</sup>Adapted from K. Pearson and A. Lee, *Biometrika*, vol. ii (1903), 415.

competitive civil service examination. In some districts, county and city probation officers have volunteered to serve as Federal probation officers.

The probation system has extended rapidly to all parts of the world and is being applied increasingly in children's courts. Of 14 European countries where inquiry was made in 1925, 12 had probation laws; in 11, probation officers were paid by state or municipality; 1,380 salaried probation officers were reported. Among the countries which have adopted a probation system are England and a number of British colonies, Austria, Belgium, Denmark, Greece, Holland, Norway, Poland, Spain and Sweden. The juvenile court in Paris employs a salaried probation officer. England has a national association of probation officers. (See BORSTAL SYSTEM.) (M. M. H.)

**PROCESS:** see PHOTO-ENGRAVING.

**PRODUCTION, CENSUS OF.**—The census of population, regularly repeated in most civilised countries, furnishes an indication of the numbers of workers at the ages most important for productive effort. When associated with a record of the occupations of the working population, an index to the distribution of the productive energies of the community in various directions is furnished. The grouping of the population by the industries in which they are engaged furnishes further valuable material for a general survey of resources. This grouping, undertaken in this country at the population censuses of 1911 and 1921, is in some cases, as in Germany, made the object of an independent inquiry, the numbers of establishments and of the persons employed by them being ascertained for each industry. Inquiries of the character referred to above furnish no information regarding the amount and character of the products of the various industries.

*Agriculture.*—In many, indeed in most, countries no general survey of the products resulting from the labours of the inhabitants is carried out. In countries mainly devoted to agricultural industry, the ascertainment of the distribution of the cultivated area among its principal uses, and of the quantities of the leading crops and the numbers of livestock maintained, give information of the greatest importance relating to the country's production. Where the extraction of minerals is important, the quantities of such minerals produced are a necessary element in the survey of the country's industrial resources. In various countries in which manufacture has reached a considerable degree of importance, periodic returns of the output of various leading products of the manufacturing industries are added to the records of agricultural and mineral products obtained. These surveys are, however, not merely incomplete in the degree in which they do not cover the productive activities of the country, but fail to furnish a satisfactory measure of the results of that activity. For that purpose a census not of products but of production is needed. For the extractive industries the record of products serves to measure production reasonably well, since the value of the products of other industries used up in the processes essential to the extraction of new products is, in general, comparatively small in relation to the value of the new products secured.

Even in the case of field crops, however, the seed required is often an important fraction of the crop secured, and a record of the quantities harvested does not furnish figures of the amounts that are available for consumption in or for sale beyond the limits of the country under consideration. A sound estimate of the "production" of agriculture would need, indeed, a deduction from the gross total of crops harvested not only of the seed which has been required to produce those crops, but also of the equivalent of manures used and of the requirements for the replacement of tools and equipment so as to maintain the stock of such tools, etc., undiminished. In dealing with animal products, allowances must, in like manner, be made for food consumed in the maintenance of the animals and for other supplies used up in the business of stock rearing, so far as these goods are obtained from sources beyond the limits of the agricultural industries under survey.

*Industry.*—The principles illustrated in these references to the distinction between a census of products and a census of

production have especial importance in reference to many manufacturing industries. While the progress of a given industry may be reflected in the quantities of certain products characteristic of that industry, so long as the structure of the industry remains without changes affecting the relative importance of these products in the industry as a whole, the comparison of different industries, and of different divisions of the same industry, cannot be made on the basis of the aggregate value of the products of the industries compared. There are two important reasons for this. On the one hand, if industries were otherwise similar in character, but made use of different materials, they would yield aggregates of products, the value of which would be higher or lower according to the values of these different materials. Materials costing £50,000 might be worked up into products worth £100,000, and precisely similar operations on materials costing £75,000 might yield products worth £125,000. Measured by the value of products, the second industry appears to have a yield 25% greater than the first, while the actual increments in value of materials used were the same in both cases.

On the other hand, the same materials may be advanced from stage to stage in manufacture in different establishments, and the products of the series of establishments will show values gradually increasing, the material of each being the product of the preceding. It would not be a sound conclusion from such a record that the productive importance of the successive establishments was in the order of the processes, and that the increasing values of the goods from stage to stage reflected the importance of the productive services of the series of establishments. In comparing establishments making use of different materials and conducting processes of manufacture dissimilar in character, as in the two types of cases dealt with above, no true comparison of the value of the productive contribution of each can be expected to result from a single comparison of the value of their products.

A census of production must, accordingly, be something more than an enumeration of the products of the various establishments and industries surveyed and a record of their values. The products of other establishments or industries which have been used up in the productive processes surveyed must be ascertained if a true measure of the production carried on is to be secured. In strictness the effects of wear and tear, so far as not made good by the staff maintained within the establishment for that purpose, and also the effects of obsolescence on the plant and buildings, should be evaluated and included in the deduction, from the value of the gross output, needed to arrive at the value of the contribution made to production. In practice detailed allowances for depreciation cannot be estimated with a precision approximating to that attainable with reference to cost of materials, and adjustments in respect of the consequent overestimate of the production have to be made by some means other than the simple aggregation of the depreciation suffered by each establishment. The result of deducting the value of materials used from the value of the products resulting from work on them is designated "net output" in the reports on the Census of Production in the United Kingdom and is dealt with under the title "value added in manufacture" in the reports on the Census of Manufactures in the United States.

In addition to an enumeration of the kinds and values of goods produced, there is needed, for a proper understanding of the significance of these data resulting from a census, a record of the numbers of persons employed in the production of those goods and of the mechanical aids to production at their disposal. Information as to the distribution of the value of the recorded production between wages, returns to capital, taxation, profits, etc., will also have much importance, in view of the reaction of distribution on productive efficiency; but inquiries regarding the distributive allocation of the values produced do not appear to be an essential part of the census of production itself.

Information on these matters, like information regarding the quantities and values of imports and exports of the various classes of goods with which the census is concerned, is of very great importance in the application of the results secured by

means of the census. The comparison of the imports and exports of any class of products with the amounts and values of similar products made within any country affords information of fundamental importance. For the aggregate of all industries it furnishes measures of the dependence of the material welfare of the country on its foreign trade. Further, since the material income of a country consists in the goods produced and in those which are obtained from abroad in exchange, a census of production furnishes a basis for measuring the amount of, and the changes in, the total income of the community. In so far, too, as capital goods and consumption goods are capable of distinction, the total of products applied to capital purposes, replacement and increase together, can be ascertained. The formation of a reasonable estimate of what is required for maintenance of the existing stock of capital enables an estimate to be made, of a corresponding degree of reliability, of the increase of capital. Thus results of uncertain estimates formed on other principles can be submitted to useful tests.

*Censuses in Different Countries.*—The United States has the longest record of periodic censuses of production, covering agriculture, mining and manufacture. The decennial census of population in that country was accompanied by inquiries into production from 1850 onwards. After 1900 these inquiries were made quinquennial and, since the close of the World War, have been biennial. In Canada, since Confederation, a similar series of production returns has been secured, and these have become annual since 1917. Australia, New Zealand and the South African Union have also annual returns of production in manufacturing as well as in extractive industry. In Europe similar inquiries have been irregular and relatively rare. The United Kingdom took its first Census of Production for the year 1907; the second, relating to 1912, was not completed owing to the War; and the third, relating to 1924, is in progress. No decision has been announced as to the resumption of the quinquennial series arranged to follow the first census or its replacement by a series at other predetermined intervals. In the Netherlands, war necessities led to the initiation of inquiries into production, and occasional inquiries have taken place in Sweden (1914-7), Norway (1909 and 1916), France (1800-12, 1845, 1861-5), Belgium (1880), Rumania (1901-2), Bulgaria (1922), Hungary (1899-1900) and Russia (1900 and 1908). A new census of industry in Russia was announced in 1926. Various countries have undertaken, annually or at longer intervals, a census of industrial establishments of a more or less complete census of products.

Particulars of the latest of the inquiries in the several countries mentioned above may be found in the bibliography below.

**PROFITEERING.**—This word came into colloquial use early in the World War, and, having been included in the title of an Act of Parliament in 1919, may be considered to have received official recognition as part of the English language. It signifies the making of an unreasonably large profit on the sale of goods or services, particularly those in common use.

## I. GENERAL

In normal times before the War, opportunities for making unreasonably large profits were to a great extent restricted by

the play of competition, and in fact competitive prices were widely regarded as being *prima facie* reasonable. No doubt an exceptional demand or an unexpected shortage of supply might lead to a sharp rise of prices and swell profits sometimes to an unreasonable extent. But for the most part movements were gradual; changes in prices and profits also served a social purpose in bringing about adjustments in supply and demand. When competition was excluded, the possibility of unreasonably large profits being made was obviously increased, and there was a widespread tendency on this ground to regard monopolies with suspicion. Some industries which could not ordinarily be run on competitive lines, or which tended to become monopolies, were consequently carried on as public undertakings, or were controlled by public authority as regards rates and conditions of trading.

This applied generally to railways and public utility services, such, for instance, as gas and water undertakings. For many years before the War there had also been a tendency for competition to be excluded to a greater or less extent in an increasing number of industries through the formation of trusts or combines. Though the selling prices fixed by such organisations were not in all cases higher than those which would have prevailed under competitive conditions, they were certainly higher in many cases; while even when they were not, a feeling was apt to arise where large profits were being made that the trust or combine in question was taking for itself an unduly large share in the economies effected by the elimination of the wastes of competition. The belief that unreasonably large profits were being made was undoubtedly the most powerful motive in the campaign for the control of trusts and combines in various countries.

*War Conditions.*—War conditions tended very greatly to increase the opportunities for profiteering. On the one hand insistent and insatiable demands arose for munitions and other supplies required in connection with the War; and, on the other hand, the available supplies of many articles were reduced below the normal. The circumstances of the time frequently made it impossible to effect as speedy an increase of production in response to the call of demand as would have been the case in peace time. Another factor which tended to swell prices and profits was monetary inflation. This meant a continuous increase of purchasing power and growth of demand without a corresponding increase in supply. Manufacturers and traders consequently found that they were nearly always able to sell their goods at rather higher prices than would have been required to recompense them for the cost and to yield a normal profit. It was not perhaps adequately recognised that in many cases some loss on capital account was being incurred at the same time, owing to the fact that when stocks had to be replaced or plant renewed the nominal capital ordinarily required for the purpose was no longer sufficient. In many trades, however, there can be little doubt that after full allowance was made for this, profits (whether reckoned in absolute amount or as a percentage on turnover) were much above the normal.

Various measures were taken during the War to restrict profiteering, especially in belligerent countries. These included the fixing of maximum prices, and in some cases of profit margins at each stage of production and distribution. Rationing of primal necessities served to distribute supplies evenly and to prevent them from being sold to the highest bidder. The weapon of taxation was also employed in the form of highly graduated income taxes, excess profits taxes, etc., to secure for the public revenue a substantial part of the high War-time profits made by private interests.

*Period of Post-War Readjustment.*—After the War, the universal hope was to get back to "normal" conditions, whatever these might be, as speedily as possible. Events, however, were to show that in many countries, especially European countries, the way to peace and prosperity was long and rough. As the result of a widespread continuance of inflation, profiteering was in some cases more rife after the War than during its continuance. Under conditions of extreme inflation, such as occurred in Germany in 1923, profiteering became widespread. The rise of

prices was so rapid that profits of hundreds or thousands per cent could be made by holding goods even for a few days. That, however, was a profit in paper marks, and it was obvious that paper marks, while circulating as currency, were entirely untrustworthy as a standard of value. The true position did not become clear until after a stable currency had been reintroduced. It was then seen that while a comparatively small number of persons had made and retained fortunes, a vast mass of people had been reduced to penury.

## II. PROFITEERING IN GREAT BRITAIN

*British Govt. Measures.*—In Great Britain, inflation reached comparatively small dimensions. Following the Armistice, the general level of prices was for a time downwards, and during this period many War-time controls were withdrawn. Subsequently, prices began to rise and continued to advance until the spring of 1920, when a rapid fall began. Public apprehension led in the summer of 1919 to the passing of an Act to check profiteering, commonly cited as the Profiteering Act 1919. This Act conferred upon the Board of Trade powers (a) to investigate prices, costs and profits at all stages; (b) to receive and investigate complaints regarding the making of excessive profits on the sale of any article to which the Act was applied by the Board of Trade, and after giving the parties an opportunity of being heard either to discuss the complaint or to declare the reasonable price for such articles, and to order the seller to refund to the buyer any amount paid in excess of such reasonable price, the board also having power, where it appeared to them that the circumstances so required, to take proceedings against the seller in a court of summary jurisdiction; and (c) to obtain from all sources information as to the nature, extent and development of trusts and similar combinations. The Act was to remain in force for six months only, but it was subsequently continued for a further three months, and later, by an amending Act, for six months more until May 19 1921.

To deal with retail trade, local committees, numbering in all over 1,800, were set up, and the Board of Trade delegated to them the bulk of their powers under the Act relating to retail sale. There were also 108 appeal tribunals to which the seller had the right of appeal against the decision of a local committee. The task of dealing with larger transactions of wholesalers or manufacturers affecting whole trades or industries was entrusted by the Board of Trade to a central committee, which worked through three standing committees: the investigation of prices committee, the complaints committee and the standing committee on trusts. These standing committees in turn appointed sub-committees as required to deal with particular questions. The investigation of prices committee made investigations into the cost of production of various articles in all stages of their manufacture. Reports were published as Parliamentary papers on agricultural implements and machinery, aspirin, biscuits, boot and shoe repairs, brushes and brooms, clogs, costings in government departments, furniture, gas apparatus, matches, metal bedsteads, motor fuel, pottery, standard boot and shoe schemes, tweed cloth, worsted yarns, wool and the wool top-making trade. The complaints committee undertook the investigation of specific complaints and also investigated specific transactions brought to their notice, even when there was no formal complaint.

The committee on trusts was responsible for obtaining information as to the nature, extent and development of trusts and combines. Numerous investigations were made and Parliamentary papers dealing with the following subjects were published: dyes and dyestuffs, dyeing, finishing, bleaching and printing, electric cables, electric lamps, explosives, farriery, fish, fixed retail prices, fruit, glassware, iron and steel products, laundry prices, meat, milk, oils and fats, pipes and castings, road transport rates, salt, sewing cotton, soap, tobacco, uniform clothing, vinegar and yeast. Mention may be made further of a provision contained in the Profiteering (Amendment) Act, 1920, which authorised the Board of Trade to approve suitable schemes submitted by persons representing a substantial proportion of those

engaged in the production or distribution of goods to which the original Act was applied limiting the profit to be allowed on such manufacture or distribution. Any profit which did not exceed the amount fixed was then not to be regarded as unreasonable under the Act. Only two such schemes (relating to men's ready-made and made-to-measure clothing and to the retail sale of coal in the London area) were actually approved by the Board of Trade.

Since the lapsing of the Profiteering Act in 1921, there has been no special legislation in Great Britain against profiteering except for the continuance of restrictions on the rent which may be charged for certain classes of houses. Public feeling, however, continued to be very susceptible on the question, especially when a rise of prices occurred. Various public inquiries have been conducted into costs of production and distribution of food-stuffs and other articles of common consumption, the most important of these being (a) the inquiry of a committee appointed in 1922 under the chairmanship of Lord Linlithgow to enquire into methods and costs of selling and distributing agricultural, horticultural and dairy produce in Great Britain and the diminution of the disparity between the price received by the producer and that paid by the consumer; (b) the inquiry of the royal commission on food prices appointed in 1925 and (c) the proceedings of the food council appointed in 1925 following the report of the royal commission on food prices to watch over food prices and supplies.

*In European Countries.*—In the countries of Continental Europe public interest in prices and profits has been fully as great as in Great Britain. Periods of inflation in different countries were marked by a variety of measures designed to check speculation and prevent further rises of price. As countries got back on to a stable currency basis, or began to deflate their currency, the problem changed into one of ensuring that the benefit of stable or falling costs was reflected in quotations, and that the inevitably large profits of the inflationary period were not perpetuated. It was felt that the force of competition had been impaired, and that special action was necessary with regard to combines. Legislation motivated largely by the desire to mitigate profiteering by combines was consequently passed in several countries, including notably Germany, Czechoslovakia and Norway.

The German experiment, represented by the "decree against the abuse of economic power," which came into force in Nov. 1923, is of particular interest. The decree provided amongst other things that the German Minister of Economic Affairs may, when he considers a cartel agreement or the method of putting it into operation detrimental to the public interest, apply to the Cartel Court set up in accordance with the decree to have the agreement declared void or the particular method of carrying it out forbidden. The public interest or the common good is to be considered as detrimentally affected, particularly when supply or demand are restricted in a manner not economically justifiable; when prices are raised or kept high; or when, in the event of prices being quoted in a stable currency, extras for risks are included; or when economic freedom is unreasonably restricted by boycott in buying or selling or by the fixing of discriminating prices or conditions. Until the summer of 1925, action by the government was confined to unofficial intervention, and it was claimed that this was successful in bringing about a large number of price reductions and in preventing price increases. It was decided, however, to make a more rigorous use of the powers under the decree and suits were brought in the Cartel Court charging a number of Cartels with jeopardising the economic life of the country by the maintenance of excessive prices. Should existing powers prove inadequate, the German Govt. has announced its intention of amending the decree. (C. K. H.)

## III. PROFITEERING IN THE UNITED STATES

*United States.*—"Profiteering," as the term has been used in the United States, may be roughly defined as consciously taking and retaining profits considerably in excess of the return necessary to equilibrate demand and supply, especially when such

profits are the result of prices enhanced by the activity or policy of the recipient. Its meaning has therefore a direct relation to the current conception of a legitimate business "profit"—a point on which public opinion during the World War became peculiarly sensitive. Probably, conscious direct control of industrial processes never reached such development in the United States as during the World War. Prices were fixed and both supply and demand controlled. An unusual mass of information concerning cost, production, consumption and stocks was obtained. The chief sources of information are the cost reports of the Federal Trade Commission and data compiled from the income-tax returns.

According to income-tax returns from some 7,000 corporations their net earnings of the pre-War years 1911-3 averaged 11% on invested capital. Unfortunately, returns are not available in published material for these same corporations in 1917, but for 1918—a year of lower profits—they averaged 15%. The year 1917 was the time of maximum profits.

These income-tax returns are not conclusive. They do indicate, however, that average profits increased considerably between the pre-War period and 1918. More accurate and illuminating figures concerning particular industries were obtained by the Federal Trade Commission. A study of the costs of 37 wheat-flour companies showed that the average earned on investment was 12.6% in the fiscal year 1913-4, 17% in 1914-5, 38.4% in 1916-7 and 34% in 1917-8. That this increase in profits was not due solely to increase in business is evident from the fact that the percentage earned on sales also increased, the rate being 3.4% in 1913-4 and 6.5% in 1916-7. In 1917 there was apparently no limit to the price purchasers were willing to pay, the condition being one of panic. In the next year profits were somewhat abated by government regulation.

Twenty-two manufacturers of farm implements made at this time about 85% of the product in the United States. Their profits increased from about 9% on investment in the years just prior to the War to 16.6% in 1917 and 19.9% in 1918; and the rate of profit on sales increased several fold. There was no general shortage of farm implements and no unusual demand, for exports were cut off.

From Senate Document No. 248 (65 Cong. 2nd Session) further evidence of profiteering may be gained. It appears that oil companies circulated reports that the supply of gasoline was dangerously short, for the purpose of maintaining prices of that commodity while making "enormous" profits on fuel oil. Concerns bottling or canning vegetables, which had made future contracts, sometimes withheld portions of their output from delivery on such contracts and sold in the higher "spot" markets. In frequent cases licences were revoked by the Food Administration. The practice of such concerns in maintaining re-sale prices for jobbers contributed toward maintaining the general high level of prices and increased profits in some instances. According to the same document the steel companies in 1917, prior to government price-fixing, made abnormal profits, and a number continued to make unusually heavy profits thereafter. The United States Steel Corp., which made 5% before the War, received 25% on investment in 1917; and 10 smaller concerns made from 30% to 310% on their investments. Certain sulphur companies took advantage of the War demand for sulphur to raise their prices to such an extent as to reap net profits of approximately \$15 a ton, which meant over 200% on investment in one case. The profits of tanners increased from two to five times, as they took advantage of the enormous demand for leather and exacted very high prices. The price of hides was rapidly advanced, notwithstanding that at the same time "great supplies were withheld from the public." Upon learning of approaching price control, one of the large packers took steps "quietly and promptly" to increase the appraised value of his tanneries.

Without further evidence it may be concluded that profits in many industries increased in the earlier part of the War more than 100% above the pre-War level, and that this increase was in not a few cases due in part to profiteering as above defined.

High prices do not necessarily indicate excessive profits, but there is reason to believe that profiteering was common in cement, petroleum, lumber (notably ship timber), wool, clothing, sulphur, naval stores, rice, sugar, sand and gravel, raisins and other products, in addition to those already mentioned. In most of these cases the government reduced prices and profits through some form of control.

The U.S. Govt. attempted to deal with profiteering in three ways: (1) taxation; (2) price-fixing; (3) direct action under the Food Control Act. The first and the last methods proved largely ineffective.

By special taxes levied on profits, many thought that the spoils of the profiteers could be regained by the public. In 1916 a tax of 12½% was levied on the profits of munitions manufacturers; and a general "War profits tax" and an "excess profits tax" were imposed in 1917. In 1918 these taxes were combined. But, unfortunately, it proved so easy for most corporations to increase their investment accounts, and to pad their expenses, that the worst profiteers often showed small excess profits. Moreover, a considerable part of the tax was shifted to consumers in the shape of higher prices, as was possible during the inflation period.

Government price-fixing, while it did not prevent profiteering, did moderate the evil, notably through such substantial reductions as were made in the prices of wool, coal, sugar, flour and sulphuric acid. Unfortunately, this means was not used as vigorously and thoroughly as it would have been had there not been an ill-founded reliance upon profits taxes.

On Aug. 10 1917 the Food Control Act became law. Section 4 of this Act made it unlawful for any person to hoard or to make any unjust or unreasonable charge in transactions relating to "necessaries" (foods, feeds, fuel, fertilizers, farm implements and machinery), but imposed no penalty. Sections 6 and 7, however, provided for penalties and seizure, in case of hoarding. Section 5 authorised the licensing of dealers in necessities and the fixing of fair storage charges, commissions, profits or practices. The fixing of prices for coal and coke was authorised in section 25. It was under this Act that the Food Administration operated, and, as already indicated, its control over prices was partly effective. On June 30 1919, however, the activities of the Food Administration were suspended; and as the agitation concerning the "high cost of living" grew in volume, the Department of Justice assumed the task of enforcing the law, which remained in force while a state of war was only technically in existence. But the Attorney-General found his efforts limited by the absence of a penalty clause in section 4 and the restricted definition of "necessaries," and, at the President's request, Congress re-enacted the law in Oct. 1919, with amendments to cover these defects. According to the annual report of the Attorney-General for 1920, since Oct. 1919 sentences had been imposed on 49 sugar dealers and 20 clothing dealers. In addition, six sugar dealers and one flour dealer had been convicted of hoarding, and two coal dealers had been sentenced under the provision as to fixing reasonable prices. In all there had been over 2,000 indictments, arrests and sentences, involving chiefly the commodities just mentioned, together with meats, potatoes and meals at restaurants. The great majority could not be sustained under the law.

Meanwhile, a growing hostility to the Act was apparent. The upshot of the matter was a decision of the U.S. Supreme Court in Feb. 1921, which declared the Act unconstitutional. The reasoning of the court was that Congress alone had power to define crimes against the United States; and, therefore, because the Act was vague and indefinite, and fixed no precise standard of guilt, and because it did not inform the defendant of the nature and cause of the accusation against him, it was unconstitutional. Thus ended the anti-profitteering crusade of the Attorney-General. Meanwhile, from April 1920 prices began to decline, and with that decline came a loss of interest in the subject of profiteering.

In a sense the U.S. Govt. was to blame for much War-time profiteering. In the first place it was lax in letting contracts

and making purchases, either directly, or indirectly, by placing authority in the hands of interested persons. The "cost-plus system" invited profiteering as well as inefficiency. In the second place its combination of excess profits taxes and price regulation was unfortunate. At the same time that it fixed prices on a cost basis it spread the idea that it made little difference if excess profits were earned, as such profits would be reached by taxation. Taxation, however, proved at best to be an inadequate means of reaching profits, and early laxity in defining cost and investment made this means nugatory.

**PROFIT SHARING** (*see* 22.423).—Between 1910 and 1925 numerous schemes of profit sharing were initiated in the industrialised countries of the world. But the whole of these experiments touched no more than an insignificant proportion of the industrial and commercial concerns of the time, if we except the compulsory profit-sharing scheme introduced into the coal-mining industry of Great Britain by the terms of settlement of the great dispute of 1921. That scheme has in practice shown the almost inevitable failure of any system imposed by an outside authority upon an unwilling industry. For there is no reason to think that its effect has been other than to increase suspicion between employers and employed, to subsidise incompetence at the expense of competence, and to prevent the development of the industry in regard to technical equipment by decreasing the fund available for capital expenditure.

*Practical Difficulties.*—The latter consequence of profit sharing is, indeed, a difficulty which is almost insuperable in any instance in which the wage-earners' share in the profits is calculated upon a scale so generous as to produce an appreciable increase of their material prosperity and to promote good feeling between capital and labour. For, if the worker's share is so large as to reduce seriously the profits of the individual concern, it is clear that the latter will be less able to compete in the market owing to the decreased amount available for the technical improvement and expansion of the business. In one successful example well known to the present writer, the owner of the business is reduced almost to penury owing to the fact that his share amounting to thousands of pounds annually, is barely sufficient to provide the fresh capital required year by year for natural and healthy expansion of the business. Moreover, the limitation of his profit would render it difficult for him to offer a speculative attraction to fresh capital from outside.

In this capital difficulty is probably to be found the reason why the advocates of profit sharing are almost invariably advocates also of co-partnership. A natural development of profit sharing has been the offering of inducements to employees to invest their profits in the shares of the undertaking in which they work. But it would appear that there are very grave objections to this latter system. For from the employees' point of view it is manifestly unwise for any person, who is dependent mainly upon a weekly wage, to invest his savings in the same concern, or even in the same industry, as that from which he draws his wage. If he does so the failure of his income from the one source is only too likely to coincide with a failure of his income from the other. Clearly the small investor should place his savings in the safest possible securities. By doing so he helps industry no less than if he were to risk their loss by direct investment in industry. If he chooses government stocks, his choice tends to reduce interest rates upon such securities, thus diverting capital into industry and simultaneously lightening the tax burden upon it.

A further objection to co-partnership is to be found in the fact that it almost invariably gives rise to a demand for democratic control of the capital resources of the business in which it is practised—that is to say, for a method of control whereby voting power is based upon counting of heads and is not conferred, as in the joint-stock company system, in proportion to the amount of capital contributed by each individual voter. The complete failure of experiments in guild socialism in Great Britain is proof of the dangers of such a system of control and its tendency to cause a fatal dissipation of capital resources in attempts to maintain a high standard of living in periods of trade depression.

*Labour Banking.*—Certain developments in the United States would seem to hold out more substantial hopes than does co-partnership of rapid progress toward the economic Utopia, where every worker is a capitalist and (as a necessary consequence) every capitalist is a worker. The establishment of trade-union banks in America during the period under review is a matter of the highest interest to all who in other countries are endeavouring to increase the economic liberty of the wage-earners. If it is borne in mind that trade unionism was, in its origin, a movement with the object of giving the employed in relation to his employer a degree of liberty which the possession of capital alone can afford, it is not surprising that the great prosperity of the American worker should have led him to take steps still further to secure his position by using trade-union capital in banking. The development would seem to be a natural one, though in other countries it will probably take a somewhat different form, to which reference will be made later. The chief danger would seem to lie in the control of large amounts of money being placed in the hands of inexperienced persons. But if serious incompetence or dishonesty is not encountered in the early stages of the expansion of Labour banking, there seems to be good reason to hope for a very great and beneficent growth of the system in the future, accompanied by a most valuable economic education of the workers concerned.

In Great Britain, however, it may well be that the difficulty in regard to capital should be dealt with by extension of the existing banking system rather than in direct control of credit by trade-union banks on the American plan. If a part of the increased earnings of labour, arising from profit sharing, can be attracted into the banks in the form of deposits, those institutions will be in a position to make correspondingly increased advances to industry and thus to provide for larger turnover without an increase in the subscribed capital of the concerns in question. By this means the savings of the small investor would be guarded from the danger of his inexperience, and would be kept available for withdrawal at comparatively short notice without capital depreciation—two conditions which are essential if the habit of investment is to spread rapidly among the manual workers.

At present the floating credit available for industry is mainly provided by the undrawn balances of the dividends of the *rentier* paid half-yearly into the banks. The additional resources placed in the hands of the latter by the creation of a numerous class of persons, mainly dependent upon a weekly wage but having also smaller or larger amounts on deposit, would tend to reduce the price of credit and to that extent to add to the real value of wages.

An essential condition of material prosperity is political stability; and political stability under a democratic constitution is only assured when the majority of the people is composed of capitalists. Profit sharing would appear to be the first step toward that condition of affairs, though experience has shown that many men will neglect to make any provision for the future, even when a profit-sharing scheme in being gives them twice the normal wage rate over a considerable period. But the duty of the employer would seem to demand that he should at least make it possible for his workers to become capitalists, while preventing them from placing the control of their capital at the mercy of a popular vote. So far as the prosperity of industry is concerned, it is of small importance who owns capital. The important matter is the question of who controls it.

*General Principles.*—The following principles, based on experience, are considered essential to the successful working of any scheme applied to a business which is not (like a gas undertaking) of the nature of a monopoly:—

(1) The motive for the introduction of a given scheme has a profound influence on its success or failure. If the intention of the employer is simply to increase his profit, failure is to be expected, since the scheme is in that case no more than one of collective piece-work, to which the term "profit sharing" cannot properly be applied. But if the employer initiates a scheme mainly with the intention of adding to the material prosperity of the employed, without aiming at direct benefit to himself, success may be anticipated.

(2) It follows that a high degree of mutual confidence must already exist between employer and employed before a profit-sharing scheme can be introduced with a fair prospect of success.

(3) The scheme must be drawn up in such a way as to insure that, in time of trade prosperity, the addition to basic wages shall be substantial. The profit bonus should be paid, in part at least, at frequent intervals rather than annually or half-yearly.

(4) The employer must be prepared to meet instantly demands from the workers for improved machinery and organisation, and must give to them as much information as possible regarding the position of the business from month to month. (A. Ho.)

**PROGRESSIVE PARTY** (see 27.735).—The title Progressive party has been taken twice in the United States by third-party movements, first in the presidential campaign of 1912 and again in 1924. Both movements represented revolts against the conservative leadership of the Republican party; both were led by prominent figures formerly of that party; and both sought to effect an alliance of the agrarian elements of the northwest with labour elements in the industrial sections of the country, as against the dominant financial and industrial interests of the north-central, Atlantic and New England strongholds of the party.

The Progressive party movement of 1912 was heralded by the "insurgent" outbreak among Republican members of Congress in 1910, which succeeded in reducing considerably the powers of the Speaker of the House of Representatives. Opposition to the administration of Taft, then President, took concrete form early in 1911 when the National Progressive Republican League was organised under the leadership of Senator R. M. La Follette of Wisconsin. During the following year, however, Theodore Roosevelt placed himself at the head of the Progressive movement. Alleging unfair tactics on the part of the "Old Guard," his followers left the Republican national convention held in Chicago (June 1912), and Roosevelt was nominated for the presidency by a Progressive national convention also held in Chicago early in August of the same year. As a result the Republican party was hopelessly split, Roosevelt receiving a popular vote exceeding that of Taft by more than 600,000. Woodrow Wilson, Democratic candidate, was successful, obtaining the electoral vote of all except eight states. Although defeated in this national campaign, the Progressive movement was influential before and after 1912 on the course of affairs at Washington, and it was directly instrumental in writing upon the statute books many states laws regulating corporations and labour, and establishing the initiative, referendum, recall, corrupt practices acts and direct primaries.

In 1916 harmony was restored in the Republican party, Roosevelt returning to his former allegiance. During the World War partisanship was in abeyance, but upon its termination the old rift soon reappeared. The administration of Harding encountered increasing agrarian dissatisfaction, and this was true also of the first portion of the Coolidge administration. In 1924 the contingent from Wisconsin and neighbouring states, after sitting in the Republican convention at Cleveland, held a Conference for Progressive political action made up chiefly of farmer, labour and socialist delegates. Senator R. M. La Follette was nominated for the presidency, and later Senator B. K. Wheeler of Montana for the vice-presidency. The platform promised a complete house cleaning in the executive departments, public control of national resources, public ownership of railways, tariff and tax reduction, agricultural relief, labour legislation, public referendums on peace and war, direct nomination and election of the president, extension of the initiative and referendum to the Federal Govt., election of Federal judges and a constitutional amendment providing that Congress may by re-enacting a statute make it effective over a judicial veto. Republican strategy during the campaign of 1924 consisted largely in denouncing the alleged ultra-radicalism of the La Follette platform, particularly the planks concerning the judiciary, meanwhile for the most part ignoring Democratic attacks. This strategy was completely successful, Coolidge receiving an enormous majority both of the popular vote and in the electoral college. La Follette carried only his own state, but polled almost a sixth of the popular vote. (See UNITED STATES: History.) (R. C. B.)

**PROHIBITION.**—As a legal term, prohibition is discussed in an earlier article (see 22.427) and as a phase of the temperance movement in connection with intoxicating liquor, and as a legislative method, especially under State and local option laws in the United States it is treated historically to 1910 in the article TEMPERANCE (see 26.578). The closely related legislation since 1910, regulating the liquor traffic in Great Britain and other countries, including the United States, where it furnishes the necessary background for the understanding and interpretation of prohibition, is reviewed in the article LIQUOR LAWS (q.v.) (see also 16.759).

With its adoption on a national scale by constitutional amendment, ratified Jan. 16 1919, by the necessary number of States, and in force over the entire territory of the United States one year thereafter, Jan. 16 1920, prohibition became by common consent the greatest social experiment of modern times.

*The 18th Amendment.*—The 18th Amendment to the Constitution of the United States reads as follows:—

Section 1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

Section 2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

Section 3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures

## Votes in State Legislatures on Ratification of Eighteenth Amendment

|                     | Senate   |          | House    |            |
|---------------------|----------|----------|----------|------------|
|                     | Date     | Vote     | Date     | Vote       |
| (1) Mississippi     | 1-8-18   | 28 to 5  | 1-8-18   | 93 to 3    |
| (2) Virginia        | 1-10-18  | 30 to 8  | 1-11-18  | 94 to 13   |
| (3) Kentucky        | 1-14-18  | 28 to 6  | 1-14-18  | 66 to 10   |
| (4) South Carolina  | 1-18-18  | 28 to 6  | 1-28-18  | 66 to 29   |
| (5) North Dakota    | 1-25-18  | 43 to 2  | 1-25-18  | 96 to 10   |
| (6) Maryland        | 2-13-18  | 18 to 7  | 2-8-18   | 58 to 36   |
| (7) Montana         | 2-19-18  | 35 to 2  | 2-18-18  | 77 to 8    |
| (8) Texas           | 2-28-18  | 15 to 7  | 3-4-18   | 72 to 30   |
| (9) Delaware        | 3-18-18  | 13 to 3  | 3-14-18  | 27 to 6    |
| (10) South Dakota   | 3-19-18  | 43 to 0  | 3-20-18  | 86 to 0    |
| (11) Massachusetts  | 4-2-18   | 27 to 12 | 3-26-18  | 145 to 91  |
| (12) Arizona        | 5-23-18  | 17 to 0  | 5-24-18  | 29 to 3    |
| (13) Georgia        | 6-26-18  | 34 to 2  | 6-25-18  | 129 to 24  |
| (14) Louisiana      | 7-6-18   | 21 to 20 | 8-8-18   | 69 to 41   |
| (15) Florida        | 11-27-18 | 25 to 2  | 11-27-18 | 61 to 3    |
| (16) Michigan       | 11-2-19  | 30 to 0  | 1-2-19   | 88 to 3    |
| (17) Ohio           | 1-7-19   | 20 to 12 | 1-7-19   | 85 to 30   |
| (18) Oklahoma       | 1-7-19   | 43 to 0  | 1-7-19   | 90 to 8    |
| (19) Maine          | 1-8-19   | 29 to 0  | 1-8-19   | 122 to 20  |
| (20) Idaho          | 1-8-19   | 38 to 0  | 1-7-19   | 62 to 0    |
| (21) West Virginia  | 1-9-19   | 27 to 0  | 1-9-19   | 78 to 3    |
| (22) Washington     | 1-13-19  | 42 to 0  | 1-13-19  | 93 to 0    |
| (23) Tennessee      | 1-9-19   | 28 to 2  | 1-13-19  | 82 to 2    |
| (24) California     | 1-10-19  | 24 to 15 | 1-13-19  | 48 to 28   |
| (25) Indiana        | 1-13-19  | 41 to 6  | 1-14-19  | 87 to 11   |
| (26) Illinois       | 1-8-19   | 30 to 15 | 1-14-19  | 84 to 66   |
| (27) Arkansas       | 1-14-19  | 34 to 0  | 1-13-19  | 93 to 2    |
| (28) North Carolina | 1-10-19  | 49 to 0  | 1-14-19  | 93 to 10   |
| (29) Alabama        | 1-14-19  | 23 to 11 | 1-14-19  | 64 to 34   |
| (30) Kansas         | 1-14-19  | 39 to 0  | 1-14-19  | 121 to 0   |
| (31) Oregon         | 1-15-19  | 30 to 0  | 1-14-19  | 53 to 3    |
| (32) Iowa           | 1-15-19  | 42 to 7  | 1-15-19  | 86 to 13   |
| (33) Utah           | 1-15-19  | 16 to 0  | 1-14-19  | 43 to 0    |
| (34) Colorado       | 1-15-19  | 34 to 1  | 1-15-19  | 63 to 2    |
| (35) New Hampshire  | 1-15-19  | 19 to 4  | 1-15-19  | 221 to 131 |
| (36) Nebraska       | 1-13-19  | 31 to 1  | 1-16-19  | 98 to 0    |
| (37) Missouri       | 1-16-19  | 22 to 10 | 1-16-19  | 104 to 36  |
| (38) Wyoming        | 1-16-19  | 26 to 0  | 1-16-19  | 52 to 0    |
| (39) Wisconsin      | 1-16-19  | 19 to 11 | 1-17-19  | 58 to 35   |
| (40) Minnesota      | 1-16-19  | 48 to 11 | 1-17-19  | 92 to 36   |
| (41) New Mexico     | 1-20-19  | 12 to 4  | 1-16-19  | 45 to 1    |
| (42) Nevada         | 1-21-19  | 14 to 1  | 1-20-19  | 33 to 3    |
| (43) Vermont        | 1-16-19  | 26 to 3  | 1-29-19  | 155 to 58  |
| (44) New York       | 1-29-19  | 27 to 24 | 1-23-19  | 81 to 66   |
| (45) Pennsylvania   | 2-25-19  | 29 to 16 | 2-4-19   | 110 to 93  |
| (46) New Jersey     | 3-9-22   | 12 to 4  | 3-7-22   | 33 to 24   |

1 Repassed in Lower House to correct error Jan. 23.

Total Senate Vote 1,309 for, to 240 against, 84% dry.  
Total House Vote 3,775 for, to 1,025 against, 78½% dry.

of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

On Jan. 29 1919 the Secretary of State issued a proclamation to the effect that on Jan. 16 of that year the ratification of the 36th State, making the necessary three-fourths of all the States, had been filed. Later it was ratified by 10 additional states.

In six States (South Dakota, Idaho, Washington, Kansas, Utah and Wyoming) the vote in favour of the amendment was unanimous in both Houses. In only two States (Connecticut and Rhode Island) the amendment has not been ratified. When the matter was twice before the Legislature in Rhode Island the Senate voted 20 to 18 in 1918 and 25 to 12 in 1919 to postpone indefinitely the consideration of the amendment. In Connecticut the Senate voted 14 for to 20 against ratification and the House 153 for to 96 against, thus making a total vote in both States of 197 for to 161 against the amendment.

Dr. Ernest H. Cherrington in "World Wide Progress toward Prohibition Legislation" (*Annals*, Amer. Acad. of Pol. and Social Science, 109.223, Sept. 1923) says: "No amendment to the Federal Constitution ever received as strong official sanction by the States as the 18th Amendment. The original Constitution was adopted in the 13 original States by a majority of about two to one. The aggregate vote in the State Senate and State Houses of Representatives for the ratification of the 18th Amendment shows a majority of more than four to one." The Bill of Rights (the first 10 amendments) and the 11th Amendment were ratified by 10 out of 13 States. The 12th Amendment was not ratified by four States, the 13th Amendment by five States, the 14th Amendment by four States, the 15th and 16th amendments by six States, the 17th and 19th amendments by twelve States. But the 18th Amendment was ratified by 46 out of 48 States. Forty-seven States have enacted laws to help carry into effect the provisions of the 18th Amendment; and in one State (Nevada) such a law was held unconstitutional on technical grounds as to form. Only one (New York) has repealed or weakened such a law.

Dr. Fabian Franklin, the author of "*What Prohibition Has Done to America*" (N.Y., 1922) says in "What's Wrong with the 18th Amendment?" (*Annals*, 109.48, Sept. 1923) in denouncing what he terms a legislative atrocity: "Everybody knows—everybody knew when the 18th Amendment was adopted that in every one of our great cities, so far from there being an overwhelming majority in favour of prohibition, there was a decisive majority against it. Everybody knew that the like was true in many of the smaller cities. Everybody knew that there were many whole States, great and small, in which prohibition could not command a majority of the people, and that there were a number of others in which the vote would be nearly evenly divided. In the face of such a situation it is idle to talk of the question whether or not a majority of the whole people of the United States favoured or did not favour the 18th Amendment. The only question is whether it was an outrage, perpetrated by a majority upon a minority or an outrage perpetrated by a minority upon a majority."

It may be that the votes of the people are not correctly reflected in the votes of their representatives in Congress or in the State Legislatures, or, as Dr. N. M. Butler has often put it, that neither the representatives nor the voters have the courage to vote as they drink. It is difficult, however, to reconcile Dr. Franklin's view with the records of the votes in the Congress that proposed the 18th Amendment, elected before the United States entered the World War and therefore not influenced by the absence in military service of men opposed to prohibition as has been claimed, and including a Senate elected for the first time by popular vote under the provisions of the 17th Amendment, or with the votes for ratification or with every subsequent vote in Congress on the Volstead Act and its amendments providing for enforcement of prohibition. Prof. Felix Frankfurter of the Harvard Law School has said (*Annals*, 109.193): "Prohibition was written into the Constitution with as much deliberation as attended the enactment of any amendment to the Constitu-

tion. Prohibition was the culmination of 50 years of continuous effort; nor did the movement lack alert, persistent and powerful opposition."

*State Prohibition.*—State-wide prohibition was the law in 33 States, more than two-thirds of all the States at the time the 18th Amendment went into effect. It had been written into the constitution of 18 of them, and in most cases it had been adopted or ratified in a referendum election. It had been adopted in the territories, in 1917 in Alaska and Porto Rico (ratified by the voters), and in the District of Columbia by Congressional enactment and in 1919 in Hawaii. At the time the amendment went into effect (Jan. 1920), 90% of the townships and rural precincts, 85% of the counties and over 75% of the villages of the United States were under prohibition by State legislation. Two-thirds of the members of the United States Senate and more than two-thirds of the House of Representatives came from States or districts having State prohibition. Local option and State prohibition had put 68.3% of the population and 95.4% of the land area of the United States under prohibition and the amendment and subsequent legislation pursuant thereto really affected directly and radically only 31.7% of the population and 4.6% of the land area of the United States.

#### NATIONAL PROHIBITION INTRODUCED

*Influence Behind National Prohibition.*—Nation-wide prohibition came with surprising suddenness. It was greatly accelerated by the World War. It was not caused, however, by the War. It had a long natural history. For more than a century temperance reform had been a growing moral issue. Its legislative history dated back nearly 70 years to the first State prohibition law in Maine in 1851. New scientific knowledge in the pre-War years since the beginning of this century had emphasised the menace to health and efficiency and the frightful cost and waste inherent in the consumption of alcoholic beverages in even moderate quantities relatively to earlier standards of moderation and excess. New industrial economics did not seem to find any place for alcoholic beverages in working out the problems of the expansion and large-scale production of American industry, trade and commerce. New educational forces caused the saloon to be regarded with increasing disfavour as a social institution, the so-called poor man's club, and a growing irritation concerning the saloon as a political menace was manifest.

Long before the United States entered the World War the conviction was growing that social and industrial efficiency, and even national prosperity, could not be achieved at any less cost than whatever sacrifices might be involved in national prohibition. The legislation by Congress for several years before War-time prohibition (see LIQUOR LAWS) shows that every effort was made to supplement and strengthen State and local prohibition, and judicial decisions illustrate the same tendency in order that national prohibition should not be adopted except as a last resort and in obedience to a compelling necessity. As soon as the United States entered the World War two economic factors—the fear of the loss of man-power on account of intemperance, and the loss of food used in the manufacture of alcohol, but needed to supply the army of the United States and its Allies—served to turn the scales in favour of national prohibition as a war measure. The satisfactory experience with war-time prohibition in its initial stages served to crystallise an overwhelming national sentiment in favour of permanent constitutional prohibition.

*After Ratification; Provisions for Enforcement.*—The Draft Law of May 18 1917, the Food Control Act of Aug. 10 1917, and an Act to Promote the Efficiency of the United States Navy, approved Oct. 6 1917, gave the President prohibitory powers to be exercised for war purposes. The so-called War Prohibition Act was not enacted until Nov. 21 1918, 10 days after the signing of the Armistice, as an amendment to the Agricultural Appropriation bill. It provided that after June 30 1919, until the conclusion of the War and of demobilisation, the date of which was to be determined and proclaimed by the

President, it was unlawful to sell for beverage purposes any distilled spirits from bond except for export. It also provided that after May 1 1919 no grain, cereals, fruit or other food products should be used in the manufacture or production of beer, wine or other intoxicating malt or vinous liquor for beverage purposes, and after June 30 1919, no beer, wine or other intoxicating malt or vinous liquor should be sold for beverage purposes except for export until the conclusion of the War and of demobilisation. Importation of distilled, malt, vinous, or other intoxicating liquors was prohibited. The War Prohibition Act continued in force until national prohibition under the 18th Amendment and legislation pursuant thereto became effective on Jan. 16 1920, one year after the ratification of the amendment. The President had not prior to that time proclaimed the conclusion of demobilisation.

*The Volstead Act.*—The national Prohibition Act, popularly known as the Volstead Act and sometimes referred to by its longer title, the Prohibition Enforcement Law, passed the House of Representatives July 22 1919 by a vote of 287 to 100, three members voting "present." It passed the Senate with slight amendments and without a roll-call on Sept. 4 1919. The conference report to the Senate and House was adopted in the Senate Oct. 8 without roll-call or record vote, and in the House by a vote of 321 to 70 on Oct. 10. The measure then went to the President, who vetoed it and returned it with his veto message Oct. 27. The House on the same day, by a vote of 176 to 55 passed the bill over the President's veto, and the Senate, by vote of 65 to 20 on Oct. 28 1919, did likewise, and on that day the measure became law applicable by its terms immediately for the enforcement of the War Prohibition Act, and "when the 18th Amendment to the Constitution goes into effect," intended to carry out the purposes of that amendment. The Act is notable for its definitions, including the fixing of  $\frac{1}{2}$  of 1% of alcohol by volume as the test of intoxicating liquor, and the delegation of power to the Commissioner of Internal Revenue to make regulations, with the approval of the Secretary of the Treasury, having the force of law, for carrying out the provisions of the Act.

*Validity Tested.*—The constitutional validity of the adoption of the 18th Amendment and of the Volstead Act and its definition of intoxicating liquor was tested in the U.S. Supreme Court and promptly sustained in the leading cases of *Hawke v. Smith*, decided June 1 1920 (253 U.S. 221), and *Rhode Island v. Palmer*, decided June 7 1920 (253 U.S. 350), in which the Court disposed of seven cases pending. The Court had previously sustained the War Prohibition Act and the  $\frac{1}{2}$  of 1% limit which it specified. The liquor interests hoped that greater latitude might be given through a strict construction of the first section of the 18th Amendment, which did not specify the content or define intoxicating liquor. It was argued that the amendment therefore did warrant legislation forbidding the sale and manufacture of liquor which was in fact non-intoxicating, whether it contained more or less than  $\frac{1}{2}$  of 1% of alcohol. The Court, however, without stating or discussing this contention, cited the War prohibition cases in support of the conclusion that while "recognising that there are limits beyond which Congress cannot go in treating beverages as within its power of enforcement, we think those limits are not transcended by the provision of the Volstead Act."

#### THE WORKING OF THE VOLSTEAD ACT

*Enforcement.*—The Volstead Act provides for drastic enforcement. The difficulties of enforcement were foreseen especially by those who knew the history of State prohibition laws and the experience in some cases of a half-century in the struggle to enforce them. It was sought therefore to give the Government ample powers, through the Commissioner of Internal Revenue of the Treasury Dept., to detect and suppress all manner of violations. The regulations under the Act which apply to physicians' prescriptions and the procuring of wine for sacramental purposes are also drastic, and similar provisions were made more so in the Supplemental Prohibition Enforcement

Act of Nov. 23 1921 (C. 134 Stat. 42), better known as the Anti-Beer Act because it provided that beer with a greater content than  $\frac{1}{2}$  of 1% could not be prescribed for medicinal purposes, that only spirituous or vinous liquor, the latter containing not more than 24% of alcohol by volume could be prescribed, and that not more than  $\frac{1}{4}$  gal. of vinous liquor nor any quantity of liquor containing more than  $\frac{1}{2}$  pint of alcohol could be prescribed for the use of any person within 10 days, and that no physician may have more than 100 permits within 90 days unless to meet emergency needs, to be demonstrated to the satisfaction of the commissioner who issues such permits. This may seem to be an unnecessary and unwarranted interference with medical science, but the provision indicated that no power would be refused that the administrative authorities might find necessary to make the enforcement of national prohibition effective.

Other provisions of the Supplemental Act give the enforcing authorities control over importations for non-beverage purposes; provide that both the Supplemental and the National Prohibition Acts apply not only to the United States but to all territory subject to its jurisdiction, that liquor laws in force when the National Prohibition Act was adopted and not in conflict therewith, shall continue in force, and also made it unlawful for any U.S. officer to search any private dwelling without a search warrant.

With respect to the latter point, which seemed to emphasise a constitutional limitation upon the powers of the enforcing authorities, the Supreme Court in 1925 (*Carroll v. U.S.*, 69 L. ed. 347) upheld the search of an automobile or vehicle of transportation without a warrant where the search was not malicious or without probable cause, and the same Court sustained, as within the police powers of the States, a Georgia statute which prohibited the possession of liquor which had been legally acquired—that is, before prohibition (*Samuels v. McCurdy*, 69 L. ed. 371). It is proposed in an administration bill sent to Congress in 1926 to strengthen the seizure and search provisions of the prohibition law. The Dept. of Justice has approved the wider use of the padlock and abatement of nuisance provisions of section 22, and other sections of the National Prohibition Act. These are drastic but the only effective means of securing enforcement in the worst wet areas where organised opposition is powerfully entrenched. The methods employed in the enforcement of law of this character necessarily involve, as in the case of tariff and revenue laws and other laws where there is a strong motive to defeat their purpose, many nice questions of constitutional guarantees of liberty and protection of innocent persons. The Supreme Court, however, has in all its decisions thus far, with the possible exception of one case in which it held section 35 of the national prohibition law invalid because of the denial of a trial by jury in the collection of a tax which was a penalty for a crime, gone very far to sustain the Government and Congress in the exercise of every power necessary to carry out a lawful purpose.

*The Concurrent Power.*—The theory of enforcement of the 18th Amendment and laws pursuant thereto is that of joint action of the Federal and State Govts. under the "concurrent power" granted in the second section of the amendment which declares "The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation." The question of the meaning of "concurrent power" was settled by the Supreme Court in *Hawke v. Smith*, which held that this provision of the amendment was within the amending power, was a part of the constitution and "must be respected and given effect the same as other provisions of that instrument," was "operative throughout the entire territorial limits of the United States" and "of its own force invalidates every legislative act, whether by Congress, by a state Legislature, or by a territorial assembly, which authorises or sanctions what the section forbids." The Court further held that "concurrent power" does not enable Congress or the several States to defeat or thwart prohibition, but only to enforce it by appropriate legislation, and that these words do not mean joint

power, or require that legislation thereunder by Congress to be effective shall be approved or sanctioned by the several States or any of them. Neither do the words "concurrent power" mean that the power to enforce is divided between Congress and the several States along the lines which separate or distinguish foreign and interstate commerce from intrastate affairs. The power confided by the second section of the amendment to Congress, while not exclusive, is territorially co-extensive with the prohibition of the first section, embraces manufacture and other intrastate transactions as well as importation, exportation and interstate traffic, and is in no wise dependent on or affected by any action or inaction on the part of the several States or any of them.

*Administrative Difficulties.*—The obstacles to efficient enforcement have not come from the Courts but rather from the administrative difficulties due to the lack of enforcement machinery of the Government and in part to the location of enforcement machinery in several departments of the Government. It was a mistake at the outset not to have put the appointment of all enforcement officers under Civil Service rules and this will doubtless soon follow the recent reorganisation of the prohibition unit in the Treasury Dept., which is responsible for the gathering of evidence, while the Dept. of Justice is responsible for trying cases which arise under the law. The judicial conference of the senior circuit judges, with the concurrence of Chief Justice Taft recommended in Nov. 1924, that the prohibition unit be transferred bodily to the Dept. of Justice and that all the appropriations for such enforcement should be expended under the Attorney-General. The judges thought that thus "the attempted prosecution of trivial, futile and unimportant cases which now crowd the dockets can be avoided, and only those cases taken up and pressed which will really deter the principal offenders, and in the preparation of which district attorneys will have a personal responsibility."

It is generally thought that the experience and technique of the Treasury Dept. in the enforcement of liquor revenue laws are essential for the detection of violations and must be more closely co-ordinated with prosecutions by the Dept. of Justice. Both in theory and practice, in the nature of the proceedings in Federal Courts requiring jury trial, and in the absence of Federal police courts to dispose of petty cases, "the resources of the Federal Govt. in administration and judicial machinery are sufficient to cope successfully only with what may be called the 'wholesale' aspects of the enforcement problem—smuggling (see BOOTLEGGING AND SMUGGLING), including report of arrests, seizures, etc., made by Federal prohibition officers, the withdrawals of bonded liquors, the diversion and conversion of industrial alcohol to beverage uses, interstate transportation of liquors and the major conspiracies to violate the law, some of which are of giant proportions." For the rest, State and local machinery must be relied upon for the purpose of enforcing the law (see F. Ernest Johnson, "Prohibition Enforcement," *American Year Book*, 1925, pp. 248–52).

*Present and Proposed Reorganisation of the Prohibition Unit.*—On April 1925 the Customs and coast-guard services and the prohibition unit (previously under the Commissioner of Internal Revenue) were grouped together and put under Gen. Lincoln C. Andrews, U.S.A. retired, recently appointed for the purpose an assistant secretary of the Treasury. Decentralisation is of the essence of this plan by which the country was divided into 22 districts, corresponding to existing judicial districts, with two additional for Hawaii and Porto Rico, each under an administrator who is made fully responsible and given ample authority for the enforcement of the law in his district. To bring the whole problem still more directly under the eye of the Secretary of the Treasury and the President, the recommendation of the Secretary of the Treasury to Congress is to create a bureau of Customs and a bureau of prohibition, each with a commissioner directly responsible to the secretary, and to take from the over-worked commissioner of Internal Revenue all activity in regard to prohibition enforcement and put it up to the Secretary of the Treasury and such officials as he may designate.

*Treaties to Check Liquor Smuggling.*—A series of treaties embodying the so-called 12-mile limit or one-hour run for boarding and examination of private vessels under foreign flags have been negotiated, beginning with Great Britain in Jan. 1924, ratified and proclaimed May 22 1924, and including the principal countries of Europe, and Canada, Cuba, Panama and Mexico among near neighbours. These treaties uphold the principle that three marine miles constitute the proper limits of territorial waters but permit the boarding of private vessels outside territorial waters but not at a greater distance than one hour from the coast. As an offset for this privilege foreign vessels are permitted to carry liquors in territorial waters "when such liquors are listed as sea stores or cargo destined for a port foreign to the United States" and are "kept under seal continuously while the vessel on which they are carried remains within said territorial waters."<sup>1</sup>

*Civil and Criminal Prosecutions.*—An astonishing amount of prohibition litigation is reported by the Dept. of Justice as having been handled by the Federal courts. In an official report issued Sept. 16 1924, covering the 4½ years that prohibition had been in effect from Jan. 16 1920 to June 30 1924, it is stated that there were during this period 195,050 criminal prohibition cases filed; 15,019 trials by jury in prohibition cases; 152,635 persons convicted for violating the national Prohibition Act; and 6,235 persons acquitted. Fines assessed amounted to \$20,381,136, of which amount \$7,041,564 was assessed during the year ended June 30 1924.

The criminal prosecutions under the National Prohibition Act and other data in connection therewith are given in the table below, and a summary of the number of arrests, seizures, etc., also for the period 1920–5, will be found in a table in the article BOOTLEGGING AND SMUGGLING (*q.v.*). Statistics concerning intoxicating liquors compiled by the Commissioner of Internal Revenue and published annually by the Treasury Dept., prohibition unit, usually in the month of April, should be consulted for further details and verification of these figures.

Mrs. M. W. Willebrandt, Assistant Attorney-General, in her report for the fiscal year ending June 30 1925, gives the following summary of the civil suits to which the United States was a party during the fiscal year and in connection with the Prohibition Act:—

|                                                                                                          |           |
|----------------------------------------------------------------------------------------------------------|-----------|
| Civil cases pending June 30 1924                                                                         | 5,680     |
| Civil cases terminated                                                                                   | 5,927     |
| Judgments against U.S.                                                                                   | 444       |
| Civil cases commenced during fiscal year                                                                 | 7,271     |
| Judgments for U.S.                                                                                       | 4,471     |
| Dismissed after payment or compromise                                                                    | 71        |
| Dismissed for other reasons                                                                              | 941       |
| Appealed to Circuit Court of Appeals                                                                     | 55        |
| Appealed to Supreme Court                                                                                | 2         |
| Trials by jury                                                                                           | 233       |
| Civil cases pending June 30 1925                                                                         | 7,024     |
| Amount of judgments obtained                                                                             | \$303,715 |
| Amount realised from such judgments                                                                      | \$185,548 |
| Amount realised from old judgments, settlements by compromise, etc.                                      | \$ 63,570 |
| Amount paid through United States Attorney, on demand, in cases where no actual civil suit was commenced | \$ 37,976 |

Penalties are reported as rapidly growing much stricter and the average jail sentence longer. During the time prohibition has been in effect in Federal courts, the Dept. of Justice report of 1924 stated that 82% of all the persons against whom complaints have been filed for violations have been convicted.

Mrs. Willebrandt, in her report to the Attorney-General for the year ending June 30 1925, is quoted (*World Almanac*, 1926, p. 178):—

It is quite apparent that the Federal judicial machinery has reached its peak in the disposition of cases. If the dockets are to be cleared and the number of pending cases kept at a reasonable figure, it is necessary that additional assistance, both judicial and prosecuting,

<sup>1</sup> For recent treaties of this character negotiated, see article by C. G. Fenwick (*Amer. Year Book*, 1925, p. 43), and for court decisions regarding claims under these treaties, see article by Chas. E. Hill (*ibid.*, p. 226).

## Criminal Prosecutions under the National Prohibition Act in Federal Courts

|                               | 1920      | 1921        | 1922        | 1923        | 1924        | 1925        |

| Collected without prosecution |           |             | \$847       | \$144,529   | \$84,053    | \$65,430    |
| Sentences imposed             | No record | No record   | 1,552 years | 2,241 years | 3,187 years | 4,569 years |

be given at the points where clogged dockets and a continuous inrush of cases make the speedy administration of justice practically impossible. United States attorneys throughout the country are handicapped by insufficient legal and clerical assistance, and in many districts are prevented from promptly disposing of criminal prosecutions by the inability of the courts to give sufficient time to the holding of criminal sessions.

The small penalties provided by the National Prohibition Act are increasingly deplored by U.S. attorneys, judges and other officials charged with duties and conversant with conditions relating to law enforcement. They are disproportionate to the penalties imposed for violation of other Federal laws, and at least for illegal manufacture, sale, transportation and importation, acts receiving particular constitutional condemnation, the penalties should be much higher. Additional judges and increased office help for U.S. attorneys are absolutely necessary to bring about a more speedy disposition of criminal cases in the congested districts.

This judgment is affirmed by many district attorneys and in frequent reports by the present District Attorney for the southern district of New York and his predecessors. This is one of the most difficult districts for enforcement because of the volume of business and the absence of a State enforcement law.

*The Cost of Prohibition.*—Much controversy has raged over the cost of enforcement. The Federal budget for 1925-6 carried a total of \$21,940,529 for prohibition enforcement, which included \$12,634,000 for the coast guard. Excluding the cost to the States, which in most cases is more than offset by fines collected, which indeed in some instances are a source of considerable revenue to the States, and excluding the expenditure of the Dept. of Justice on account of the Volstead Act, which, of course, cannot be segregated in the general appropriation for the Dept. of Justice, it is estimated that the total expenditure on account of the prohibition law by the Federal Govt. for the fiscal year 1925-6 will be a little more than \$19,300,000. In addition, there will be some capital expenditure for the coast guard, partly attributable to the prohibition enforcement service it renders. The construction of two new coast guard cutters at a cost of \$9,000,000 is one such item. The total amount realised on fines in the previous fiscal year was nearly \$5,000,000 and the total value of property seized was over \$10,000,000. These figures will not be less, and may be considerably more for the current fiscal year. The most conservative estimate of the direct economic benefits of prohibition in dollars and cents, while impossible to estimate with even approximate scientific accuracy on the basis of present records, are nevertheless much greater than the net cost of present enforcement plus the loss of revenue from the Federal taxation of the liquor traffic at its highest level in pre-prohibition days. There is no question but that the Federal taxpayer could afford to increase greatly the expenditure for enforcement of prohibition without having to incur any tax burden on that account.

### ECONOMIC AND SOCIAL RESULTS

The only positive economic and social result of prohibition upon which there is substantial agreement among those who oppose and those who favour it is the passing of the saloon. This has been an undisputed gain everywhere, economically, socially and politically. There is no demand for its re-establishment. The low-priced automobile, a home and the expansion of the family budget to include many things that formerly were

luxuries, have become in a few years under prohibition and are becoming on an accelerated scale an acceptable substitute for the poor man's club, now recognised as never before as a wasteful and unnecessary adjunct in the domestic economy of the average citizen of moderate means.

The widespread and growing diffusion of ownership of property and the investment of small increments of surplus earnings in good income-producing shares in the working capital of the country have been made possible, to a considerable degree, by prohibition and the consequent removal of the saloon as a temptation and organised agency of exploitation of an appetite and of a human weakness. However great—and it is certainly astonishingly large—has become the organised business of the bootlegger and the illicit liquor traffic it has not and cannot in the very nature of things as an outlaw industry exploit the great mass of people of small means by the direct and effective appeal the saloon was able to make. This is an economic result worthy of consideration and in a measure explains the real opposition to the so-called liberalisation of the prohibition law and the proposal to permit light wines and beer. There is a doubt in the minds of most persons of experience in the administration of liquor laws, not confined by any means to fanatical prohibitionists, whether this can be done without a return of the saloon or some analogous institution which would render as great a social and economic disservice to the community.

Experience in Quebec and in other parts of Canada under state control seems to support this view. From a financial and administrative point of view after four years of operation, the Quebec liquor law was declared an unqualified success by the head of the liquor commission of the province, but there is ample testimony to the fact that the government beer store and the café, authorised to sell beer for consumption on the premises, although no bars are allowed, have brought back in fact most of the disadvantages without some of the obvious advantages of the former saloons. The effect, moreover, upon the illicit liquor traffic and the consumption of hard liquor has not been all that was expected.

Many attempts have been made to appraise the economic and social results as distinguished from the moral and political phases of national prohibition. The records do not exist for a sufficiently long period, nor do they give comparable data for a sufficiently wide area to measure objectively, statistically and by scientific methods enough tests such as arrests for drunkenness, alcoholic psychosis, deaths from alcoholic diseases, etc., in order to arrive at positive conclusions. Most of the statistics available cover only five years at most under national prohibition during a period when the economic life of the country was operating under exceptional conditions of post-War adjustments to excessive economic disturbances and upheaval. This period is altogether too short to determine trends, even if under normal conditions, in so complicated a problem where it is difficult at best to isolate and measure many of the controlling factors.

*The Federal Council of Churches Report.*—The most comprehensive and best attempt from the point of view of scientific method to evaluate economic and social results is that of the Federal Council of Churches Report (*Research Bulletin No. 5, "The Prohibition Situation"*). For that reason and because its

conclusions were so largely negative and tentative, it has been roundly condemned by both sides to the bitter controversy raging between the "wets" and the "drys." Its most valuable contribution has been to point out the need for better and more uniform records of arrests for drunkenness, of cases of alcoholic morbidity and mortality, of violations of law, prosecutions, sentences, etc., so that after a sufficient period of 10 or 20 years has elapsed we may be able to reach conclusions having scientific validity.

The Federal Council report does furnish some significant samples of data carefully selected from good sources and scientifically handled as far as the samples go. The results of a questionnaire that brought a 10% return from 2,700 members of the National Conference of Social Work—a group of persons enjoying unusual opportunities for careful observation—showed a large preponderance of favourable replies as to the effect of prohibition on the homes of working people in better furnishing of the homes, larger proportion of the husband's income going to the wife and family, improved marital relations, better sanitary and health conditions in homes, better mental health of the home as shown by better family co-operation, respect of children for parents and of parents for children, and by higher educational ideals. Favourable replies also preponderated with respect to community effects such as less children's delinquency, less malnutrition among young children, and liquor for minors less accessible; on the contrary, more drinking by young people as compared with pre-prohibition times, and a worse attitude toward law enforcement and respect for laws in general.

*American Bankers' Association Figures.*—The official figures of the American Bankers' Assn. for Savings and Individual Bank Deposits are: The *per capita* savings deposits in the United States have increased from \$89 in 1912 to \$137 in 1920 and \$186 in 1924, while the *per capita* total deposits for the same years were \$175, \$306, and \$367 respectively, and total savings deposits amounted to nearly 8½ billion dollars in 1912, over 14½ in 1920, and over 20½ in 1924. Likewise, total individual deposits increased from more than 16½ billions in 1912 to 32½ in 1920, and over 41 billions in 1925; the total number of savings depositors increased from 12½ millions in 1912 to nearly 21 millions in 1920, and over 38½ in 1924. While, of course, other factors besides prohibition enter into this result "it would be idle," says the F. C. report, "to dispute the assumption that prohibition has been a factor, and an important one, in keeping savings deposits on a high level."

Mr. F. Ernest Johnson, in summarising his F. C. report, says ("Prohibition Without Propaganda," *Atlantic Monthly*, Feb. 1926): "Our first important finding was the undoubted material and social gain that has resulted to the nation as a whole from the outlawing of the liquor traffic and particularly from the passing of the saloon. Living conditions among the working people improved, savings were increased, the death rate from alcoholic diseases declined, cases of dependency due to alcoholism became less numerous, arrests for drunkenness fell off very materially, and there was a reduction in the number of arrests for other offences. But the second major finding of the study revealed that these gains were not entirely permanent. The impressive decline terminated abruptly in 1920 or approximately at that time, and a counter-trend was at once established. This trend has continued with disquieting steadiness since that time, with this reservation, that the picture for 1924 shows some indications that the present year may mark the climax of the reaction." The third major finding, he shows, had to do with enforcement. The conclusion was that the machinery of enforcement was stronger in 1925 than it was in 1920 and that the rise of the liquor curve indicates the extent to which the outlaw liquor industry has outstripped the efforts of the Government to perfect its own organisation.

*Drug Traffic.*—Among the minor findings is that prohibition has had no effect either way upon drug addiction and the drug traffic. This conclusion is supported in an important survey of prohibition and drug addiction prepared by the committee on

traffic in opium of the Foreign Policy Assn. and sent to the prohibition unit, July 8 1925. Likewise the F. C. report gives no support to the theory that prohibition has caused a moral breakdown among young people, and this conclusion is substantiated from many other sources. The wholesale charge that respect for law is being broken down by the want of observance of the prohibition laws is shown to rest upon a gratuitous assumption. Finally, the report stresses as its most conclusive finding that social legislation is not a substitute for social education and that "the illicit liquor traffic will be finally overcome only when and where education in temperate living strongly reinforces the arm of the law."

*Mr. Hoover's Views.*—To revert to the economic issue, so competent an observer as Secretary Herbert Hoover is not quite sure of the moral results that can be safely claimed but stresses and emphasises an economic factor of the greatest importance, namely, the increased productivity of labour. In a formal statement as late as March 1925 (*Christian Science Monitor*) he said:

There can be no doubt of the economic benefits of prohibition. Viewing the temperance question only from this angle, prohibition has proved its case. I think increased temperance over the land is responsible for a good share of the enormously increased efficiency in production, which statistics gathered by the Dept. of Commerce show to have followed passage of the dry law. Exhaustive study from many angles of production over average periods 10 years apart, before and since the War, would indicate that while our productivity should have increased about 15% due to the increase in population, yet the actual increase has been from 25 to 30%, indicating an increase of efficiency of somewhere from 10 to 15%.

Mr. Hoover also says: "There is no question, in my opinion, that prohibition is making America more productive" and that the increased productivity of labour, which is to be attributed to improved labour-saving devices and the elimination of waste as well as to prohibition, but for which prohibition is largely responsible, is something over and above the natural increase which arises from increased population, higher prices and the inflated dollar. Agriculture is cited as a particularly good example where there has been no increase in the number of farmers for a decade but an annual increase of 7.5 to 17.5 million tons in average exports of agricultural products, which shows that the individual farmer has increased his efficiency in production from 15 to 20%.

*As a Moral and Political Question.*—The "drys" have been inclined perhaps to overwork the economic argument and the "wets" to over-emphasise the "incubator of crime" argument and to shift the controversy to the moral and political issues involved. The Federal Census of Prisoners 1923 preliminary report, made available in Dec. 1925, throws some light on moral aspects. Commitments to Federal and State prisons and reformatories, and to jails and workhouses, including all county and municipal penal institutions and certain State institutions used for prisoners convicted of misdemeanours, or minor offenses, show for the years 1910 and 1923 (the latter seems to be almost the peak year for the reaction trends affected by prohibition); total commitments, ratio per 100,000 population, 1910 equals 521.7, 1923 equals 325.1, a decrease of 37.7%; drunkenness, 1910 equals 185.9, 1923 equals 83.1, a decrease of 55.3%; disorderly conduct, 1910 equals 99.9, 1923 equals 48.5, a decrease of 51.5%; violating liquor laws, 1910 equals 8.4, 1923 equals 35.8, an increase of 326.2%.

Behind every moral and political issue lies an individual or group economic experience, out of which the moral and political concepts arise and in which they have their roots. Prohibition is fundamentally an economic issue. As that is finally determined in the sober judgment and experience of the American people prohibition will fail or become the accepted permanent policy of the nation. The amendment may never be eliminated from the constitution but it might become as much of a dead letter as the constitutional method for electing the President has been for a century or as ineffective as the 15th Amendment has been for a half-century. That will depend upon the final judgment of the majority of the people upon the economic facts and results. The moral and political questions concerning its enforcement and its effect upon public morals and upon political institutions of the

republic will be shaped accordingly. In a country as large and rich in material resources and capacity for self-government as the United States, it is futile to say that prohibition cannot be enforced, if it can be economically justified, whether a large majority or a respectable minority favour it as a matter of personal preference. That might have been true of even the largest single states surrounded by "wet" areas in close economic relations and activities. It is hardly likely that international sanctions will be necessary for a country as isolated as the United States, though it is by no means certain that they will not be forthcoming as fast as the economic evidence for national prohibition is adequately ascertained and made known. Until that evidence becomes much more conclusive than it is to-day or will likely be for some years, perhaps a generation to come, the average man is apt to rely upon his instinctive moral and political judgments to carry on the social experiment of national prohibition.

#### PROHIBITION IN CANADA

In Oct. 1920 prohibition was defeated in British Columbia, but a referendum re complete prohibition of the liquor traffic was carried in Nova Scotia, Manitoba, Saskatchewan and Alberta. In April 1921 Ontario voted Prohibition, and in May Government control became effective in Quebec. In 1923 Manitoba adopted a scheme of government control, a change of policy which was followed by Saskatchewan and Alberta. In Oct. 1924 a plebiscite taken in Ontario gave a majority in favour of the continuance of the Ontario Temperance Act, but the majority in favour of prohibition was considerably reduced. In July 1923 a vote was taken under the provision of the Canada Temperance Act in the county of Stanstead, Quebec, when repeal was carried by a large majority and became effective from Sept. 1923. Seven provinces have carried plebiscites in favour of the prohibition of the importation of intoxicating liquors. Exportation is prohibited from New Brunswick, Prince Edward Island, Manitoba, Alberta and Saskatchewan. It thus appears that whether impressed by the effects of prohibition in the U.S.A. or swayed by the merits and advantages, economic and personal, of a publicly regulated liquor traffic, feeling in Canada is moving towards a wide modification of the position taken up under the stress of war conditions.

In support of the conclusion that the Quebec Liquor Act has proved successful in reducing drunkenness, bootlegging and the illicit manufacture of inferior alcohol, in stimulating the demand for beer and light wines and in effecting a diminution of the use of hard liquor, the following figures are of peculiar significance:—

| Arrests for Drunkenness |       |       |       |       |       |
|-------------------------|-------|-------|-------|-------|-------|
|                         | 1920  | 1921  | 1922  | 1923  | 1924  |
| Montreal                | 7,608 | 6,363 | 4,356 | 3,761 | 1,218 |
| Quebec                  | 1,162 | 875   | 833   | 833   | 288   |
| Hull                    | 1,894 | 1,144 | 1,004 | 876   | 263   |

The Quebec Liquor Commission established stores where alcohol is sold in sealed packages—one bottle at a time between 9 A.M. and 6 P.M. except on Saturdays (9 A.M. to 1 P.M.). On holidays and election days the stores are closed. Wines and beers are sold in licensed hotels, restaurants, etc. The alcohol sold is submitted to analysis. No store for the sale of alcohol or wine may be opened in a municipality which is opposed to it. (See *Canada Year Book* and the *Report of the Quebec Liquor Commission*.)

#### PROLONGATION OF VIGOUR: see REJUVENATION.

**PROPAGANDA.**—With the advent of the World War, propaganda took on the character of a new, if inexact, science. Germany was the first to realise its value as one of the weapons of war and was the first to reap advantages from the military situation; for propaganda, a word which has come into considerable disrepute, is in its proper sphere the presentation of a case based on reliable evidence, and the best and most effective propaganda during the War was military success. But there was a large and vitally important field concerning war responsibilities and war aims, which, together with the nature of military and naval progress, influenced the decision of countries which subsequently became combatants on one side or the other. It was an important, if subsidiary, element of diplomacy and war operations.

Propaganda had several distinct phases. The first was the maintenance of what was known as "the home front," the second the disheartening of the enemy, and the third the persuasion of neutral states and potential allies of the justice of the cause and its inevitable victory, not only from the point of view of military co-operation, but also from that of obtaining necessary supplies.

*The Home Front.*—The first phase, namely the maintenance of national determination, started with everything in its favour. In all the countries which entered the War during the first few weeks, the people were solidly behind their governments, believed in the cause for which they were fighting and were confident of victory. Public men of all parties and every class, and virtually the whole national press became propagandists at once, and this also in itself was already, though incidentally, propaganda abroad. It became necessary, however, to organise it carefully as the War developed, especially to meet times of stress and failure.

Of all people, it is probably just to say that the British were treated most frankly by their Government, but the exigencies of the struggle for existence involved in all states a not always inexcusable suppression of facts. This, accompanied by exaggeration of facts, was undoubtedly responsible to some extent for giving propaganda its bad name, but the main cause was falsification of facts, sometimes through incomplete information but more frequently through deliberate intention. It took some states a long time to realise, and some others never fully learnt, that false information ultimately defeated its own purpose, but it sometimes gave momentarily apparent advantages. A military engagement, for example, described by both sides as a victory gave the propaganda advantage to the loser, at any rate until such time as experience had indicated how such contradictory statements should be read and analysed, because it left in doubt the rightful claims of the victor. False news in the political field was very much more difficult to check.

*Work in Neutral States.*—One of the hardest problems was to retain or gain the sympathy of neutral states and to dishearten the enemy. In some of the smaller states there was reluctance, while the military situation was uncertain, definitely to show sympathy for one side or the other, and the rigid censorship maintained by all nations at war made it difficult for anything but favourable versions of events to reach the home public. The methods pursued in this task were roughly the same in all countries. Governments built up special departments composed of people acquainted—or supposed to be acquainted—with publicity methods and with the political and psychological conditions of different countries of the world. There was a great difference, for example, between the way in which a case should be made to appeal to the United States of America, to Holland and to the Far-East.

Every government issued a regular wireless service; large sums of money were spent on cables, and on subsidising press agencies and neutral newspapers (which sometimes became so partisan as to lose completely their value); new agencies were started in camouflaged form and in some cases new journals and illustrated periodicals published. Every embassy and legation was a propaganda centre in some form or other. Neutral pressmen were invited to the fighting front to describe the confidence of the soldiers; to the fleets to see their invincibility; to the home factories to observe their adequacy for meeting all requirements; to the prisons to describe the happy state of war prisoners. Articles and letters were sent abroad in thousands. This was all organised from home, with agents of every sort and kind all the world over, including neutrals and in a limited number of cases, enemy subjects as well.

Switzerland, situated between France, Germany, Austria and Italy and containing a mixed population with affinities with both sides in the struggle, was a cockpit of propaganda, diplomacy and espionage. Agents poured into a country which was such a useful centre to get material into enemy lands on either side. It is recorded, for example, that Lenin, who, with Trotsky and Radek, lived some time in Switzerland, was able to get revolutionary pamphlets from Berne to the Russian and German trenches, and many ruses were successfully adopted to accomplish this sort of thing all round.

The world was filled with a mass of confused and contradictory tales. For a considerable period this was so baffling that propaganda had the effect of cancelling itself out, but later on a certain art was developed in making proper deductions; it was not impossible, even amidst the confusion, to gain an approximate idea of what was, in fact, happening. The wiser participants in the game found that often a studied understatement had more effect, actual and ultimate, than glowing exaltation.

*Wireless Propaganda.*—In the wireless fight, the Germans, with their powerful station at Nauen, were better equipped technically than any of the other powers, and this was important for them as they were prevented by their geographical war position from using many of the ordinary means which were at the disposal of their opponents for reaching countries far afield. They used it not only to reach more distant parts of the earth than could be at first reached by other stations, but also for the despatch of press messages by neutral press correspondents, and as many as 10,000 or 15,000 words a day were included in this way for America. Not much of this wireless, either from Germany, from Great Britain or from other countries received newspaper publicity, but it undoubtedly served many useful purposes. It remains a puzzle to understand why some enterprising neutral paper did not regularly publish in parallel columns the arguments and descriptions issued from the various wireless stations. They were sometimes ridiculous and frequently amusing. The practice of the British Govt. was to release the more ridiculous and amusing features of enemy wireless, which could be done with great effect.

Much was made on either side of admissions, or of appearances of discouragement in enemy countries, two of the more notable incidents being the German use of the Lansdowne letter which questioned the possibility of complete victory

for either side, and the British use of Prince Lichnowsky's memorandum on the British pre-War desire and work for peace. They were given the utmost possible circulation in many languages. Exhaustive statistical information was issued to show that Germany was on the point of starvation, or that her manpower and supplies were failing and the same methods were applied to show the precarious situation of Britain.

These accounts of enemy distress had considerable effect on the home populations, despite the fact that each side was able to convince its own people of the exaggerations or suppressions of the other. The German accounts of the results of air raids on Great Britain could be actually tested by the population, and the remarkable success with which the British people were kept ignorant of the incident of H.M.S. "Audacious" (which was fully described in the neutral and enemy press) was not without its value to Germany, whatever might have been the military reasons for British suppression. Exaggerations served some purpose, however, in forcing admissions from opponents. The German claims in the submarine campaign compelled the British Govt. to give its people some idea of what the circumstances were, and depressing facts had to be issued. These, in turn, just because they were unpleasant admissions, had the effect of diminishing belief in German claims.

*Efforts on the Fighting Front.*—Direct efforts to make an impression on the enemy, apart from the intense efforts through neutral countries, were made on the fighting fronts. Imitation newspapers, leaflets and all kinds of material were sent across the lines by means of aeroplanes, balloons and hand-grenades, but it is doubtful whether this had any real influence until the actual military situation made the information at least plausible. The British and Allied peoples undertook a big offensive of this kind in 1918. The organisation of it on a large scale began in England before the great German offensive in March, but its execution reached its full height when it was clear to all that Germany must lose the War. The millions of leaflets dropped over and behind the German lines during the summer of 1918 brought deadly confirmation to the already disturbed minds of the German soldiers and people, and although it was not unnatural for the German military leaders to attribute, as they subsequently did, an undue share of the causes of their defeat to this propaganda of their opponents, it did, very probably, by helping to confirm the growing German fears, take the heart out of any further prolonged resistance which might possibly have been demanded of them.

*Propaganda After the Armistice.*—With the end of the War the political side of propaganda was continued with reinforced energy. At the Paris Peace Conference there was an inexhaustible supply of documents containing a whole variety of arguments and claims, and no body of statesmen could ever have met in circumstances where the enormous problems to be settled were "propagandised" with such highly developed resources. This intensity gradually slackened during the years after the peace treaties had been concluded, but there has remained a widely applied system of official Press bureaux as a part of the normal State equipment, with Press attachés at embassies and legations to explain and defend national peace-time causes. They differ somewhat in character and influence and on the whole are marked by a growing sobriety. But there still exists a propaganda state of mind which differs from anything experienced before the war. (H. R. C.)

**PROPELLER:** see AIRSCREW.

**PROPERTY, LAW OF** (see 22.440).—From time to time in English history drastic changes in regard to land tenure have been carried into effect as part of the evolution of national life. One such change has been accomplished by the passing of the Law of Property Act 1922 and the series of Acts into which that great measure was subsequently divided. The effect is almost comparable with that produced upon Roman Property Law by Justinian's legislation. The new Acts consolidate and codify all that remained unrepealed of the statute law relating to land from the time of Edward I. to the present date, incorporating in the process much of the common law that has hitherto obtained.

The Act of 1922 finally carried into effect much of what was "in the air" in Commonwealth days when military tenures were abolished and suggestions were first made for the starting of a land register—an object in part effected during the 19th century. The history of this achievement may be told quite shortly. In 1908, following attempts begun in 1895 to amend the existing law in various ways, a royal commission was appointed to consider the working of the Land Transfer Acts. As a result of the work of the commission, a bill was introduced into Parliament shortly before the outbreak of the World War with the object of assimilating the law of real to that of personal property. This was suspended until after the War, but in 1919 a committee was nominated to advise upon the whole matter. This resulted in a bill being introduced in 1920 in the House of Lords, which, after review by a joint committee of both Houses, was approved and finally passed as the Law of Property Act, 1922.

Two principal motives underlay the Act. It aimed at simplifying generally the law relating to the tenure and devolution of land and houses and at cheapening the cost of sale, purchase, mortgage and other like transactions by cutting away the anomalies and abuses still left as remnants of that feudal system which itself was brought to an end more than 200 years ago. In order to bring about these results it was first of all necessary that there should be one set of rules only governing property in land. Hence all local and customary tenures had to be abolished and that has been done just as the old military tenures were done away with in Commonwealth times and their abolition confirmed by the Statute of Tenures passed in the first year of Charles II. Moreover, there being two systems of land tenure in operation side by side, viz., freehold, and customary (including copyhold) each with different incidents and each submerged in archaic technicalities peculiar to itself, it was most essential that in land, as in chattels, there should be one legal, absolute and ostensible ownership, whatever other interests there might be apart from ownership. That has been achieved by converting all freehold estates into fee simple, subject, where necessary, to appropriate equitable interests; whilst mortgage is now made by demise, the mortgagor having the legal estate and the mortgagee holding for a term of years—thus reversing the former position, in which the mortgagee had the legal and the mortgagor an equitable estate.

The simplification of the law of property itself was accompanied by a simplification of the several processes by which sale, purchase, mortgage and the like transactions could be carried through. What had been begun by the Act for the Abolition of Fines and Recoveries in 1833 and continued by the various Conveyancing Acts since passed has been completed notably by the repeal of the Statute of Uses. Further, the law of realty has now been largely assimilated to that of personality. Primogeniture has been abolished, and both real and personal estate devolve upon intestacy in the same way. The heir-at-law disappears and an entirely new code is provided which places husband and wife on the same terms with regard to each other's property and the property of intestate children.

The wide scope of the Act of 1922 was shown in its preamble, which ran as follows: "An Act to assimilate and amend the law of real and personal estate, to abolish copyhold and other special tenures, to amend the law relating to commonable lands and of intestacy, and to amend the Wills Act 1837, the Settled Land Acts 1882 to 1890, the Conveyancing Acts 1881 to 1911, the Trustee Act 1893 and the Land Transfer Acts 1875 to 1897." After it had been passed, its operation was suspended until an amending Act embodying various modifications had been passed and later a series of measures into which its various sections, as amended, had been divided and embodied.

#### ABOLITION OF CUSTOMARY TENURES

There still remains unrepealed, however, a substantial portion of the Act of 1922 itself, viz., parts V. and VI., which deal with the abolition of copyhold and customary tenure and the extinguishment of manorial incidents; part VII., which relates to the conversion of perpetual leaseholds; and certain schedules. The effect of these enactments may be summarised thus:—

1. *Enfranchisement of Copyholds.*—As from Jan. 1 1926 every parcel of copyhold land became automatically converted into freehold, and the original tenant (or the person for the time being entitled) was to receive a document termed an "assurance," which, upon production within six months thereafter to the steward of the manor of which the land formed part and upon payment of all dues in respect of fines, 100 shillings, heriots, rents or fees, was to be endorsed by a certificate which operates to give to the holder the full legal estate.

2. *Extinguishment of Manorial Incidents.*—Certain manorial incidents connected with copyhold tenure are made to disappear at once, viz.:—

(1) Liability for forfeiture for conveyance or attempted conveyance or for alienation without licence, whether by sale, lease, mortgage, or otherwise;

(2) Customary suits and services and fealty;

(3) Escheat (subject, however, to escheat to the Crown in certain cases of intestacy as *bona vacantia*); and

(4) Borough English, gavelkind, and other customary modes of descent, dower, freebench, tenancy by the curtesy, and like customs, in pursuance of the new law as to devolution of property (see Administration of Estates Act below).

Another set of manorial incidents are "saved" temporarily—that is to say they remain as at present until extinguished in accordance with the general scheme for their ultimate abolition. These are:—

(1) Quit-rents, chief-rents and other similar rents and payments;

(2) Fines, reliefs, heriots and dues (including fees payable to stewards);

(3) Forfeitures other than as set out above; and

(4) Rights as to timber.

All these must be extinguished in one of three ways: (a) by agreement as to compensation between lord and tenant, or (b) by notice to fix compensation served by one upon the other (but the lord may not serve such notice before Jan. 1 1931), or (c) if no agreement or no service of notice has been effected within 10 years after Jan. 1 1926 then by automatic expiry at that date.

Certain manorial rights and liabilities are preserved. They are not to be regarded as "manorial incidents" for the purposes of the Act, but they may become such by agreement between the parties. They are:—

(1) Rights of common enjoyed by the tenant;

(2) Mining and mineral rights, franchises, royalties and privileges in respect of fairs and markets and sporting rights enjoyed by the lord; and

(3) All existing liabilities, however arising, as to the construction or maintenance or cleansing of dykes, ditches, canals, sea or river walls, piles, bridges, levels, ways and other works required for the protection or general benefit of any land within a manor or for abating nuisances therein.

Compensation for the extinguishment of manorial incidents is payable to the lord of the manor according to scales provided in the rules made by the Minister of Agriculture (No. 810 of 1925), and stewards are also compensated for loss of their office and fees upon an equivalent basis. Compensation moneys may be paid either in a lump sum or by a terminable rent-charge.

3. *Conversion of Perpetually Renewable Leaseholds.*—Perpetually renewable leases and underleases are converted into long terms (i.e., of 2,000 years) at the rent and subject to the covenants and conditions and other provisions originally payable or enforceable.

Out of the rest of the Act of 1922 have sprung seven new statutes, each of which is in itself a consolidation Act, viz., the Law of Property Act 1925 (15 Geo. 5 c. 20); the Settled Land Act 1925 (15 Geo. 5 c. 18); the Trustee Act 1925 (15 Geo. 5 c. 19); the Land Registration Act 1925 (15 Geo. 5 c. 21); the Land Charges Act 1925 (15 Geo. 5 c. 22); the Administration of Estates Act 1925 (15 Geo. 5 c. 23), and the Universities and College Estates Act 1925 (15 Geo. 5 c. 24). The whole system of legislation came into operation on Jan. 1 1926. From the summary which follows we omit the Universities and College Estates Act, which consists only of consequential provisions relating to the Universities of Oxford, Cambridge and Durham (with their constituent colleges) and the public schools of Eton and Winchester.

#### TENURE AND DEVOLUTION OF PROPERTY IN LAND

*Estates and Interests in Land.*—The Law of Property Act 1925 introduces far-reaching changes into the English law relating to the tenure, transfer and devolution of property in land. It is divided into 12 parts and contains seven schedules. It embodies the changes originally introduced by the Law of Property Act 1922 as amended by the Law of Property (Amendment) Act 1924 and in effect provides an entirely new code of law governing the subjects within its scope.

*General Principles as to Legal Estates, Equitable Interests and Powers.*—As from Jan. 1 1926 the only estates in land capable of subsisting or of being conveyed or of being created at law will be:—

- (a) An estate in fee simple absolute in possession;
- (b) A term of years absolute;
- and the only interests or charges in or over land:—
- (a) An easement, right or privilege for an interest equivalent to an estate in fee simple absolute in possession or a term of years absolute;
- (b) A rent-charge in possession issuing out of or charged on land, being either perpetual or for a term of years absolute;
- (c) A charge by way of legal mortgage;
- (d) Land tax, tithe rent-charge, and any other similar charge on land which is not created by an instrument;
- (e) Rights of entry exercisable over or in respect of a legal term of years absolute, or annexed, for any purpose, to a legal rent-charge.

All other estates, interests, and charges in or over land take effect as equitable interests.

The only powers now left to operate are such as are (a) vested in a legal mortgagee; (b) vested in an estate owner in right thereof and exercisable by him or by another person on his behalf; and (c) special statutory powers under various Acts. All such are to be known as "legal" powers whilst all others are to be termed "equitable" powers. The Statute of Uses is repealed together with section 62 of the Conveyancing Act 1881—all legal interests of the sort formerly created thereunder to be equitable interests only, if created after 1925. Liability to death duties is made incidental to the ownership of legal estate, except in the hands of a purchaser for value, but without prejudice to existing liabilities. The parties accountable will be (a) the personal representative and (b) the legal owner.

An important change is made by treating husband and wife as two persons for all purposes of the acquisition of property under a disposition operating after 1925.

*Contracts, Conveyances and other Instruments.*—Part II. of the Act re-enacts various provisions of the repealed statutes and introduces numerous variations in the existing law and practice of conveyancing. It deals very drastically with the subject of title on sale, providing *inter alia* for the substitution of 30 years in place of 40 as the period of the commencement of title. It re-enacts with some variations part of section 4 of the Statute of Frauds, making it necessary that in future all contracts for the sale or other disposition of land or any interest in land shall be in writing. Whilst, with a few exceptions, all conveyances of land or of interests therein are to be void for the purpose of creating legal estate unless made by deed.

In abstracts prepared after 1925 it is not to be deemed necessary or proper to include an instrument relating only to interests or powers that will be "over-reached" by the conveyance of the estate; but equitable interests or powers which will not be so over-reached must be properly disclosed.

*Mortgages, Rent Charges and Powers of Attorney.*—Where a mortgage of land is created by deed expressed to be by way of legal mortgage the mortgagee is to have the same protection, powers and remedies as if he had, in the case of freeholds, a mortgage term of 3,000 years (that being the term into which under the Act all existing mortgages are to be converted); whilst appropriate provisions are added to bring mortgages of leaseholds into sub-terms on the same lines. The effect will be that in future each party will get a term—the first mortgagee for 3,000 years—and subsequent mortgagees a slightly longer and sub-mortgages a slightly shorter term than the first mortgagee by way of preserving a nominal reversion.

*Law of Entail.*—In future, an estate tail will only be created by using the words "heirs of the body" or a statutory equivalent, in deeds and wills. Enrolment of disentailing assurances is done away with, and the "Rule in Shelley's Case" is abrogated.

*Leases and Tenancies.*—Here some important changes have been introduced, including the abolition of the doctrine of *interesse termini*, i.e., the right which rests in the lessee of lands under a demise before he enters into possession and becomes tenant under the lease. In future, all terms for years absolute take effect from the date fixed for commencement of the term, without actual entry and by way of transmutation of possession.

*Powers of Appointment.*—Special provisions are made to meet cases of fraudulent appointment. An instrument purporting to appoint is not, save in certain exceptional circumstances, to be void against a purchaser or person deriving title under him in good faith, dealing with an appointee not less than 25 years of age, for valuable consideration, and without negligence.

*Perpetuities and Accumulations.*—The rule prohibiting the limitation of land to the issue of an unborn person after a life estate given to that unborn person is no longer to operate. Other changes are made affecting perpetuities and the accumulation of surplus income.

*Married Women and Lunatics.*—The existing statutory provisions affecting these two classes of persons are re-enacted in more definite form—additional powers being given to the Court in regard to both. In these respects the Act dovetails in with the provisions relating to these classes of persons to be found in the Settled Land and Trustee Acts (which see).

*Voidable Dispositions.*—The law is strengthened in regard to fraudulent conveyances.

*Wills.*—Necessary changes to meet the general scheme of law reform are made in the disposition of income derivable from freehold land.

Marriage is not to revoke a will expressed to be made in contemplation of marriage; and the law is clarified as to the right of a bastard to dispose of realty or chattels real by his will.

*Public Access to Commons.*—Of the miscellaneous matters being dealt with in Part XI. the most important is the provision giving right of access to the public for "air and exercise" to metropolitan commons, manorial wastes, and any manorial lands subject to rights of common which are made subject, temporarily or otherwise, to these added public rights by the wish or consent of the manorial lord.

*Administration of Estates.*—By the Administration of Estates Act 1925 the law relating to the administration of the estates of deceased persons has been drastically altered, and the statute book has been cleared of the whole growth of legislation upon the subject that has accumulated since the time of Edward I. Its sweeping changes can best be appreciated by reference to the Act itself; and its text—unlike that of most Acts of Parliament—is by no means difficult for the layman to follow. One of the principal objects of the whole scheme of reform was to assimilate the law of real to that of personal property. The Administration of Estates Act carries that assimilation into practice chiefly in respect of the law of intestacy. Under the old law, which obtained until 1897, when the net value of the real and personal estate of a person dying intestate exceeded £500, his widow (if any) was entitled to £500 as a prior charge subject to which all freehold estate went straight to the heir-at-law without the intervention of any personal representative, whilst leasehold property was classified as personal estate and as such went to the personal representative. The Land Transfer Act of 1897 introduced intervention of the personal representative in the devolution of real estate; but now, by the Administration of Estates Act 1925, legal heirship, dower and curtesy and all similar customary methods of descent are abolished and an entirely new system is set up under which real and personal estate both devolve upon the personal representative to be held by him, as to the real estate upon trust to sell the same and as to the personal estate to call in and realise also, and then, after payment out of the total proceeds of the entire estate of funeral and testamentary expenses and debts of deceased, to dispose of the residue in accordance with the rules of distribution applicable to the case.

#### TRUSTEES AND SETTLEMENTS

*Trustee Act 1925.*—This measure consolidates the whole law regarding trustees, their duties and liabilities, into one Act, absorbing in the process the various changes introduced by the Law of Property Acts 1922 and 1924. The provisions of the Act require to be read at many points in conjunction with one or other of the several statutes grouped with it in the entire scheme for amending the law of property. Thus, in the matter of vesting deeds and trust instruments generally its provisions dovetail in with those of the Settled Land Act; and in regard to trusts for sale with those of the Law of Property Act 1925. Other provisions correlate closely with those of the Administration of Estates Act.

Enlarged powers are given to trustees with regard to compounding of liabilities, employment of professional agents, sale by auction and other administrative matters. Greater indemnity is provided against their liability for negligence for which they personally were not to blame. Enlarged powers are bestowed in regard to the lending of trust monies upon security for repayment and in regard to mortgages upon land sold or leased up to 500 years. On the other hand, there is increased liability in respect of investment in industrial securities. Generally, the Act reviews the whole subject of investments. Entirely new arrangements are made for the appointment and discharge of trustees, in the interests of expedition and the saving of expense—particularly by obviating as far as possible the need for applications to the Court.

*Settled Land Act 1925.*—This Act, standing alone, constitutes a great measure in itself. It contains 120 sections and five schedules. It repeals and consolidates all existing enactments relat-

ing to settled land in England and Wales and introduces many new provisions originating in the Law of Property Act 1922 and the later amending Act of 1924.

The Act defines "settlements" and "compound settlements" and makes special provisions in the interest of infants and married women. It applies the new system affecting estates in land under the Law of Property Act 1925 to settled land and deals in detail with vesting deeds and trust instruments. The whole position of the tenant-for-life and of a limited owner having the powers of a tenant-for-life comes under review, and extended freedom is given in regard to sale and exchange, leasing powers (both in regard to the land or to any easement attaching to it), investment of capital moneys, expenditure on improvements, etc. A new power is given to treat as one whole estates settled by different settlements upon the same limitations, and special provisions are made for the protection or recovery of land settled or claimed as settled.

The powers of trustees in regard to management of landed estates during the minority of the tenant-for-life are reviewed, and important restrictions are imposed in some directions, while in others greater freedom is permitted and the powers and duties of trustees generally are rendered less onerous. These powers and duties, however, are more fully dealt with in the Trustee Act.

#### REGISTRATION OF TITLES AND CHARGES

*Land Registration Act 1925.*—Under this statute a remodelled scheme of law relating to the registration of title has been introduced, and although it has not created any new legal principle it has done what was needed to bring registration of title into line with the other changes effected by these Acts. In future, the only person who may apply to have a title registered must be either (1) the owner of a legal estate (not being an infant) or (2) a person—other than a mortgagee or a person who has merely entered into a contract to purchase—who is entitled to demand a legal estate. Prior to this, mere contractors to purchase could register. Formerly, money was raised on registered land by way of registered charge. This system has been enlarged and a registered proprietor may raise money alternatively by mortgaging the land as though it were not registered and protect it by a "caution" in a prescribed form—the land certificate in either case then being deposited in the registry until the mortgage or charge is cancelled.

Registration of title has not hitherto been compulsory in all parts of the country. It has been open to a County Council by resolution adopted at a meeting attended by two-thirds of its members to enforce compulsory registration within its own county. This right is continued for the time being, but 10 years hence (*i.e.* in 1936) the new method will be introduced of requiring compulsory registration in any county by Order in Council subject to the right of the County Council or of any law society whose area is affected to insist upon a public enquiry before any such Order is made. Where unregistered land situated in a compulsory area is sold and conveyed the purchaser is required to apply for registration within two months—otherwise the conveyance will be void as regards the legal estate. Adverse possession will give a good title to registered land upon proof of title in the same way as it will to unregistered land: so that if a man is in adverse possession of registered land under circumstances which (had it not been registered) would have enabled him to extinguish the title of the registered proprietor he will be able to secure the legal estate by virtue of his adverse possession.

The Act contains new provisions in regard to the bankruptcy of registered proprietors of land. When a bankruptcy petition is presented it may be registered under the Land Charges Act and a "creditors' notice" will then be placed against the title—which will affect the rights of all creditors. If, in due course, the proprietor is adjudicated bankrupt, his trustee is entitled to become registered proprietor, but he cannot deal with the land until he has become so registered. Moreover, if he fails to do so immediately he may be postponed to other claimants in certain events.

*Death Duties.*—Very important provisions (some of them entirely new) relate to death duties. As regards such duties arising before the Act the old provisions of the Land Transfer Acts remain: but as to those becoming due after Jan. 1 1926 new rules have been made. When a registered proprietor dies a notice of the pending liability is to be entered on the register, and thereafter no transactions will be registered without the cognisance of the Inland Revenue authorities. The liability for death duties in respect of the land will rest upon (a) the personal representative in whom it has become vested, or, alternatively, (b) in the registered proprietor other than a purchaser who has acquired it free from the charge in respect of duties.

*Land Charges Act, 1925.*—This, an Act dealing entirely with ministerial matters arising out of the new legal system, is described in its preamble as "An Act to consolidate the enactments relating to the registration of pending actions, annuities, writs, orders, deeds of arrangement, and land charges, and to searches." It aims at simplifying the procedure by which purchasers of land can find out what, if any, encumbrances exist upon it and all else regarding threatened litigation affecting it. One very important change is involved in the requirement that all mortgages which are not protected by the deposit of title deeds must be registered as land charges. Such registration is to operate as formal notice, and failure to register will render the charge void as against a purchaser. (W. M. F.)

#### PROPORTIONAL REPRESENTATION: *see* ELECTORAL LAWS.

**PROTESTANT EPISCOPAL CHURCH** (*see* 22.473a).—The progress of this Church in the United States, so far as its organisation and official life are concerned, is registered largely in the activities of its Triennial Convention. In the convention of 1910, stimulated by the recent missionary conference in Edinburgh, action was taken toward calling a world conference on faith and order for all churches believing Jesus Christ to be God and Saviour of the human race.

The date and place set for the conference was 1927 in Lausanne. All the major churches in Christendom, excepting the Roman Catholic Church, will send representatives. The movement is indicative of the interest of the Episcopal Church in unity. In 1913 the long-standing Article of the constitution providing for provincial organisation was made effective by the passage of a canon uniting the dioceses and missionary districts of the Church into eight provinces with limited jurisdiction. Every attempt to give the provinces real authority to the relief of the presiding bishop and of the general convention has thus far (1926) failed. Under the leadership of the Bishop of Massachusetts (Dr. Lawrence), in accordance with action by the general convention of 1913 a pension fund was set up on actuarial calculations, taking cognisance of accrued liabilities, which has since become the model of similar funds in other churches.

*The Book of Common Prayer.*—The revision and enrichment of the Book of Common Prayer (*see* PRAYER BOOK) has been discussed and progress made, consuming much time, for five successive conventions, and comes to a close in 1928. During the World War the Episcopal Church took its stand behind the government and lent its personnel and resources in aid of the country and its Allies. In the last convention (1925) action was taken in the House of Bishops looking toward a declaration of the Church's mind on war.

*The National Council.*—A far-reaching change was made in 1919 in the organisation of the Church by the establishment of the presiding bishop and council as the executive body of the general convention acting between sittings. This body, later termed the national council, began with four departments—missions and church extension, religious education, Christian social service, finance and publicity, "with power to organise such other departments as the work might demand." The budget system was adopted for the general work of the Church. The Rt. Rev. Dr. Gailor was elected president of the council. In 1923 the venerable Bishop Tuttle died after holding the position of presiding bishop of the Church for 20 years. He was succeeded by Bishop Garrett, and upon his death Bishop Talbot became presiding bishop, continuing in office until

Jan. 1925, when he was succeeded by Bishop Murray. Bishop Murray became the first presiding bishop by election, the office hitherto having gone to the senior bishop of the Church by consecration.

The activities of the Church have been greatly enlarged since 1919. Work among foreign-born has been intensified, relations with oriental churches have been enlarged and missionary responsibility systematised and consolidated. Twice—once by a fraction of the lay vote and three years later by a tie vote in the House of Bishops—the Episcopal Church has refused to become a constituent member of the Federal Council of the Churches of Christ in America. In 1925, through its national council, it increased contacts from two to eight with corresponding departments of the Federal Council.

**Statistics.**—The Episcopal Church in 1925 numbered 1,193,321 communicants, an increase of 264,541 over 1910. There were 6,140 clergy (1,400 of whom are non-parochial) and 3,740 lay readers ministering to 8,397 parishes and missions. The number of candidates for Holy Orders was 454. There were 498,814 scholars in Sunday-school. The dioceses and missionary districts numbered 104. The total contributions for 1925 amounted to \$41,746,055. The Episcopal Church is strongest in the great centres of the East, but it declines in strength toward the West. See the *Journal of the General Convention 1910-25*.

(C. H. Br.\*)

**PROTHERO, SIR GEORGE WALTER** (1848-1922), British historian, was born in Wiltshire Oct. 14 1848, being the eldest son of Rev. G. Prothero, Canon of Westminster Abbey. Educated at Eton, he went from there to King's College, Cambridge, of which society he became a fellow. For a time a master at Eton, he soon returned to Cambridge as lecturer and tutor at King's College, where he was senior tutor from 1881. In 1884 he was appointed university lecturer in history; in 1894 he went to Edinburgh as professor of history; and in 1899 he succeeded his brother Rowland, afterwards Lord Ernle, as editor of *The Quarterly Review*. During the World War he was director of the historical section of the Foreign Office and in that capacity he attended the Peace Conference in Paris. He was created K.B.E. in 1920 and died in London July 10 1922.

Prothero's chief historical works are *The Life and Times of Simon de Montfort* and the collection of authorities entitled *Select Statutes and other Constitutional Documents*. He was editor of the Cambridge "historical series" and one of the editors of *The Cambridge Modern History*.

**PROTIĆ, STOJAN** (1857-1923), Yugoslav statesman, was born at Krusivak Jan. 29 1857 and at first entered the Government service. He soon came into conflict with the repressive régime of King Milan and in 1882 became editor of *Samouprava* and a leader of the new Radical party. He was imprisoned for a press offence in 1883 and again in 1885. He held subordinate posts in the Radical Cabinet of 1887. In 1899 an attempt on King Milan's life was used by the Government to rid itself of its Radical rivals. Protić was sentenced to 20 years' hard labour, although, in fact, he had no connection with the crime. Pardoned nine months later, he became director of the National Library. After the revolution of 1903 he represented the Radicals in the first provisional Cabinet under King Peter and remained Minister of the Interior in most of the succeeding Cabinets down to 1907. He was Finance Minister during the Bosnian crisis and again became Minister of the Interior during the period of the Balkan Wars and the European crisis of 1914. Early in 1914 he came into conflict with the "black hand," a secret terrorist organisation in the army. This conflict is one of the best proofs that the Serbian Government had no connection with the "Black Hand" in its alleged share in the Archduke's murder.

Protić remained out of office during the period of coalition Government from Dec. 1914 to June 1917, but continued to exercise great influence in the background. He was returned to office in 1917 and played an active part in the negotiations leading to the Corfu agreement between the Serbian Govt. and the Yugoslav Committee. He showed more comprehen-

sion for the Croat and Slovene standpoint than his colleague Pašić, and when the conflict between Pašić and Trumbić in 1918 delayed the recognition of Yugoslavia by the Allies and created an awkward situation with Italy, Protić was appointed the first Premier of the new Yugoslav State. He was keenly interested in the constitutional problem, and after his resignation in Aug. 1919 published his own draft project. Disagreeing with the exaggerated centralism of Pašić, he declined office in 1921 and drifted steadily away from his old colleague. Protić died in Belgrade in Nov. 1923. His publications include *The Aspirations of Bulgaria* (1916) and *Le problème Albanais*, etc. (1913), issued under the pseudonym of "Balkanicus."

**PROTOZOOLOGY** (see 22.479), is that branch of zoology which is concerned with the group of animals known as the Protozoa. The Protozoa are very interesting and important animals, from both the practical and the theoretical standpoint. Nevertheless, they are all small, and most of them are of microscopic dimensions. To the general public they are therefore invisible, and consequently unknown, except by the 'conspicuous results'—such as diseases—which they occasionally produce. In common speech they are still nameless, though they are popularly included among "animalcules" and "microbes." But these are unscientific and unnatural groups, which comprise all microscopic creatures, both animals and plants; and consequently the protozoa are still confused, in the popular mind, with other "microbes," such as the Bacteria (see BACTERIOLOGY), with which they have no connection.

As an individual science protozoology only became self-conscious at a quite recent period. The name itself, though already in use between 1870 and 1880, only became current after the opening of the 20th century—that is to say, within the memory of many living zoologists. But the science was really born—though not baptised—when the first Protozoa were discovered, in the latter half of the 17th century, by a man who was neither zoologist nor physician, but a draper who occupied the position of chamberlain to the sheriffs of the little town of Delft in Holland—Antony van Leeuwenhoek (1632-1723). This remarkable man made his own microscopes, lenses and all, and turned them upon almost every object which suggested itself to his quick imagination. In the course of his work he examined the water from the leaden gutters of his house, from the well in his courtyard and also fresh rain-water, snow-water, and "the water wherein pepper had lain infused." He found that all these liquids and many others, were not clear and empty when viewed by the microscope, but teeming with living creatures. The discovery was promptly communicated by letter to the Royal Society in London, who published a part of it in the year 1677. Some of the animals which Leeuwenhoek there described can now be identified as Protozoa, and his letter may therefore be regarded as the first page in the history of protozoology.

Leeuwenhoek, the father of protozoology, himself studied and described many Protozoa and his observations were soon repeated and confirmed by others. But for many years protozoology made little progress, and remained essentially what it was originally—an amusement rather than a science. Although many good observations were made and recorded, they were always disjointed and often distorted by fancy and speculation. Many good zoologists regarded with doubt and misgiving everything seen with the microscope, an attitude of mind which has not quite disappeared even in these days of perfect instruments. Even the great Linnaeus (1707-78) never overcame his suspicions sufficiently to incorporate the Protozoa firmly in his system. His mental attitude is shown in the name "*Chaos infusorium*," with which, in 1767, he dubbed a mixed lot of questionable protozoal organisms—the term *Chaos* itself having been suggested, no doubt, by Ovid's "*rudis indigestaque moles*."

But already at this period many workers were convinced that the protozoa—or "infusoria," as they were then called from their occurrence in infusions—have a real existence. The once notorious John Hill (1716-75) in 1752 for the first time scientifically named a number of Protozoa which he had seen in infusions. But it was not until 1773 that a serious attempt was made to reduce the chaos to order by careful observation and description and classification of the "infusoria." This notable work was done by the Danish naturalist, O. F. Müller (1730-84); and his last book, published posthumously in 1786, is the first systematic treatise on protozoology. Müller was able to attempt a comprehensive systematic treatise on the protozoa, because a very considerable advance had taken place in biological thought since microscopic organisms were discovered. Many of the earlier workers, like the uneducated at the present day, believed in spontaneous generation. They believed, with Aristotle, that many "imperfect" animals were bred in mud, water or decomposing matter; and so long as this view was tenable there was no reason why these misbegotten offspring of the superabundant

vitality of the earth should display any particular constancy in their appearance or any fixity of form. Consequently, to attempt to describe and classify the "Infusoria" must have seemed a futile task to many men of science 200 years ago.

In the latter half of the 18th century many minor contributions were made to protozoology, but no considerable advance was made until about 1830, when the Berlin zoologist, C. G. Ehrenberg (1795-1876), began to publish his researches. His chief contribution to protozoology was published in 1838—a monumental folio volume of more than 550 pages, accompanied by an atlas of 64 coloured plates. This is still one of the classics of the science. It contained much that was new and much that was true, everything of note that his industrious reading could find in the works of his predecessors, and withal a mass of mistakes to which he clung tenaciously—in spite of violent contradiction and criticism—to the end of his days.

Ehrenberg's most dangerous opponent was a Frenchman, Félix Dujardin (1801-60). In 1841, with an octavo volume of some 680 pages, but only 23 plates, he undermined the foundations of the big folio, and thus overthrew, for all time, many of the favourite theories of his German antagonist.

Since the time of Dujardin only one really exhaustive work on the Protozoa as a whole has been written. This is the great monograph by Otto Bütschli (1848-1920) of Heidelberg, published in 1880-9. It is significant of the vast modern development of protozoology that no work on a like scale, by a single individual, has since been produced.

*The Modern Science.*—Since the middle of the 19th century biological theory and practice have undergone profound changes; and in more recent years protozoology, with the rest of zoology, has largely changed its character. This period has seen—to note but a few of its more striking developments—the establishment of the theory of organic evolution, the rise of the cell theory, the foundation of histology and cytology, and the unfolding of physiology and embryology and medicine as experimental sciences. Protozoology has been profoundly influenced by all these new growths, and has itself contributed not a little to them. An attempt has been made, and has already been partly successful, first, to discover all the Protozoa there are, both living and fossil; then to investigate their structure in the minutest detail and to ascertain how they live and develop; and finally, to understand their relations to other organisms and their place in nature.

Before proceeding, we may note some of the peculiar difficulties which differentiate protozoology from the rest of zoology. The animals with which it deals are, speaking generally, invisible to the naked eye. Consequently, they cannot be studied and anatomised by ordinary methods. The protozoologist has first to become a master in the use of the microscope and to learn its limitations as an instrument of research. When he has become proficient he must learn or devise methods for catching, watching, breeding and preserving those Protozoa that he wishes to study, and must thus become familiar with a peculiar and varied technique adapted to the investigation of the lives and habits of animals invisible to the unaided eye. He must then acquire the power of correctly interpreting what he sees under these peculiar conditions. If he is an efficient microscopist and a good observer, endowed with abundant patience and ingenuity, and if, at the same time, he is a good zoologist and sound philosopher, then, with experience and diligence, he may hope some day to become a good protozoologist. From the very nature of the subject, therefore, it will be obvious that it is easier to make mistakes in protozoology than in most other branches of zoology; and there can be little doubt that the writings on the Protozoa, taken as a whole, contain a larger percentage of error than those on any other group of animals. Protozoology is, indeed, still in its infancy, and learning slowly and painfully by the method of making mistakes.

Protozoology, like most other sciences, is important from two different standpoints, which may be called the theoretical and the practical. On the theoretical side we have to consider its relations to the rest of zoology, and the value of its contributions to biological philosophy; on the other side, we must consider the utility of its practical applications, which are chiefly medical. In other words, we must look at protozoology as a pure science and as an applied science.

*The Pure Science.*—The theoretical importance of protozoology is not what it appeared towards the end of the 19th century. It has not fulfilled some of the high hopes then entertained for its future. In that earlier period the writer of an article such as this would have begun, in all probability, by declaring that the study of the Protozoa would lead to the

solution of most of the outstanding general problems of biology. He would have pointed out that these animals were of the greatest importance in connection with the two chief biological generalisations of his time—the cell theory and the evolution theory—and he would probably have ended by saying that a lack of detailed knowledge alone prevented protozoology from answering most of the fundamental questions of biology. Though we have now an abundance of the sort of information then regarded as requisite, yet the great problems are still, for the most part, where they were. It is both interesting and instructive to inquire how this has come about.

The cell theory was first definitely formulated, in Germany, by Schleiden (1838) and Schwann (1839), and was modelled into its modern form by Max Schultze (1861): that is to say, it took shape at the time of the reformation of protozoology by Ehrenberg and Dujardin, when the science was still feeling for a foothold. According to the cell doctrine, all organisms, both animals and plants, are built up of structural units, called "cells," in much the same way as a house is built of bricks (*see CYTOLOGY*). Schultze defined "a cell" as "a little lump of protoplasm with a nucleus inside it," and this definition was generally accepted. It should be noted that this proposition, so far as the larger animals and plants are concerned, is not a "theory" at all, but a statement of fact easily verifiable by means of the microscope. The body of a rabbit or a cabbage is, for the most part, actually composed of "cells" as conceived in the definition. The "theory" was introduced when the proposition was held to apply to all organisms at all stages in their development. Dujardin had shown that the Protozoa are soft-bodied animals composed of "sarcode"—the "protoplasm" of later workers—in which no constituent "cells" are discernible. Like "cells" Protozoa contain "nuclei," but unlike the large animals, they show no internal differentiation into cellular units. It was thus necessary to introduce some new conception if the cell theory was to become universally applicable.

The extension of the theory, so as to enable it to include the Protozoa, was made by von Siebold. Each individual protozoon, he said, is itself a "cell." It is comparable with a single one of the innumerable units of which the bodies of large animals are built. The Protozoa are "unicellular" animals, all others "multicellular." According to this doctrine, therefore, a protozoon is not comparable, as an individual, with a whole multicellular animal, but with one of the cells in its body: or, the other way about, a multicellular animal is not an individual of the same sort as a protozoon, but a colony of such individuals.

This conception appeared so plausible—owing, it must be supposed, to the backward state of protozoology and cytology at that date—that it found ready acceptance; and, in spite of the cogent objections which have been raised against it by Huxley (1853), Whitman (1893), Sedgwick (1894), Dobell (1911) and others, it has prevailed down to the present day.

When the cell theory was being founded, another great biological generalisation was just emerging, the doctrine of organic evolution (*q.v.*). Charles Darwin's great work, which appeared in 1859, created a revolution in biological thinking. Although Darwin's own work, and his statement of the theory, appear to be unexceptionable, the doctrine misnamed "Darwinism" developed along extravagant lines—chiefly, as is now evident, owing to the wild speculations and dominating influence of E. Haeckel and other German writers. The "cell theory" was immediately subpoenaed to give evidence for these "Darwinists." They wrongly believed that the evolution theory required the presence of some "most primitive" and "elementary" animals—from which all the "higher" forms had been derived—on the earth at the present day; and the shaky syllables let fall by the cell theory were eagerly seized upon, interpreted and ultimately incorporated as incontrovertible facts in the case of the "Evolutionists." "Unicellular" organisms, such as the Protozoa, thus became the starting-point of evolutionary speculations. The Protozoa were obviously the "simplest" animals, since less was known about them than about the others; and

they were clearly the "most elementary," each individual representing but one of the structural elements of which the others were composed. Their insignificant size made them the "lowest" forms on earth, and their position—according to the "theory"—at the bottom of the "*Scala Naturae*," made them the "most primitive." It thus became easy to show, by specious arguments and "question-begging epithets," that protozoology occupied a position of fundamental importance in biology. By studying the Protozoa the earliest stages in evolution would be revealed, the beginnings of life would be laid bare; while physiology and morphology, stripped of all confusing detail, would appear in their elemental forms. But it is now become clear that protozoology was placed in a false position by the devotees of the cell doctrine and the dogmatic evolutionists. Let us look at the fundamental conception of the "unicellularity" of the Protozoa from another angle, and see how it appears in the light of modern knowledge.

In the first place it is clear that the Protozoa cannot properly be described as "unicellular." Every protozoal animal has an independent existence. It has its own peculiar structure, exercises its own proper functions, leads its own life—often, indeed, a very complex one. As an animal it is, from every standpoint, as much an "individual" as a man is. One protozoan is one whole animal, just as one man is one whole animal. From the standpoint of common sense, no less than from that of modern zoology, the whole organism is the unit of individuality. But when we examine a protozoan under the microscope we still see—as Dujardin saw—that its body is not differentiated internally into cells, as is that of a man. Its body is often surprisingly complex in structure, but it is never composed of cells. It is clear, therefore, that we can contrast the body of a man with that of a protozoan by saying that the one is cellular in structure, the other *non-cellular*. To call it "unicellular" and thus compare one whole animal with a minute differentiated fraction of another, is obviously absurd. It is as though a man who had only seen houses built of bricks were suddenly to encounter one constructed, all of a piece, of concrete; and then, being unable to find the familiar individual bricks in its fabric, were to declare that the concrete house is not a house—in the sense that the brick house is—but one large and peculiarly modified brick.

When once it is realised that the Protozoa are not, in any sense, "elementary" or "unicellular" animals, but a group of peculiarly constructed creatures, adapted in a special way to particular conditions of life, then it will also be realised that we have no reasons—apart from preconceived ideas derived from unsound generalisations—for believing that they represent "primitive" or "first" forms of life. That they are not "simple" we now know. It is true that they display, on the whole, less visible structural differentiation than most of the larger animals; but physiologically they are very complex. That they are able to perform all the chief functions of "higher" animals, but with fewer instruments, does not make their mechanism easier to understand; and it is thus hardly conceivable that the Protozoa can ever offer us the easiest way of approach to physiological problems. They offer us, indeed, the most difficult field in animal physiology, owing to their microscopic size and apparent simplicity of structure.

As a point of historic interest, it may be noted that the Father of Protozoology and his immediate followers had none of the extravagant later notions regarding the "unicellular" and "elementary" nature of the Protozoa. For Leeuwenhoek the Protozoa were animals like any other animals, but delightfully and marvellously little; and he thus saw more clearly and naturally than many of his later successors.

There are probably few biologists who now cherish any hopes of seeing the fundamental problems of biology solved by the study of the Protozoa, though the majority still speak and write in the optimistic language of last century. For these mental survivals there is a psychological basis, which seems worth noting before we go on to consider the true status and value of protozoology. There is a curious disposition, apparently

inherent in the human mind, to suppose that by studying the most minute creatures we can come nearer to first principles. And it is the same with the study of the larger organisms. As the cytologist probes into the structure of an animal with higher and still higher powers of the microscope, he feels that he is gradually "getting to the bottom" of his problems. He feels that when his microscope has resolved the larger animals into their smallest component parts and has revealed every detail of the smallest living thing, he will be face to face with fundamentals. It does not require much thought to realise that this is a fallacy. The deeper we delve, the more detail we discover. But it is all of the same sort; we add to the quantity and not to the quality of our knowledge. With the highest possible magnification we shall obtain no information which is qualitatively or fundamentally different from that to be derived from the study of large organisms and their gross anatomy, with the naked eye.

The mental bias just mentioned seems to be responsible for many popular—and not a few "scientific"—notions about the Protozoa. It appears, for example, to be at the back of the unreasonable but common belief that the Protozoa are "elementary" and "primitive" animals. Although few biologists now believe in spontaneous generation, yet many are able to believe that living things must have been spontaneously generated from lifeless matter in the past; and to those who hold this belief it still appears self-evident that the organisms so generated were microscopic. Consequently, these biologists feel that the Protozoa must, in some way, be nearer than other animals to "the beginnings of life," and they find no difficulty in conceiving that the first animals were "Protozoa." In the same way, when these same biologists come to consider evolution, and the relations of living animals to one another, they find in the Protozoa the easiest starting-point for their speculations. The Protozoa are "the simplest" animals, and the human mind works most readily from simple to complex conceptions. Consequently, evolution is pictured as necessarily moving in the same direction—the simply constructed creatures coming first, and the complex developing from them. But it is surely a poor philosophy which would constrain Nature to order her infinite events in that particular sequence in which thoughts happen to follow one another most easily in the mind of man.

What, then, it may be asked, is the theoretical interest or value of protozoology? Clearly it is this. Biological theory is sound in proportion to the truth of its generalisations. When all the facts are known about all animals and plants, we shall be able to make true general propositions about them. Before we know the facts our generalisations can be but partial and premature—more or less lucky guesses, based upon incomplete knowledge. All biological theory is at present in this condition, and therefore the careful study of any animal or group of animals, such as the Protozoa, will, if it yields new facts for generalisation, be valuable ultimately as a contribution to biology. At present we cannot hope to do much more than collect facts, by means of accurate observation and apposite experiment. When we have collected and critically analysed them, we can sometimes make tentative generalisations of a lesser order. But the larger and truer generalisations will come later.

It may be said that if this is all that can be expected from protozoology, then it is no more important than any other branch of zoology: there is no reason why we should study the Protozoa rather than any other group of animals. All this is true and reasonable; but there is also a reason why protozoology is likely to yield results of particular interest. The Protozoa are a group of animals organised on a different principle from the rest. They are, as we have just seen, non-cellular animals with peculiar lives and habits. Structurally and functionally they differ, in many ways, from all other animals. Now all the chief biological generalisations—almost all general propositions relating to such phenomena as birth, growth, development, sex, reproduction, heredity, variation and death—have been derived from observations made upon the larger multicellular animals. When general ideas were formulated on such subjects the Protozoa were practically left out of account. When the more important facts about the Protozoa are firmly established, we shall be able to recast many of our biological theorems in

a more satisfactory form. The Protozoa offer us, in other words, a new world of animals for generalisation, and a new standpoint from which to survey our old-world zoological knowledge.

*The Applied Science.*—The chief practical applications of protozoology are to medicine. Certain of the Protozoa live as parasites in the bodies of men and animals and thereby cause diseases. Some of these are so important that they are widely known—for example, malaria and sleeping sickness—and the elucidation of such diseases is one of the most interesting and recent chapters in biology (see PARASITOLOGY).

The founder of protozoology was the first to find Protozoa inhabiting the living bodies of other and larger animals. In 1681 he described one such "animalcule" which was living in his own intestine. In 1683 he described and depicted others from the intestine of the frog. All these are recognisable, with fair certainty, at the present day. Leeuwenhoek did not suggest that these "parasites" were in any way concerned in the causation of disease and it is probable, indeed, that the forms which he observed are not. But already at that date the "microbe" theory of disease-production was in existence, for it was guessed at long before any "microbes" were discovered; and consequently we find that, even in Leeuwenhoek's lifetime, the suggestion was put forward that his "little animals" might be the "causes" of certain disorders. We find, for example, an early fellow of the Royal Society remarking, in 1683, of a "murren" which had raged among cattle in central Europe, and of which the cause was undiscovered: "I wish Mr. Leeuwenhoek had been present at some of the dissections of these infected animals. I am persuaded he would have discovered some strange insect or other in them." Mr. Leeuwenhoek's successors have, on many a like occasion, fulfilled the expectations of "the ingenious Fred. Slare, M.D., and F.R.S.," but his "strange insects" they now call "Protozoa" or "Bacteria."

Our knowledge of protozoal diseases—diseases colloquially said to be "caused" by protozoal parasites—really begins as recently as the middle of the 19th century, when Louis Pasteur (1822-95) began his researches on a disease of silkworms called *pébrine*. Applying to the investigation of this disease the genius which stamps his work on "microbes" generally, Pasteur first discovered its causes and then deduced methods for its prevention. The "cause" he found to be a microscopic parasite, now called *Nosema bombycis* and classified among the Protozoa. Although Pasteur did not know that the parasite was a protozoon, his work on *pébrine* and other microbic diseases was of fundamental importance for protozoology, because it demonstrated the methods by which such diseases can be studied and elucidated. It is common knowledge that Pasteur founded modern bacteriology; but in so doing he also laid the foundations of medical protozoology.

To the casual reader it may seem strange that the study of silkworms can have any bearing upon medicine, or could in any way contribute toward the alleviation of human suffering. But there was another practical result of Pasteur's work which everyone will immediately appreciate, since it can be expressed in pounds, shillings and pence. Before *pébrine* attacked the silkworms of France the silk industry yielded an annual revenue of 130,000,000 francs to the state. After the disease had raged for a dozen years the revenue had fallen to 8,000,000 and the industry was on the brink of ruin. To have discovered the causes of the disease and to have devised, as a direct consequence, means for its control, and, as a further consequence of this, to have rehabilitated the whole silk industry—these are practical results which everyone can understand. One has but to remember that protozoal diseases may affect man himself and his larger domesticated animals, not merely silkworms, to realise the practical possibilities of protozoology.

Toward the close of the 19th century medical protozoology became linked up with another branch of zoology—entomology, the science which deals with insects (see ENTOMOLOGY, MEDICAL). This connection has nothing to do with the silkworms just mentioned, but arose through the discovery of the part played by certain other insects in the causation of protozoal diseases. The discoveries in this field began, once more, with the investigation of a disease of domesticated animals; but the pioneer was not, in this case, the Frenchman Pasteur, but the Scotsman David Bruce. His work is of such importance that we must notice it at this point.

*The Work of Bruce.*—Some parts of Africa are the home of certain large blood-sucking flies called "tsetse." The "Fly Country" is uninhabitable except for wild animals; and long

before its full significance was understood, the fly itself was recognised as a serious obstacle to the opening-up of Central Africa. Livingstone, the greatest of all African explorers, was so impressed with the fly's importance in this connection that he put a vignette of a tsetse on the title-page of his *Missionary Travels* (1st ed., 1857). Livestock taken into the "Fly Country" rapidly succumbs to a disease which is called "nagana" in Zululand, where Bruce's original investigations were made. The disease was also called "tsetse-fly disease," since it was believed by the European settlers to be caused by the bite of the fly. The natives believed, however, that it was "caused" by the presence of large game, the wild animals in some way contaminating the grass or drinking water."

Bruce began his work in Zululand—after an abortive attempt in 1894—in September 1895 (the month of Pasteur's death). His full report on his researches is dated May 1896. In this almost incredibly short space of time he demonstrated that nagana is caused by a protozoal blood-parasite—since named *Trypanosoma brucei*, after its discoverer; that the parasite lives normally in the blood of big game, without harming them; and that it is conveyed from animal to animal by the tsetse. When the fly sucks the blood of an infected animal it becomes itself infected with the trypanosomes, which are subsequently re-inoculated into other animals by the fly when it sucks their blood. If these other animals are domestic stock, such as oxen or horses, they become infected with trypanosomes, contract nagana and die. If they are wild game, such as antelopes, they also become infected, but develop no disease. In nature the trypanosome lives in the game and the flies alternately, the fly acting as an intermediary in the spread of infection from antelope to antelope.

Bruce thus succeeded in extracting the elements of truth from both the European and the native beliefs, and was able to combine them into a true theory of the causation of nagana. At the same time he threw a flood of light on many other protozoal diseases, and suggested all sorts of possibilities concerning their causation and prevention. He forged new links between protozoology and medicine and between entomology and protozoology. It is true there were other lights and other links before. Trypanosomes were known, and known to cause diseases, before Bruce went to Zululand. Two Welshmen, Timothy Lewis and Griffith Evans, had observed similar parasites in India more than a decade earlier; and two Americans, Theobald Smith and Kilborne, had demonstrated in 1893 that the disease of cattle known as "Texas fever"—a disease also caused by a blood-inhabiting protozoal parasite—is transmitted from beast to beast by the agency of ticks. But Bruce's work was solid, complete and demonstrative. By clean experiments and right reasoning he contributed more to science in a few months than hundreds who have followed up his work have since been able to contribute in many years.

The following-up of Bruce's discoveries and the working-out of details and consequences have led to the accumulation of an immense amount of new knowledge—protozoological, entomological and medical. We can do no more than mention it here. We must, however, notice one of the first fruits of his labours—the application of his results to the study of human diseases. This application was made mainly by Bruce himself. A few years after he had done his great work on nagana he attacked the problem of sleeping sickness, a human disease which has depopulated large areas of Central Africa. Bruce and his collaborators were able to show that this disease is similar to nagana. It is likewise caused by a trypanosome, which is conveyed to man by the bite of a tsetse-fly, and which is capable of living in other animals. In this case the parasite had been previously seen by Forde and Dutton and by Castellani. But its relation to human disease, and the part played by the tsetse in its transmission, were first clearly demonstrated through the work of Bruce. (See PARASITOLOGY; SLEEPING SICKNESS.)

*Malaria and Other Diseases.*—We must now notice another disease, which is known by name to all—malaria, "the scourge of the tropics." This disease, as we now know, is also carried from

man to man by the agency of a blood-sucking fly—in this case a mosquito; and it is also caused by a blood-inhabiting protozoal parasite, though it is one very different from that which causes nagana. Moreover, this parasite lives in men and mosquitoes only. After undergoing a peculiar development in the blood of a human being, it is sucked up with his blood by a mosquito when it feeds upon him. Provided that the mosquito is of the right sort, the parasites in the blood—if they are in the proper stage of development—undergo further remarkable changes in the mosquito's body. Thereafter the mosquito is able to infect other men with the parasites, which it injects into their blood in the process of sucking. And so the life of the parasite continues.

The foregoing is the briefest synopsis of a very complicated story, in which almost every event has been worked out in great detail. Hundreds have contributed to this work, though some of them can hardly be said to have co-operated in it. Indeed, such bitter fights have taken place among them that it has now become almost impossible to mention the names of some workers without offending others. Fortunately, however, the names of the leading discoverers are now known to almost everybody, and their individual achievements are no longer in dispute. Even the "general reader" is familiar with the name of Laveran (1845-1922), the great Frenchman who, in 1880, discovered the malarial parasites in human blood; of Patrick Manson (1844-1922), the founder of modern tropical medicine, who divined, in 1894, the part played by the mosquito; of Ronald Ross, who, inspired by Manson, first worked out in 1898 the complete development of the malarial parasite of birds; and of Grassi (1854-1925), and his fellow-workers in Italy, who immediately confirmed Ross's work and extended and successfully applied his results to the study of malaria in man. When the 19th century ended the story was almost complete. (See MALARIA.)

It will be evident that malaria, nagana and similar diseases are not purely protozoological problems. It will also be obvious that such diseases might be prevented by attacking either the protozoal parasites which "cause" them, or the insects which transmit them, though there could have been but little hope of success in coping with such diseases before the life-histories of the parasites were discovered. The practical importance of protozoology in cases such as these is self-evident. The facts speak for themselves.

Malaria is a far commoner disease than nagana, and the discoveries relating to it have therefore made a far wider appeal to the public. It intrigues the public to hear that there would still be no Panama Canal but for the great discoveries in connection with malaria. It would excite them but little to hear that some obscure tribe of Zulus could now keep cattle in places where it was previously impossible. But the advancement of science is not measured in such terms, and science values most highly those who discover and enunciate new principles. Already we can observe that the problems presented by nagana and malaria are similar, and that most of the generalisations which their solution can give us are, indeed, the same. We can see, too, that history, in the end, is generally just. Consequently, we may hazard a guess that in years to come the historian of science, in his impartial search for beginnings and great names, will not fail to note the sequence of the discoveries which we have just considered, and will apportion his praise accordingly.

*The War Period.*—Medical protozoology, like many another branch of science, received a powerful stimulus from the War of 1914-8. Not only was much of the previously acquired knowledge put into practice, but this practical application in turn revealed or emphasised the gaps, defects and errors in many current conceptions, and so led ultimately to the prosecution of new researches and the acquisition of much new knowledge. Surveyed from the most general standpoint, the War appears to have taught us little that was new regarding malaria and the other protozoal diseases already mentioned. Its chief protozoological contribution has been to our knowledge of those Protozoa which live in the human intestine, and more especially to the elucidation of the disease called amoebic dysentery. We may therefore say a few words on this subject at this point. (See DYSENTERY.)

The Protozoa known as amoebae form a large and interesting group. Most of the species live independently in such places as ponds, ditches or the soil; but some of them live in the bodies of other animals, and one of them—called *Entamoeba histolytica*—was already known before the War to live in the human bowel and "cause" amoebic dysentery.

This parasite was first described by Lösch in Russia as long ago as 1875. Its real relation to dysentery, however, was not made clear, though much debated, until just before the War, when the admirable researches of two American workers in the Philippine Is.—E. L. Walker and A. W. Sellards—were published. During the War their results were confirmed and greatly extended, chiefly by the investigations of British workers. As a consequence, we now know as much about amoebic dysentery as we do about malaria or the diseases due to trypanosomes.

No less than five different species of amoebae may live in the intestine of man, though only one of these—the "dysentery amoeba" already mentioned—ever does him any harm. Moreover, amoebic dysentery is a comparatively rare disease. There are many different kinds of dysentery, and the kind due to amoebae is far from being the commonest. Before the War amoebic dysentery was generally recognised as a disease more or less restricted to the tropics, though certain other kinds of dysentery occur all over the world. The curious fact brought into prominence by the War is that the dysentery amoeba itself is very common almost everywhere. This parasite, which can cause, by its presence in the bowel, a violent and sometimes fatal form of dysentery, usually does no such thing. Very many people in all parts of the world are infected with it, but very few ever suffer any appreciable harm from its presence. The parasite and the person who harbours it are usually suited to one another in such a way that they can live together comfortably, oblivious of the existence of one another. There are, for instance, in the British Is. at this moment at least 2,000,000 people who are infected with these potentially disease-producing parasites, and yet enjoying perfect health.

Another curious feature of amoebic dysentery is the circumstance that the disease cannot be contracted from a person suffering from it. The people responsible for the spread of infection are those who harbour the parasite but themselves suffer no ill consequences from its presence. The explanation of these seemingly contradictory facts is really quite simple, now that we know the life-history of the amoeba and its relation to disease. It is a popular fallacy to suppose that any parasite is the sole "cause" of any disease. A disease is a joint result of many antecedent factors, and in the present case it would probably be nearer the truth to say that the person who harbours the amoeba, rather than the amoeba itself, is the "cause" of amoebic dysentery. For dysentery results only when the infected person happens to be abnormally sensitive to infection with the amoeba, and the condition is as harmful to the parasite as it is to the patient. Normally man and amoeba fit one another, and there is no trouble. Abnormally there is a misfit, and amoebic dysentery is the consequence.

The foregoing considerations will serve to show once more the value of protozoology in the study of human diseases. What hope could there ever be of eradicating a disease such as amoebic dysentery if we remained in ignorance of the life-history of the parasites connected with it? We might cure every case of the disease—we might conceivably prevent the death of every patient who contracted it; but even if we did, it is now clear that this would have no effect whatever upon the continuance and prevalence of the disease itself.

It has been supposed for so long that the parasites which produce protozoal diseases are peculiar to tropical or sub-tropical countries that the discovery of the dysentery amoeba in Britain may seem surprising. It is really not so surprising as the circumstance that nobody, until quite recently, had thought of looking for it here. And there are many equally remarkable parallels. To mention only those diseases and parasites which we have already noted, we can now say that malaria occurs indigenously in Britain—though this was hardly suspected until recently; and that parasites closely similar to those which cause nagana and Texas fever have now been discovered in British sheep and cattle. How far these observations are of practical importance the future will show, but already they clearly indicate that medical and veterinary protozoology may be studied with profit at home no less than abroad. This, in fact, is being done to a very large extent.

REFERENCES.—The literature relating to Protozoology is so vast that it is impossible to give adequate references in a few lines. The works listed below are therefore merely a selection of the more important memoirs referred to in the preceding article, together with a few others likely to be of service to the reader desirous of pursuing the subject further. Of recent monographs dealing with the Protozoa as a whole the most trustworthy are those of Doflein (1916) and Minchin (1912), both of which contain copious bibliographies.

**PROUST, MARCEL** (1871-1922), French man of letters, was born in Paris on July 10 1871. His father was a professor of medicine, and his mother was of Jewish extraction. He was educated at the lycée Condorcet, and about 1892 he was for some time associated with Léon Blum, Louis Mirhfeld and Tristan Bernard on the *Revue Blanche*, a periodical conducted by a select group of intellectuals, mostly Jewish. Becoming a favourite in the salons—especially those of Mme. de Caillavet and Madeliene Lemaire—he wrote a number of society love-stories (collected in 1896 under the title *Les plaisirs et les jours*) distinguished by their psychological subtlety. He also attained reputation as a clever writer of *pastiches*. He became an enthusiastic admirer of John Ruskin and translated several of his works into French, including the *Bible of Amiens*, to which he contributed a valuable preface.

In 1902 Proust's health began to fail. Thenceforward he was reluctantly obliged to lead an extremely retired and careful life, and for many years it looked as if he had altogether abandoned literature, in which his name hitherto had not been known outside a small circle of friends. He was reading and writing a great deal, however. The interminable discursiveness of Ruskin, which French readers do not suffer gladly, was to him a constant source of delight, and Saint-Simon, ever one of his favourite authors, exerted a powerful influence upon him at this time. Thus it came about that, having unlimited time at his disposal, he embarked upon a long and leisurely work, full of minute detail, in which was imprisoned, as in a net, his whole experience of life; in which the *salon* life he loved was revived in all its details and observances like the court life in Saint-Simon's memoirs; in which the people he had known provided the materials for new, fuller and richer characters (M. de Charlus, for example, is a blending of three different people of Proust's acquaintance), and in which the author sought out and lived the past over again. Hence the general title given to the 15 volumes of the series, *A la recherche du temps perdu* (1913, etc.).

This lengthy work had almost been completed when Proust published the first part, *Du côté de chez Swann*, in 1913. The freshness and minuteness of the recollections of childhood

attracted some attention, but none the less Proust, who had had to publish the first part at his own expense, had difficulty in finding a publisher for the second, *L'ombre des jeunes filles en fleurs*. When it did appear its qualities were at once appreciated by Léon Daudet, whose enthusiastic articles, followed by the award of the Prix Goncourt in 1918, brought Proust's name prominently before the public, and he was read, discussed and criticised everywhere. Two more parts appeared during Proust's lifetime—*Le côté de Guermantes* and *Sodome et Gomorrhe*, both in 1921. When he died in Paris, Nov. 18 1922, he left three parts still in manuscript—*La prisonnière*, published in 1924, *Albertine Disparue* (1926) and *Le temps retrouvé* (1926).

Proust's influence, especially since his death, has been considerable. He introduced into the novel an analytic method which has a superficial resemblance to that of Meredith, but is more properly comparable with that of Freud. That the name and notion of time should appear in the general title of his great work is not without significance. By a curious coincidence he was related by marriage to Bergson, the philosopher of "creative time," and the term "creative time," aptly describes the psychological time which Proust explores, seeks and recovers. His people are never given as "characters" in the fashion of La Bruyère or Balzac; they are always in process of development, change and continual creation.

Part of Proust's success was due to the very thing that is likely to tell against his lasting reputation, viz.: the fact that his characters, beginning with the "I" of the book, are exceptional, an erotic and mysterious group having little in common with the generality of mankind. This is true not only of *Sodome et Gomorrhe* and Proust's emphasis upon homosexuality, but also of the idle life and ultimate nothingness of the people of his world, their lack of all interests other than those of social life, and the indifference that the ordinary reader must always feel as to their fate. On the other hand, there will be a taste for Proust so long as there is a taste for psychology as an end in itself, and so long as the play of memory, the searching and brooding that pertain to the conquest of the past, afford to some men a sufficient reason for living or a romantic manner of not living. The following translations by R. Scott Moncrieff appeared in English: *Swann's Way* (1922); *Within a Budding Grove* (1924); *The Guermantes Way* (1925).

See *Marcel Proust, an English tribute*, collected by C. K. Scott Moncrieff (1923); "Hommage à Marcel Proust, 1871-1922," *La Nouvelle Revue Française*, No. 112 (1923); L. Pierre-Quint, *Marcel Proust: sa vie, son oeuvre* (1925). (A. Th.)

**PROVIDENCE, R.I., U.S.A.** (see 22.510), increased in population only 5.9% in the decade after 1910, and 12.8% in the five years 1920-5. The figure for 1920 was 237,595 which included 5,655 negroes and 69,895 foreign born; for 1925 (state census), 267,918. Its varied and important factory products were valued at \$120,241,000 in 1909; \$267,629,000 in 1919; \$170,116,661 in the year of depression, 1921; \$215,654,286 in 1923, when there were 890 establishments, employing 45,495 wage-earners. Extensive harbour improvements were initiated in 1918, in co-operation with the state and Federal governments. The water supply was increased by the construction of the Scituate reservoir. A zoning ordinance was adopted in 1923. Providence has a relatively high amount of child labour (11.7% of all children between 10 and 15 years of age being wage-earners in 1920). Providence College, a Roman Catholic institution, was established in 1917, and had 517 students in 1925. Brown University had 2,013 on the register in 1924-5, including 428 in the women's college.

**PRUSSIA** (see 22.518), a free state and territory of the German Reich (Freistaat Preussen). The area is 113,833 sq. m. and the population (1925) 38,750,000; these figures include the Prussian part of the Saar district with estimated population.

*Political History 1910-25.*—Up to 1918 Prussia was a federated State of the German Reich (since 1871) and a monarchy, with constitution dating from Jan. 31 1850. The King of Prussia was also German Emperor. The reigning dynasty was the Hohenzollern. The people were represented through two

Chambers: the Upper House (Herren Haus) composed of members whose seats were hereditary and others appointed by the King for life; and the Lower House (Haus der Abgeordneten) composed of members elected by direct voting according to the "three-class system" (see 22.521). The principal political agitation before and during the War centred round the abolition of this undemocratic electoral system, which was loudly demanded by the mass of voters and promised, but not granted, by the King at Easter 1917.

On Nov. 9 1918 the King abdicated; on Nov. 10 the monarchy was abolished and the Republican form of State proclaimed. The power rested at first with the Workmen's and Soldiers' Councils: the executive authority was exercised by a plenary council, under whose orders a provisional government took over the conduct of the Prussian Government. During this period there was no popular representation; the lower house had been dissolved, the upper house abolished. On Jan. 26 1919 the elections to the constituent Prussian Assembly were held; on March 5 the Assembly met. The final constitution was perfected on Nov. 30 1920. Meanwhile, Prussia's relations to the new republic of the German Reich had been regulated by the constitution of the German Reich of Aug. 11 1919 (see GERMANY: CONSTITUTION) which had put an end to the dominating position which Prussia had enjoyed in the German Federation, partly through the position of her King as German Emperor. If Prussia predominates in the German Reich to-day, this is due to her size and the fact that she has successfully preserved her unity.

*Constitution and Administration.*—The constitution of the Prussian Free State includes 11 sections: the State, the executive power, the Landtag (Diet), the State Council, the Ministry of State, the legislative power, finance, self-administration, religious orders, state officials and temporary and final provisions. The section "State" declares that Prussia is a republic and a member of the German Reich. The national colours remain black and white. The authority of the State rests in the people as a whole. It can enunciate its will directly by referendum, or indirectly through the constitutionally appointed organs. The franchise is general, equal, secret and direct. The Diet is the supreme organ of legislation, subject to the people's right of direct "popular initiative" or "popular decision." The Diet has the right to decree legislation. It consists of deputies of the Prussian people, elected for four years. After the elections of Dec. 7 1924 there were 450 deputies (114 Social Democrats, 109 German Nationalists, 81 Centre, 45 People's party, 44 Communists, 27 Democrats, 17 Economic party, 11 National Socialists and 2 Poles), the President being a Social Democrat, Bantels.

The Council of State (Staatsrat) exists to approve or to raise objections to the decisions of the Landtag. It consists of representatives of the provinces, elected from the provincial Diets. New elections are held after the new elections of the individual provincial Diets. In 1925 the Council of State consisted of 77 members: its President was Dr. Adenauer, Oberbürgermeister of Cologne. The Ministry of State is a supreme executive and directing organ of the State. It consists of the Minister President, who is elected by the Landtag, and the Ministers of State, whom he then nominates. The Ministry of State consisted in 1925 of Braun (Social Democrat), Minister President; Dr. A. M. Zehnhoff (Centre), Minister of Justice; Severing (Social Democrat), Minister of the Interior; Hirtsiefer (Centre), Minister for Popular Welfare; Dr. Becker (non-party), Minister of Science, Art and Education; Dr. Hopker Aschoff (Democrat), Minister of Finance; Dr. Schreiber (Democrat), Minister of Trade and Industry; Steiger (Centre), Minister of Agriculture, State Domains and Forests.

The principles of the administrative organisation were not changed by the revolution. Prussia is divided into 13 provinces (formerly 14), each under an Ober-Präsident: East Prussia, Brandenburg, Pomerania, Berlin City, the Posen March (West Prussia), Lower Silesia, Upper Silesia, Prussian Saxony, Schleswig Holstein, Hanover, Westphalia, the Rhenish Province, and Hessen Nassau. Each province, except Berlin City, is divided into districts, each under a "Regierungspräsident" and these again into cantons, urban cantons and rural cantons, each under a Landrat. The rural cantons are at the same time communal organisations. The Landrat controls the country communes and districts. The urban communes are directly under the Regierungspräsident.

*Area and Population.*—Under the Treaty of Versailles, Prussia ceded: to Lithuania (Memel District) 2,656 sq. km., with 141,238 persons (Census of 1910); to Poland, 46,142 sq. km., with 3,854,971 persons; to Czechoslovakia, 316 sq. km., with 48,446 persons; to Denmark, 3,993 sq. km., with 166,348 persons; to Belgium, 1,036 sq. km., with 60,003 persons; to the Free State of Danzig, 1,914 sq. km., with 330,630 persons; or 56,058 sq. km. in all. In some cases these cessions were preceded by plebiscites. They affected nine

provinces: the heaviest losses were incurred by Posen, Westphalia and Upper Silesia. East Prussia was separated from the mother country by the creation of the so-called Polish Corridor as an addit to Danzig. On April 1 1922 Pymont (65.6 sq. km., 10,443 inhabitants) was incorporated in Prussia (see RHINELAND; RUHR; SAAR).

At one time (1920) 27,572 sq. km. of Prussian territory with over 8,500,000 inhabitants, were occupied. The demilitarised Prussian territory on the Rhine consists of 32,487 sq. km. with nearly 10,000,000 inhabitants. The territorial provisions of the Treaty of Versailles, therefore, affect in all almost 90,000 sq. km. of Prussian soil, with over 14,000,000 inhabitants. The population of Prussia was 36,700,000 in 1919, but at the census of June 16 1925 had reached 38,180,000; including the Saar district, about 38,750,000. The surplus of births over deaths fell from 552,961 (1913) to 400,348 (1920); 438,778 (1921); 324,633 (1922); 270,036 (1923); 324,533 (1924). In the first half of 1925 it was 187,841. Even taking into account the diminution of territory, these figures show a considerable reduction in the natural increase of population. This surplus of births was due solely to a great reduction in the death-rate, for the birth-rate itself has fallen heavily and steadily since 1913. Emigration has been exactly balanced by repatriation and immigration.

The losses of territory were most important for Prussia from the economic point of view. In Upper Silesia, Prussia lost one of her most valuable industrial districts; and in the Provinces of Posen and West Prussia, the districts which produced the largest agricultural surplus. In 1913 the part of Upper Silesia which is now Polish produced 33,100,000 tons of coal, 440,000 tons of zinc (68 % of the entire German production of zinc); the blast furnaces of Upper Silesia produced 500,000 tons of pig iron; the smelting works delivered 1,000,000 tons of steel; and the rolling mills manufactured 900,000 tons of finished goods.

*Agriculture and Industry.*—Prussia's economic character has not, however, been essentially changed. Large districts in East and North Prussia are still preponderantly agricultural, equally large districts in West and Southwest Prussia are exclusively industrial. On the whole, however, the industrial character preponderates. East Prussia, Silesia, Pomerania, the Posen March, West Prussia and Hanover are mainly agricultural. The whole area under cultivation in Prussia (plough, meadow, pasture and vineyards) was 18,200,000 hectares in 1925.

The predominantly industrial districts of Prussia are Brandenburg, Upper Silesia, Saxony, Westphalia, the Rhineland and parts of Hanover and Hessen Nassau. There are no exact data about the distribution of the various branches of industry within Prussia and in the different provinces. The results of the census of occupations and undertakings have not yet been published. According to the last census of occupations but one, 1907, the undertakings were distributed as follows:—

#### Occupations

|                                         | Under-takings | Subsidiary Establishments | Persons Employed |
|-----------------------------------------|---------------|---------------------------|------------------|
| Gardens, livestock and fisheries        | 31,413        | 5,333                     | 90,452           |
| Industry, including mining and building | 1,034,359     | 81,681                    | 5,870,991        |
| Trade and transport, including hotels   | 678,724       | 192,938                   | 1,794,349        |
| Music, theatres and exhibitions         | 13,779        | 2,201                     | 50,596           |
|                                         | 1,758,275     | 282,153                   | 7,806,388        |

The most important branches of industry are represented as follows:—

#### Industrial Establishments

|                                    | Main Undertakings | Subsidiary Establishments | Persons Employed |
|------------------------------------|-------------------|---------------------------|------------------|
| Mining, blast furnaces, salt mines | 3,721             | 565                       | 673,315          |
| Quarries                           | 21,073            | 1,420                     | 412,916          |
| Metal working                      | 80,518            | 5,957                     | 544,565          |
| Machinery and instruments          | 45,155            | 5,696                     | 625,945          |
| Chemical industry                  | 5,448             | 183                       | 101,430          |
| Lighting industry                  | 2,951             | 417                       | 53,316           |
| Textile industry                   | 44,375            | 4,246                     | 437,029          |
| Paper industry                     | 8,454             | 686                       | 106,501          |
| Leather industry                   | 24,832            | 1,616                     | 107,142          |
| Wood and carving                   | 96,455            | 11,944                    | 375,841          |
| Foodstuffs                         | 156,805           | 18,034                    | 642,488          |
| Clothing                           | 362,013           | 16,637                    | 704,178          |
| Cleaning                           | 63,237            | 4,270                     | 134,347          |
| Building                           | 104,204           | 9,150                     | 832,547          |
| Printing, etc.                     | 9,776             | 585                       | 105,164          |
| Arts and crafts                    | 282               | 275                       | 14,267           |

Since the middle of 1924, all industry alike passed through a process of contraction, which adapted the apparatus of production and distribution, which was swollen during the period of the War and the currency inflation, to the reduced needs of the world market.

**Natural Resources.**—The importance of Prussia's industry as a whole is chiefly based on Prussia's own natural resources, coal, iron and potash. Prussia has the richest deposits of any country of the German Reich. The most valuable coal-fields, the Ruhr district and Upper Silesia, are entirely Prussian, the Saar district partly so. The richest lignite fields, those of Central Germany, the East Elbe and the Rhine are mostly Prussian. The most important iron ore districts are in Peine and Salzgitter and in Siegerland, also in Prussia. The potash fields are mostly confined to Central Germany in the North and South of the Harz, the districts of Fulda and Werra in the Province of Hanover, principally Prussian districts. The refining industry is closely connected industrially and territorially with the production of raw materials. (See also GERMANY.) (W. GR.)

**PRYOR, ROGER ATKINSON** (1828-1919), American jurist and politician (see 22.533), died in New York City March 14 1919. In 1912 he published a volume of *Essays and Addresses*.

**PRZEMYŚL, SIEGES OF.**—The Galician town of Przemyśl on the San was first fortified in 1854, when war between Russia and Austria appeared imminent. The line of the rivers San and Dniester is the first natural barrier to a Russian invasion of Galicia, so that the fortification of the principal crossings seemed a wise precaution.

**State of the Fortress.**—In 1914 the town was protected by a ring of forts 36 m. in circumference. Some of the forts were of recent construction, but the fortress as a whole was not strictly up-to-date. The history of fortresses in the World War shows, however, that an exaggerated importance had been attached to works of concrete and steel, and that improvised field fortifications were almost equally effective in resisting assault. To clear the foreground in front of the fortified line no fewer than 18 villages and some 5 m. of forest were levelled to the ground on mobilisation. The armament of the fortress included four large modern howitzers of about 12 in. calibre and some 9 in. and 6 in. howitzers of older pattern. There were in all about 1,000 guns in the fortress, but more than half of these were old, short-range weapons of little value except for close defence. There were 114 machine guns, of which two-thirds were mobile.

The eventual garrison left in the fortress when the Austrian armies retreated from the San on Sept. 18 1914 consisted of: 61½ battalions (of which 40½ were Landsturm), 7 squadrons, 4 field batteries, 43 fortress artillery companies, 48 Landsturm artillery brigades, 8 sapper companies, and various technical and administrative units. The total strength was approximately 130,000 men and 21,000 horses. Provisions were available for three months.

**The First Siege.**—The Austrian armies withdrew from the San on Sept. 18; by Sept. 24 the investment of the fortress was complete. On the southwest front Kusmanek held a line a mile or two in advance of the ring of forts, elsewhere the line of the forts was held. The siege of the fortress was undertaken by Radko Dimitriev's III. Army. While the arrival of the siege artillery material was still delayed by the state of the communications, the Austrians renewed the offensive in the early days of Oct. (see VISTULA-SAN, BATTLES OF THE). In the hope of capturing Przemyśl by a *coup de main* before the progress of the enemy offensive compelled the raising of the siege, Radko-Dimitriev carried out several violent assaults between Oct. 5-8 against the Siedliska group of works to the southeast of the town. These assaults broke down with heavy loss, and the approach of the Austrian III. Army necessitated the withdrawal of the investing forces. The fortress was entered by Austrian infantry of the field armies on Oct. 11, on which date Radko-Dimitriev's III. Army retreated to the east bank of the San.

**Period Between the First and Second Sieges.**—During the Austrian attempts to force the San line, which lasted throughout Oct., the fortress lay in the centre of the battle line and its garrison took an active part in the operations. Its reserves of supplies and material were also largely drawn on by the field armies to make good the deficiencies caused by the poor working of the lines of communication. During their retreat the Russians had

systematically destroyed the railways and bridges, and the continued wet weather had rendered the roads almost impassable. Thus it was natural that the reserves of Przemyśl should be used for the benefit of the field armies, from whose operations great results were expected at the time. But when the offensive proved fruitless and Russian pressure necessitated a retirement which would leave the fortress again isolated, special efforts were made hastily to reprovision it. They were so far successful that the fortress was enabled to hold out for 4½ months in the second siege.

**Second Siege, Nov. 6 1914-March 22 1915.**—The strength of the garrison was approximately the same as in the first siege,

but a detachment of aeroplanes had been added. Kusmanek had now laid out new entrenched positions from one to two miles in advance of the line of forts, to give more depth to the defence and to keep the Russian siege artillery at a greater distance. On Nov. 9 the investment of the fortress for the second time was complete. The siege was now undertaken by a specially formed XI. Army under Gen. Selivanov, consisting of four divisions of second-line troops. It had been decided to reduce the fortress by blockade rather than by assault. During Nov. and Dec. such fighting as occurred was initiated rather by the sorties of the garrison than by the attacks of the besiegers.

During Feb. and the first half of March the Austrian field armies made repeated efforts to advance to the relief of the fortress, but unsuccessfully (see CARPATHIANS, BATTLES OF THE). Meanwhile the Russians had gradually closed in and had commenced a systematic bombardment of the fortress. On March 13 they carried the advanced positions on its north front. Kusmanek's situation was now desperate; his supplies and munitions were almost exhausted, and the final effort of the field armies to come to his rescue had definitely been abandoned. He determined on an attempt to save a portion of the garrison by a break-through to the east. The effort was made on the morning of the 19th, but was soon brought to a stand. The fate of the fortress was now sealed. On the morning of March 22 Kusmanek surrendered, after destroying the works and military stores as far as possible. The numbers of the garrison then amounted to about 110,000.

**Recapture of the Fortress.**—The Russians did not hold the fortress for long. At the beginning of May Mackensen's offen-

sive on the Dunajec broke through the Russian line and drove their armies back to the San (see DUNAJEC-SAN). On May 30 the Austrians attacked on the southwest and the Germans on the north of the fortress. The former made little progress, but the German heavy artillery, which included 42 cm. howitzers, made short work of the northern group of forts. On the night of June 2 the Russians abandoned the fortress.

**Conclusions.**—Przemysl was the only land fortress of the World War which stood a prolonged siege after complete investment. No conclusions as to the value of permanent fortifications in modern war can, however, be drawn from this fact. Gen. Townshend in Kut held out for longer behind hasty field entrenchments. The length of Przemysl's resistance was due to the Russians' lack of efficient siege artillery, as is proved by the speed with which Mackensen's heavy guns reduced the forts at the time of its recapture. Nor can it be admitted that the fortress served any strategical aim commensurate with the efforts expended on its defence and attempted relief. It is true that its resistance during the first siege was of value to the Austrians when their armies again advanced to the San, in assuring to them a bridge-head over the river. But during the second siege Przemysl was an embarrassment rather than a source of strength and led to several ill-considered efforts at relief which cost the Austrian field armies dearly. The fortress did not control any line of supply vital to the Russian armies operating west of it towards Cracow, since there was a railway available through Jarostow. The Russians could therefore afford in the second siege to resort to a simple blockade by second-line troops, so that the fortress did not even weaken their field armies to any appreciable extent. On the whole then, Przemysl may be considered no exception to the general experience of the World War, that permanent peace fortifications proved of very limited strategical value.

**PSYCHIATRY**, a special branch of medical science dealing with the causes, symptoms, course and treatment of disorders and diseases of the mind. The ultimate aim of this branch of medicine should be to ascertain the best means to promote normal thought and action individually and collectively, and to apply the knowledge so obtained to the causation and prevention of mental defects, disorders and diseases. Hitherto, unfortunately, little attention has been directed towards prevention, and not much, beyond detention, for the cure of the above.

**Mind and Body.**—There is a general feeling among the profession and the public that psychiatry should be more closely associated with general medicine than has hitherto been the case. As long as the psyche, the soul and the mind were used as synonymous terms, traditional belief that the psyche is an invisible intangible spirit that leaves the body at death dominated all our ideas of mental diseases and their treatment—or rather lack of treatment. Body and mind cannot be separated, for there can be no mind without memory and no memory without body, and all psychic processes are dependent upon physiological processes. Although the brain is the organ which stores the memory of past experiences and the bonds that unite and recall them, thus enabling the individual to adapt himself to environment in the struggle for existence, yet strictly speaking the mind is directly dependent upon the vital activities and harmonious interactions of all the organs and tissues of the body; for how could the brain make adaptations to environment without the receptor peripheral sense organs and the nerves which connect them with the spinal cord and brain? These are the avenues of intelligence, as is clearly recognised in the famous dictum: *Nihil in intellectu quod non fuerit prius in sensu*, [One cannot conceive of anything that one has not previously experienced through one's senses]; which should, however, be expanded by the addition of *et in motu* for every feeling, thought or desire causes a nervous discharge; to voluntary and involuntary muscles and their visible or invisible activation.

**Personality.**—Another fundamental function of the brain besides that of the life of external relation is the consciousness of the individual's own personality, his states of feeling, his appetites and his desires, which are due in great part to the organic and bodily sensibility. The ego is aware of his individual personality by the continuum of subjective feelings arising from the entire body in relation to its integral parts and as a whole to the external world. He is continually attending to alterations of this external and internal sensory continuum, and reacting instinctively, habitually or consciously, according to a judgment of value based upon past experiences. The sentiments and passions may be regarded as the outcome of the evolution and interaction of the primitive emotions connected with self-preservation, propagation and the social instincts. They are associated with specific and characteristic expressive reactions in the "mind muscles" of the eye and face, as well as in gesture, in postural attitudes and in inarticulate vocalisation.

This emotional language is similar and common to all human beings; for whereas articulate speech is entirely imitative and mainly intellectual and acquired, emotional language is an innate and untaught acquisition of the species *homo sapiens*. It has a much deeper significance than articulate language. It cannot be feigned when absent or hidden when present. It, therefore, reveals the real state of mind of an individual more truly than articulate speech. Repressed sentiments and passions find their expression in the "mind muscles" of the eye and face, and their study will often reveal the motives and secret dispositions of men. Moreover, a change in their reactions to thought and feeling may be the first outward sign of the onset of a mental disorder.

**"The Unconscious Mind" and the New Psychology.**—Dr. Carpenter in his work on mental physiology first called attention to the importance of the subconscious mind by giving examples of what he termed unconscious cerebration. He affirms: "The emotional state seems often to be determined by circumstances of which the individual has no ideational consciousness." Sigmund Freud (see PSYCHOANALYSIS) first propounded a theory of the subconscious mind and demonstrated the dominating influence of the "love instinct" (libido) in its widest acceptance as a great "life impulse" of vast significance in connection with the psychoneuroses and psychoses. This is shown, moreover, in the fact that the onset of the psychoneuroses and the psychoses especially occur when the sex instinct matures—adolescence; and wanes—climacterium—in both sexes. The mental conflicts associated with this "life impulse" bear a close relationship to the prevailing unrest of modern life, especially among women of the middle and upper classes to whom marriage in a majority and maternity in a still larger proportion are denied.

**Disharmonies.**—When the "life impulse" existing in the deeper levels of an individual's personality do not find a natural outlet and the means of adaptation to environment, there exists a disharmony between physiological and sociological conditions, which is ever increasing in the most cultured races. The non-gratification of this instinctive desire may be the source of a mental conflict, accompanied by fear and anxiety in a large number of men and women, especially the latter. Members of the medical profession constantly find a sexual basis for the mental trouble in the history and behaviour of their patients who are suffering from either a psychoneurosis (for example, hysteria, hypochondriasis, or neurasthenia) or a psychosis (for example dementia praecox, religious mania-depressive insanity and involutional melancholia). The frustration of the complete "life reaction," and its corresponding failure of release of emotional tension, profoundly influence all the functions of the involuntary and glandular structures of the body. The causes of these disturbances are inexplicable to the patient.

**Conflicts and Primal Instincts.**—The maternal "life reaction," as expressively symbolised by the Madonna and Child, is unfilled and incomplete in the majority of women, especially in the upper and middle classes. The mere gratification of the sexual passion is but an incomplete product of the instinct of preservation of the species; the complete fulfilment of which is to love, to

be loved, to give birth to children and to nourish and cherish them. It has been assumed that women would be happy if they were able to enter into all the pursuits and occupations of men, but modern psychology tends to show that these primal instincts still dominate, though hidden to our conscious feelings. When there is an antagonism between a primal instinct and the social instinct a mental conflict occurs which is thrust out of consciousness; it remains in the subconscious mind and, as Freud has shown, can be revealed by the investigation and interpretation of dreams; by psychoanalysis by free association; and by the method of word association and time reaction of Jung, who also applied the psychogalvanometric reflex to word association as a method of discovering a mental conflict in the subconscious mind.

The more complex society becomes, the more liable are these mental conflicts to occur. When there are conditions which tend to an inherited mental instability and lack of development of the highest control, psychoneuroses and psychoses proportionally become more prevalent. The fact, nevertheless, remains that human beings of every social grade and belonging to all races of men have in the past suffered and still suffer from the same types of psychoneurosis and psychosis.

*Effects of Civilisation.*—The mental conflicts brought about by the disharmony between physiological and sociological instinctive conditions of the "life reaction" and the morbid reactions they induce occur much more frequently in highly civilised races as compared with primitive races. There are, therefore, many reasons why psychoneuroses and psychoses should occur with much greater frequency in the former. The onset, course and symptoms are, however, fundamentally the same, the only difference being that the hallucinations and delusions and their mode of activation (behaviour) are coloured by the habits, customs, social usages and beliefs which constitute the greater part of the individual and collective furniture of the mind.

The late Dr. Mercier always maintained that mental diseases should be studied from the behaviourist point of view, and his work on *Disorders of Conduct* embodies his teaching. The behaviourist doctrine has especially flourished in America, where the investigations, experiments and observations of Prof. J. B. Watson on the behaviour of animals and infants have been of great value in teaching psychiatrists the importance of viewing their cases as problems of behaviour, although his explanations of abnormal behaviour are to most psychiatrists inadequate.

The psychiatric student who wishes to study conduct must take into account not only what a man says and does, but the circumstances or "setting" at the time. Thus a prosperous butcher, who on Saturday night is seen standing outside his shop in apron and shirt sleeves inviting people to come in and buy, would be considered a lunatic if he conducted himself in exactly the same manner outside his respectable suburban villa next morning. A man is regarded as insane who on account of mental disease no longer thinks, feels and acts in accordance with the usages and customs of the society to which he belongs, and is not held responsible for his behaviour if he does not know at the time the nature and quality of his acts.

#### CAUSES OF MENTAL DISEASE

The causes of mental disorders and diseases are never single, but they naturally fall into two great groups: (1) Endogenous (from within) and (2) Exogenous (from without). They may be somatic, psychical or social. The hereditary factor is the most important endogenous cause.

*The Endogenous Factor of Mental Disorders.*—The life of the individual begins at the moment of conception, *i.e.*, at the conjugation of the male and female germ cells. The raw material of character is a complex of inherited tendencies and dispositions impressed upon the individual by sex, species, race and ancestry, giving each individual a specific predetermined plasticity to receive and store stimuli and react to them in a particular way. Like tends to beget like—as Galton's *History of Similar and Dissimilar Twins* shows, in the dispositions and temperaments of the offspring.

A well-balanced mind is due to an inherent equipoise of the latent potentialities of character, and its efficient activity depends upon the potential psychophysical energy derived from the parental stocks. The study of heredity (1) by statistics, (2) by pedigrees and (3) by experience shows the importance of this factor in the causation of the true insanities which are not due to organic brain disease, where chance counts for everything and heredity for little or nothing. The raw material of mentality is conditioned by the innate potentialities of the fertilised ovum as it starts its course in life. At later stages of development, the fertilised ovum is influenced by pre-natal and post-natal exogenous environmental factors in addition to the hereditary factors.

*Pre-natal Exogenous Factors.*—Much may happen while the embryo is developing in the mother's womb. Owing to abnormal conditions of growth, interfering with the circulation and nutrition of the great brain, various degrees of arrest of development of the highest and latest evolutionary structures of the brain may occur, *viz.*, the cerebral hemispheres, which by their size especially distinguish the brain of man from the lower animals, and to which he owes his superior intelligence, may suffer from various congenital effects. Abnormal dynamic conditions of the cerebral vessels and of rate of growth of brain and *dura mater* may lead to anencephaly, microcephalic idiocy or low-grade imbecility (see article NEUROPATHOLOGY, 19.429). Again, pathological conditions may arise by which the cerebrospinal fluid secreted in the ventricles of the brain cannot escape, causing arrest of growth by pressure and (water on the brain) hydrocephalic idiocy. The embryo, during development, may become infected by the spirochaetes of syphilis circulating in the blood and lymph streams of the mother, resulting in abortion or congenital syphilis causing arrest of development of the brain and idiocy, or later in life of cerebral syphilis and general paralysis. Various poisons introduced into the body of the mother, *e.g.*, lead and alcohol, may cause abortion, and presumably may have a devitalising effect upon the developing embryo.

Again, absence of the thyroid gland in the embryo, or even hypothyroidism owing to goitrous disease of the gland with a failure of thyroxin in the blood (the essential element of which is iodine) may cause cretinous idiocy. The brain cells owing to this deficiency are arrested in their growth and fail to function, but if the cause is diagnosed in early infancy, and thyroid gland be administered, then the brain cells develop and grow and function normally. This cretinous idiocy is due to the absence of iodine in the environment. In districts far remote from the sea goitrous cretinism is common, *e.g.*, in Switzerland and certain districts of the United States (see GOITRE). The addition of iodide of sodium in the water or table salt has greatly reduced the numbers afflicted with this disease. What more striking proof can we have that the mind depends upon the harmonious interaction of all the organs and tissues of the body, since a chemical substance containing iodine is essential for the growth of the brain and mental development and for its proper function. Particularly in women about the climacteric period, a condition known as myxoedema, due to hypothyroidism, occurs, resulting in a slowing of thought and speech and often mental symptoms which disappear by administration of the gland.

A curious form of idiocy, associated with blindness, is only met with in Jewish children. It is characterised by a racially unique degenerative biochemical condition of all the ganglion cells of the sympathetic and cerebrospinal nervous systems. The convoluted pattern of the brain has a normal appearance quite unlike that of a low-grade imbecile or idiot; it is, therefore, a late congenital or post-natal racial morbid condition.

Arrest of the growth of the brain may arise from pre-natal causes previously stated; likewise prolonged labour or unskilful use of instruments may damage the brain and arrest growth. It has been calculated that 25% of the cases of idiocy and imbecility are due to non-inherited conditions. The remaining 75% of cases of mental deficiency are truly hereditary, and due to an innate lack of *vis propria* of the fertilised ovum, which leads to an arrest of development of the highest and latest evolutionary level of the brain.

*Hereditary Factor in Relation to Psychoses and Psychoneuroses.*—Study of the hereditary factor in psychoses and psychoneuroses by the construction of a large number of pedigrees extending to three, four and five generations with collaterals, and by a card system of 4,000 relatives who were or who had been in the London County Council asylums, proves that heredity plays a very important part in neuroses and psychoses.

Neuroses may be classified as follows: (1) hysteria, (2) neurasthenia, (3) obsessional psychasthenia, (4) epilepsy and (5) migraine; and psychoses as (1) paranoia (systematised delusional insanity), (2) dementia praecox, (3) manic-depressive insanity, of which there are several types, viz.: alternating periods of excitement and depression (*folie circulaire*) and recurrent periods of maniacal excitement or of melancholic depression, alternating with periods of sanity, (4) involutional melancholia occurring at the climacterium in women, also in men between the ages of 55 and 65, though less frequently met with than in women. Both the latter forms of mental disorder may terminate in dementia.

These three last-named types are in some ways related to one another, and their onset is associated with the maturation or waning of the sex instinct. An involutional melancholic or senile dement may have offspring in whom manic-depressive insanity or dementia praecox may occur in adolescence, or a parent with manic-depressive insanity may have one or more offspring with dementia praecox. This phenomenon together with the fact that not infrequently several members of the same co-fraternity suffer with either dementia praecox or manic-depressive insanity or an atypical form, coming on at puberty or adolescence at about the same age, shows antedating and hereditary predisposition as the important factor. There may be atypical cases in some respects resembling both these forms of mental disease, and it is a matter of opinion to which category a particular case should belong. This shows how fallacious classifications may be. The many changes which Kräpelin has made in his classification emphasise the fact that each case must be regarded as a biological problem with two factors to consider; viz.: what an individual was born with; and what happened after fertilisation of the ovum—that is, pre-natal and post-natal conditions. There is, it seems, a causal correspondence in these three types of insanity connected with the "life reaction" of the primal instinct of propagation.

*Disintegration of Psychic Unity.*—The biological concept of mental disease propounded by Hughlings Jackson in his *Theory of Evolutional Levels* will help in the understanding of the causes and symptoms of insanity—dissolution of the highest level bringing into relief lower levels. Thus a negative condition of the highest evolutionary level of control permits of over-action of the lower level of ideation, e.g., the delirium of fever. In mental disorders there may be a negative condition of the highest level of control with disordered ideation manifested by hallucinations and delusions, owing to partial disintegration of the psychic unity. Such hallucinations and delusions may determine various active uncontrolled and irresistible impulses—disorders of conduct. When the disease has sunk to a lower depth of dissolution of evolutionary levels there may result emotional indifference and apathy reflected in a mask-like expression, and motor inertia or katatonic stupor with *flexibilitas cerea*. Stuporose states with mental confusion indicate a more diffuse toxic influence on evolutionary levels and are more hopeful of recovery than the persistence of hallucinations and delusions, the mind remaining clear.

*Post-Natal Exogenous Causes.*—These do not play an important part *per se* in the production of the true insanities. They may, however, act as exciting or contributory causes in individuals with an hereditary latent tendency. Stress *per se* from disease and disasters of every kind cannot be the important factor believed to be in the production of the true insanities as distinct from organic brain disease, e.g., general paralysis and lethargic encephalitis. This was clearly shown during the War by the fact that Bonhöffer, an eminent Austrian psychiatrist, only found five insane among 10,000 Serbian prisoners.

Organic brain disease may cause various symptoms of irrita-

tions such as fits, headaches, pains, stiffness of muscles, and delirium or drowsy stupor, loss of memory, paralysis and dementia, according to the pathological process and the structures affected.

*General Paralysis of the Insane.*—General paralysis was formerly believed to be an insanity; it is now known to be due to the invasion of the tissues by the *Spirochaeta pallida*, i.e., the specific organism of syphilis (see *VENEREAL DISEASES*). That a positive Wassermann reaction of the cerebro-spinal fluid is found in practically every case is an indication that the spirochaete of syphilis in the brain is multiplying and producing a toxin that sets up a chronic inflammation followed by destruction of the neurone. The dementia that ensues is proportional to the degree of decay and destruction of the cerebral cortical grey matter. Serological methods have enabled a diagnosis of this disease to be made in 97% of cases, whereas prior to the employment of laboratory methods the diagnosis was correct in only 75% of cases, when controlled by post-mortem examination. This disease is preventable, and ought to be prevented, for it is found that it claims its victims from among the best physically and mentally in all grades of society. Chance is everything and heredity nothing in this disease. There is first the chance of infection and next the chance that the spirochaete lodges in the brain and colonises there.

Lethargic encephalitis (see *ENCEPHALITIS LETHARGICA*) may be followed by serious mental disorders; especially does it affect the moral sense in children and young adolescents.

#### MENTAL HYGIENE

Many advances were made in the practical sphere of action in the decade 1915-25. *A Mind that Found Itself* (1908), a book written in America, produced a great impression in that country on account of the author's vivid description of his personal sufferings as inmate of a mental hospital and of the manner in which everything except the right thing was done to restore him to health. Subsequently in the United States the author of the book, Mr. Clifford Beers, was instrumental in founding in 1916 "The National Committee for Mental Hygiene," having amongst its aims "the conservation of mental health"; the "prevention of nervous and mental disorders and mental defect"; the "raising of the standards of care and treatment of those suffering from such disorders and defects; the dissemination of reliable information upon these subjects."

A valuable periodical, *Mental Hygiene*, first issued in 1917, is published quarterly by the society, containing records of its work and recent advances in knowledge. Such an organisation has a potent influence for good, for it affects those suffering from mental disorder or defect and those also who through mental causes are unable so to adjust themselves to their environments as to live happy and efficient lives. Societies of mental hygiene have since been founded in France (Dept. of Seine) and in England on similar lines to that in America.

*Reforms in Treatment.*—A royal commission on Lunacy and Mental Disorder was appointed in Nov. 1924, to inquire into certain statements regarding illegal detention and ill-treatment and cruelty in asylums. For some time past dissatisfaction at asylum conditions had been prevalent amongst certain sections of the public which led to the formation of a National Society for Lunacy Reform supported by many distinguished persons.

The royal commission also investigated "the need of extending as a whole the privilege of treatment of insanity without subjection to the legal formalities of the Lunacy Acts," and of extending such other reforms as were embodied in the Medical Treatment bill 1923. This bill constituted a recognition by the authorities of the necessity long recognised by the medical profession for fresh legislation for the provision of funds for early treatment and research.

Mental disease is primarily a medical question, a part of general medicine, the fundamental principles of which are (1) to prevent disease, failing that (2) to cure or arrest the progress of disease, and failing that (3) to prolong life and relieve suffering. Till recently the ratepayers' money has been spent in building huge and sometimes palatial institutions, useful in the main for the detention and prolonging the life of certified chronic lunatics and senile cases. Little money has hitherto been expended in the endeavour to find out the causes of insanity by clinical, psychological, sociological and pathological research. Relatively few satisfactory efforts have been made

by the authorities to treat mental diseases in the early and curable stage, upon hospital lines.

*Treatment on Hospital Lines.*—During the War the public insisted that no soldier should be sent to an asylum unless proved to be suffering with an incurable mental disease or until after a probation of twelve months the disease was regarded as incurable. The same regulation applied to ex-service men under treatment by the Ministry of Pensions. This principle could not be applied to the civil population, because the conditions are different, since a man in the army or an ex-service pensioner is under control. The success of this method of dealing with mental disease in the army led the Board of Control to reconsider the question of the early treatment of insanity.

*The Maudsley Hospital.*—When Dr. Henry Maudsley, a great philanthropist, psychiatrist and philosopher, offered to the London County Council in 1907 £30,000 if they would build a hospital in London for the study and treatment of mental diseases in the early and curable stage, a real effort was made to deal with insanity on modern rational lines. The offer was accepted, and five years later a suitable site at Denmark Hill was found. The War came in 1914 before the hospital was finished. The building was completed in 1916, at the direction of the War Office, and served as the central nucleus of the Neurological Clearing Hospital for London. Dr. Maudsley died in 1917, and the council received by his will a further sum of £10,000. It was his expressed wish that this money should be expended in pathological investigation and research. For a time this hospital served as a neurological hospital for ex-service men under the Ministry of Pensions, and in 1922 it was taken over by the London County Council.

The Maudsley Hospital has an out-patients' department, and 150 beds for males and females. It has an adequate, efficient and highly qualified staff of medical officers. Early in the War the central pathological laboratory for the London County Council mental hospitals was removed from Claybury Asylum to the Maudsley Hospital, where routine clinical laboratory and serological investigations are carried out, thus affording excellent opportunities for research.

The Maudsley Hospital is a recognised school of the London University, and a course of lectures, together with practical instruction, is given to medical men who are desirous of qualifying for the Diploma of Psychological Medicine. The London County Council give study leave to their medical officers of asylums, and now require officers who apply for senior appointments to possess a University Diploma of Psychological Medicine or a diploma of the Conjoint Board of the Royal College of Physicians and Surgeons. Opportunities for research in the pathological laboratory are afforded to suitable applicants by the committee.

The Maudsley Hospital being a rate-aided hospital is primarily intended for those who have a London settlement, and the charge made varies according to the means of the patient. All inmates of the hospital are voluntary and uncertified. This allays the fear of the patients that they may be made permanent inmates, and inspires them with confidence in their treatment. Out-patients are thereby encouraged to attend the hospital, and in this way a more favourable prognosis is secured, for mental disorders and diseases are thus observed and treated in their incipient stages. This is advantageous to the patients, and it enables medical men to learn and understand the symptoms and early stages of mental disease. Too frequently the descriptions in text-books have been drawn from the more serious, the chronic and the incurable cases of disease seen in asylums; thus knowledge of the initial stages of mental disease has been inadequately taught. It is on these early cases, which either are, or ought to be, outside the asylums, with their large chronic incurable population, that the ratepayers' money can be expended with advantage, not only from a medical and social but also from an economic point of view.

Another move in the right direction, as regards research into the causes of insanity, has been made by the establishment of a Joint Board of Research of the Corporation and University of the City of Birmingham, and the establishment of an adequately staffed and equipped pathological laboratory. These opportunities for early treatment and research might with advantage be adopted by large cities on the lines of the Maudsley Hospital. Other schemes are embodied in the Memorandum to the Royal Commission on Lunacy and Mental Disorders by the Medico-Psychological Association of Great Britain and Ireland.

**PSYCHICAL RESEARCH** (see 22.544).—The increase of interest in psychical research all over the civilised world was signalled by the institution of international congresses, the first of which, attended by representatives of 12 countries, was held at Copenhagen in 1921, while 17 countries were represented at the Warsaw Congress in 1923. At these congresses the curious fact emerged that interest on the Continent was mainly concentrated on physical, in the United Kingdom and America on mental or psychological phenomena.

*Telekinesis and Teleplasm.*—Physical phenomena can be grouped under two main heads: *telekinesis*, or the movement of objects at a distance otherwise than by ordinary physical means; and *teleplasm*, or the extrusion from the body of the medium of a substance, sometimes amorphous, sometimes resembling portions of the human body or even complete figures. Phenomena of both these kinds have long been familiar, but it was only as the result of the investigations of J. Ochorowicz (*Annales des Sciences Psychiques*, from 1909 on) that the connection between the two was observed, and those who accept the reality of the phenomena believe that teleplasm is the mechanism behind telekinesis. Among the more famous "physical" mediums may be mentioned Stanislava T., Stanislava P., Guzik, Kluski, Franczek (all from Poland), Frau Silbert, Willy and Rudi Schneider, Eva C., Kathleen Goligher and Mrs. Crandon. Numerous scientific men of high standing investigated them and declared their conviction of the reality of the phenomena, but without so far obtaining general acceptance for their view either in the scientific world or among the public.

*Conditions of Research.*—The unbeliever argues (1) that the conditions usually demanded by mediums (e.g., dim light, refusal to permit the teleplasm to be handled or portions detached) facilitate deception; (2) that few investigators, however eminent otherwise, are skilled in the technique of detecting fraud, and (3) that, even so, practically all the well-known mediums have sooner or later been detected simulating phenomena, or at least have come under grave suspicion. All this the candid psychic researcher will admit, but he will join issue when the further claim is made that this disposes of the whole question: he will point to the investigations by the Society for Psychical Research of Eva C. and Willy Schneider (to name only two that have taken place in this country) as evidence that, under rigorous control exercised by investigators with full knowledge of fraudulent methods, results can be obtained which, if not absolutely demonstrating the reality of telekinesis and teleplasm, at any rate make out a very strong case for further inquiry.

The subject will not, however, obtain the serious consideration it deserves until an agreement be reached by all researchers (1) not to publish any report on a medium until he or she has been investigated by a committee of experts in detecting fraud, who report that they have witnessed phenomena *prima facie* genuine; (2) not to publish any report which does not set out in full detail all material facts as to persons present, methods of control, precautions to prevent fraud, measures to ascertain whether fraud in fact occurred, etc. The voluminous literature on the subject would be considerably reduced if all reports falling short of the latter standard were eliminated.

Until the phenomena are better authenticated it would be idle to refer at lengths to theoretic explanations of their origin. The continental observers generally reject the hypothesis of spirit action, and believe that the teleplasm is moulded in accordance with the subconscious ideas of the medium, and possibly the sitters.

Psychic photography is the one form of physical mediumship which has "caught on" in Great Britain; but, as Professor Richet, a not unduly sceptical critic of physical phenomena, remarks, "despite many attempts nothing reliable has been proved."

In addition to the physical phenomena produced by regular mediums there are the curious cases, reported from time to time in the Press, of mysterious noises, breakages of furniture, etc., in houses. Such *poltergeist* cases, as they are called, are particularly baffling, mainly because the enterprising journalist usually arrives on the scene before the trained researcher, and makes all serious investigations impossible. In most instances there will be found amongst the occupants of the house some person in a state of mental or nervous instability, often a child at the age of puberty, with whose removal the manifestations cease. Trickery, not necessarily deliberate or even conscious, but often very skilful, explains many of the cases, but it is not clear that it covers them all. Where there is trickery, the motive may be merely love of mischief or a desire for notoriety, and the apparent psychological affinity between the principal actors in poltergeist cases and regular physical mediums must be borne in mind when considering the question of deception, whether conscious or unconscious, on the part of regular mediums, especially when no normal motive for fraud can be traced.

*Mental and Physical Phenomena.*—Before passing from physical to mental phenomena it may be useful to consider what, if any, connection there is between them, beyond the historical one. In the early days of the spiritualist movement, down to the time of Home and Stainton Moses, the association was close. The same mediums produced both classes of phenomena, and both were attributed to spirit agency by those who accepted them. As, however, investigations became more scientific, a division developed: so far as concerns reasonably well-authenticated phenomena, the physical mediums came to form one group, the mental mediums another, and the temperamental differences between typical mediums of the two groups are striking. Were it not that both classes of phenomena appear to require for their production either trance or some less complete form of dissociation on the medium's part, there would seem to be no reason why they should continue to be treated as both subjects for the same branch of research.

*Mental Phenomena.*—Telepathy has probably gained wider acceptance than any other hypothesis connected with Psychical Research, and both in its spontaneous and experimental manifestations continues to be extensively studied. The most notable experiments in recent years are Professor Gilbert Murray's two series (*S.P.R. Proc.*, vol. 29 (1918) and 34 (1924) and Dr. Coover's experiments at the Leland Stanford Junior University, California (1917). In the Gilbert Murray experiments attempts were made to transmit complicated ideas or conceptions, e.g., of pictures, scenery, incidents from literature, imaginary and often fantastic occurrences, and a proportion of successes was obtained very largely exceeding what can reasonably be attributed to chance. In Dr. Coover's experiments with 100 students from his university it was sought to transmit the correct denomination of playing cards, and, taking all the students together, the successes only slightly exceeded the proportion attributable to chance; individual students, however, had results much above the average. The apparent discrepancy between the results of these two groups of experiments can be reconciled if the natural inference is drawn that subjects which arouse the interest or curiosity of the experimenters are more easily transmitted than mere numbers or pips on a card, and that subconscious boredom was at the bottom of the failure of the Californian students.

The Gilbert Murray experiments cannot be considered absolutely conclusive evidence of telepathy, as the conditions did not exclude the possibility of auditory hyperaesthesia, i.e., of Professor Murray having, subconsciously of course, overheard the agents discussing the subject to be transmitted. The records, however, especially of the later experiments, contain a good deal of evidence tending to negative this hypothesis, and it is to be noted that the experiments of Miss Miles and Miss Ramsden (*S.P.R. Proc.* vol. 21, 1907-9) were not prejudicially affected by the distances (in some cases hundreds of miles) separating agent and percipient.

*Spontaneous Telepathy.*—As regards spontaneous telepathy, evidence of the kind so carefully collected and discussed in

*Phantasms of the Living* continues to accumulate. In *S.P.R. Proc.*, vol. 33 (1923), a large number of cases reported to the S.P.R., including several very striking instances of apparitions closely corresponding with the death at a distance of the presumed "agent," are collected and classified by Mrs. Sidgwick, whose article on "Hindrances and Complications in Telepathic Communication" (*S.P.R. Proc.*, vol. 34, 1924) also deserves careful study. The combined evidence, experimental and spontaneous, although falling short of strict scientific demonstration of telepathy, raises the hypothesis to a very high level of probability.

Clairvoyance, or the supposed supernormal knowledge of matters not (as in telepathy) derived from another mind, is not so well attested, but there is a growing body of evidence in its support. Reference should be made to the experiments with Ossowiecki in reading the contents of sealed envelopes (Geley's *L'Ectoplasme et la Clairvoyance*, 1924) and the investigations of the "psychometric" powers of a Mexican lady by Dr. Pagenstecher and Dr. Walter Prince (*American S.P.R. Proc.* vol. 15 and 16). In this connection mention must also be made of the "book-tests" received through trance-mediums. The sitter is informed that a particular portion of a specified page in a book, identified by its position in a bookcase in a house where the medium has never been, will be found to contain a message to a particular effect: in the instances reported to the S.P.R. the number of successes largely exceeded chance probability (see *S.P.R. Proc.*, vol. 32 and 33, 1921 and 1923). Book-tests generally purport to be given by discarnate intelligences, and the subject matter of the messages, which is often appropriate to the supposed communicator, suggests at least some survival of memory.

In addition to the references already given, see R. Warcollier, *La télépathie* (1921); R. Tischner, *Über Hellsehen und Telepathie* (1921); C. Bruck, *Experimentelle Télépathie* (1925).

#### EVIDENCES OF SURVIVAL

As the results of bereavements caused by the War the number of persons consulting trance-mediums has enormously increased. Of the communications received at sittings a great part consists either of vague generalities or descriptions of a future life which, whether true or not, have no evidential value. But facts are frequently communicated which cannot reasonably be attributed to the medium's normal knowledge, and the question arises whether such facts are derived, as they purport to be, from some discarnate mind, or whether they can be explained as telepathic impressions received subconsciously by the medium from some living mind. The problem is a difficult one, as, assuming telepathy occurs, we are ignorant of the exact limits of its action: a very able attempt to elucidate this problem was contributed by Dr. Walter Prince to the Copenhagen Congress. (See *Compte Rendu* of that Congress.)

Further evidence shows that telepathy plays an important part in communications ostensibly coming from the dead. Thus a sitter received from a medium in the form of spirit-communications (1) details consciously imagined by himself regarding an entirely fictitious person and (2) statements concerning an acquaintance believed by him to have been killed in the War, accurate in every point except that the friend was in fact alive. Some of the statements referred to events recurring after the War, and some to things which happened, curiously enough, after the date of the sitting (*S.P.R. Proc.*, vol. 35, 1925). If, then, a medium can, not only in theory but in fact, collect information from the mind both of the sitter and of a person only connected in a remote way with either medium or sitter, the difficulties in the way of establishing survival by information conveyed in trance seem insuperable.

Where, however, as often happens, especially in "direct control," something more than mere information is conveyed, where, for instance, the turns of speech and the habits of mind of the ostensible communicator are reproduced in a lifelike manner, those who reject the spiritistic hypothesis have to assume, in addition to telepathy, a strong, perhaps an improbably strong, power of subconscious dramatisation on the medium's part.

**BIBLIOGRAPHY.**—Sir Oliver Lodge, *Raymond* (1916); Papers by Mrs. Sidgwick, Miss Radclyffe-Hall, Una, Lady Troubridge and others in *S. P. R. Proc.*, vol. 28 (1915), 30 (1920), 32 (1922), 35 (1925).

#### CONSCIOUS DESIGN

That telepathy impaired the evidence of survival derived from trance-communications was recognised by Myers and the other founders of the Society for Psychical Research, and it is of interest that evidence of a kind not readily explicable by telepathy first began to appear shortly after Myers' death, and ostensibly on his inspiration, in the form of "cross-correspondences" in automatic writing. It was found that several automatists, writing without knowledge of each other's scripts, would each produce fragmentary allusions to some topic. Taken separately the scripts meant little, but when compared the fragments fitted together to form a complex whole. There seemed a substratum of *conscious design*, not originating with any single automatist, or, as far as could be ascertained or imagined, with any other living mind, and accordingly supporting the claim, frequently made in the scripts, that they originated in a particular discarnate mind or group of minds (*S.P.R. Proc.*, vol. 20, 1906, *et seq.*). In one instance, however (the "Sevens" Case, *S.P.R. Proc.* vol. 25, 1911), the mind of a living person seems to some extent at least to have influenced the scripts.

Further evidence of design is afforded by the literary puzzles contained in automatic scripts of which the "Ear of Dionysius" is the most remarkable (see Mr. Gerald Balfour's paper, *S.P.R. Proc.*, vol. 29, 1918). In this case the automatic writings of a lady with little classical knowledge set out piecemeal and very allusively the story of the obscure Greek poet Philoxenus. Probably the majority of those who have taken honours in the Classical Tripos or "Mods" could not give the full story as recounted in the scripts; in fact, it is only to be found in one English book, a book never seen by the automatist, but known to have been possessed and used by the distinguished classical scholar, then dead, from whom the scripts purported to come.

These cross-correspondences and literary puzzles are difficult reading, a tangle of recondite literary allusions, but no student of the literature of survival should be deterred thereby from giving them careful consideration. If they have been correctly interpreted, they suggest the survival of a mind capable of originating and carrying out an elaborate plan, something more than the persistence of a psychic factor, which Dr. C. D. Broad is willing to concede (see *The Mind and Its Place in Nature*, 1925).

**BIBLIOGRAPHY.**—General. Particular volumes of the *Proc. Soc. Psy. Res.* and *American Proc. Soc. Psy. Res.* have been quoted but the whole series is important. On the Continent *Zeitschrift für Parapsychologie und Zeit f. Kritischen Okkultismus* ably represent the two main schools of thought.

See also E. Osty, *La connaissance supra-normale* (1923); C. Richet, *Traité de métapsychique* (1923); M. Dessoir, *Der Okkultismus in Urkunden*, Part 2 (1925); H. Driesch, *The Crisis in Psychology* (1925). F. Schrenck-Notzing, *Materialisations-Phänomene* (1914); *Physikalische phänomene des Mediumismus* (1920); W. J. Crawford, *The Psychic Structures at the Goligher Circle* (1921); "Reports on Eva C., Willy Schneider, etc.," *Proc. Soc. Psy. Res.*, vol. 32 (1922) and 35 (1925); G. Geley, *L'Ectoplasme et la Clairvoyance* (1924); M. Dessoir *Der Okkultismus in Urkunden* (1925). (W. H. S.)

**PSYCHOANALYSIS: FREUDIAN SCHOOL.**—In the years 1880-2 a Viennese physician, Dr. Josef Breuer (1842-1925), discovered a new procedure by means of which he relieved a girl, who was suffering from severe hysteria, of her various symptoms. The idea occurred to him that the symptoms were connected with impressions which she had received during a period of excitement while she was nursing her sick father. He therefore induced her, while she was in a state of hypnotic somnambulism, to search for these connections in her memory and to live through the "pathogenic" scenes once again without inhibiting the affects that arose in the process. He found that when she had done this the symptom in question disappeared for good.

This was at a date before the investigations of Charcot and Pierre Janet into the origin of hysterical symptoms, and Breuer's discovery was thus entirely uninfluenced by them. But he did

not pursue the matter any further at the time, and it was not until some 10 years later that he took it up again in collaboration with Sigmund Freud. In 1895 they published a book, *Studien über Hysterie*, in which Breuer's discoveries were described and an attempt was made to explain them by the theory of *Catharsis*. According to that hypothesis, hysterical symptoms originate through the energy of a mental process being withheld from conscious influence and being diverted into bodily innervation ("Conversion"). A hysterical symptom would thus be a substitute for an omitted mental act and a reminiscence of the occasion which should have given rise to that act. And, on this view, recovery would be a result of the liberation of the affect that had gone astray and of its discharge along a normal path ("Abreaction"). Cathartic treatment gave excellent therapeutic results, but it was found that they were not permanent and that they were dependent on the personal relation between the patient and the physician. Freud, who later proceeded with these investigations by himself, made an alteration in their technique, by replacing hypnosis by the method of free association. He invented the term "*psychoanalysis*," which in the course of time came to have two meanings: (1) a particular method of treating nervous disorders and (2) the science of unconscious mental processes, which has also been appropriately described as "depth-psychology."

**Subject Matter of Psychoanalysis.**—Psychoanalysis finds a constantly increasing amount of support as a therapeutic procedure, owing to the fact that it can do more for certain classes of patients than any other method of treatment. The principal field of its application is in the milder neuroses—hysteria, phobias and obsessional states, but in malformations of character and in sexual inhibitions or abnormalities it can also bring about marked improvements or even recoveries. Its influence upon dementia praecox and paranoia is doubtful; on the other hand, in favourable circumstances it can cope with depressive states, even if they are of a severe type.

In every instance the treatment makes heavy claims upon both the physician and the patient: the former requires a special training, and must devote a long period of time to exploring the mind of each patient, while the latter must make considerable sacrifices, both material and mental. Nevertheless, all the trouble involved is as a rule rewarded by the results. Psychoanalysis does not act as a convenient panacea ("*cito, tute, jucunde*") upon all psychological disorders. On the contrary, its application has been instrumental in making clear for the first time the difficulties and limitations in the treatment of such affections.

The therapeutic results of psychoanalysis depend upon the replacement of unconscious mental acts by conscious ones and are operative in so far as that process has significance in relation to the disorder under treatment. The replacement is effected by overcoming internal resistances in the patient's mind. The future will probably attribute far greater importance to psychoanalysis as the science of the unconscious than as a therapeutic procedure.

**Depth-psychology.**—Psychoanalysis, in its character of depth-psychology, considers mental life from three points of view: the dynamic, the economic and the topographical.

From the first of these standpoints, the *dynamic* one, psychoanalysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of *instincts*; that is to say, they have an organic origin. They are characterised by possessing an immense (somatic) persistence and reserve of power ("*repetition-compulsion*"); and they are represented mentally as images or ideas with an affective charge ("*cathexis*"). In psychoanalysis, no less than in other sciences, the theory of instincts is an obscure subject. An empirical analysis leads to the formation of two groups of instincts: the so-called "ego-instincts," which are directed towards self-preservation and the "object-instincts," which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible.

Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads toward the dissolution of what is living. In psychoanalysis the manifestation of the force of Eros is given the name "*libido*."

*Pleasure-Pain Principle.*—From the economic standpoint psychoanalysis supposes that the mental representations of the instincts have a cathexis of definite quantities of energy, and that it is the purpose of the mental apparatus to hinder any damming-up of these energies and to keep as low as possible the total amount of the excitations to which it is subject. The course of mental processes is automatically regulated by the "*pleasure-pain principle*"; and pain is thus in some way related to an increase of excitation and pleasure to a decrease. In the course of development the original pleasure principle undergoes a modification with reference to the external world, giving place to the "*reality-principle*," whereby the mental apparatus learns to postpone the pleasure of satisfaction and to tolerate temporarily feelings of pain.

*Mental Topography.*—*Topographically*, psychoanalysis regards the mental apparatus as a composite instrument, and endeavours to determine at what points in it the various mental processes take place. According to the most recent psychoanalytic views, the mental apparatus is composed of an "*id*," which is the reservoir of the instinctive impulses, of an "*ego*," which is the most superficial portion of the id and one which is modified by the influence of the external world, and of a "*super-ego*," which develops out of the id, dominates the ego and represents the inhibitions of instinct characteristic of man. Further, the property of consciousness has a topographical reference; for processes in the id are entirely unconscious, while consciousness is the function of the ego's outermost layer, which is concerned with the perception of the external world.

At this point two observations may be in place. It must not be supposed that these very general ideas are presuppositions upon which the work of psychoanalysis depends. On the contrary, they are its latest conclusions and are in every respect open to revision. Psychoanalysis is founded securely upon the observation of the facts of mental life; and for that very reason its theoretical superstructure is still incomplete and subject to constant alteration. Secondly, there is no reason for astonishment that psychoanalysis, which was originally no more than an attempt at explaining pathological mental phenomena, should have developed into a psychology of normal mental life. The justification for this arose with the discovery that the dreams and mistakes ("*parapraxes*," such as slips of the tongue, etc.) of normal men have the same mechanism as neurotic symptoms.

*Theoretical Basis.*—The first task of psychoanalysis was the elucidation of nervous disorders. The analytical theory of the neuroses is based upon three ground-pillars: the recognition of (1) "*repression*," of (2) the importance of the sexual instincts and of (3) "*transference*."

*Censorship.*—There is a force in the mind which exercises the functions of a censorship, and which excludes from consciousness and from any influence upon action all tendencies which displease it. Such tendencies are described as "*repressed*." They remain unconscious; and if the physician attempts to bring them into the patient's consciousness he provokes a "*resistance*." These repressed instinctual impulses, however, are not always made powerless by this process. In many cases they succeed in making their influence felt by circuitous paths, and the indirect or substitutive gratification of repressed impulses is what constitutes neurotic symptoms.

*Sexual Instincts.*—For cultural reasons the most intensive repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive gratifications of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it

reaches a first culminating point at or before the fifth year ("early period"), after which it is inhibited or interrupted ("latency period") until the age of puberty, which is the second climax of its development. This double onset of sexual development seems to be distinctive of the genus *Homo*. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution, form the dispositions for the subsequent development of character or disease. It is a mistaken belief that sexuality coincides with "*genitality*." The sexual instincts pass through a complicated course of development, and it is only at the end of it that the "*primacy of the genital zone*" is attained. Before this there are a number of "*pre-genital organisations*" of the libido—points at which it may become "*fixated*" and to which, in the event of subsequent repression, it will return ("*regression*"). The infantile fixations of the libido are what determine the form of neurosis which sets in later. Thus the neuroses are to be regarded as inhibitions in the development of the libido.

*The Oedipus Complex.*—There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations, that is, upon the relative strength of the forces concerned. The most important conflict with which a small child is faced is his relation to his parents, the "*Oedipus complex*"; it is in attempting to grapple with this problem that persons destined to suffer from a neurosis habitually fail. The reactions against the instinctual demands of the Oedipus complex are the source of the most precious and socially important achievements of the human mind; and this probably holds true not only in the life of individuals but also in the history of the human species as a whole. The super-ego, the moral factor which dominates the ego, also has its origin in the process of overcoming the Oedipus complex.

*Transference.*—By "*transference*" is meant a striking peculiarity of neurotics. They develop toward their physician emotional relations, both of an affectionate and hostile character; which are not based upon the actual situation but are derived from their relations toward their parents (the Oedipus complex). Transference is a proof of the fact that adults have not overcome their former childish dependence; it coincides with the force which has been named "*suggestion*"; and it is only by learning to make use of it that the physician is enabled to induce the patient to overcome his internal resistances and do away with his repessions. Thus psychoanalytic treatment acts as a second education of the adult, as a corrective to his education as a child.

Within this narrow compass it has not been possible to mention many matters of the greatest interest, such as the "*sublimation*" of instincts, the part played by symbolism, the problem of "*ambivalence*," etc. Nor has there been space to allude to the applications of psychoanalysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psychoanalysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between Psychiatry and all of these other fields of study.

*The Psychoanalytic Movement.*—The beginnings of psychoanalysis may be marked by two dates: 1895, which saw the publication of Breuer and Freud's *Studien über Hysterie*, and 1900, which saw that of Freud's *Traumdeutung*. At first the new discoveries aroused no interest either in the medical profession or among the general public. In 1907 the Swiss psychiatrists, under the leadership of E. Bleuler and C. G. Jung, began to concern themselves in the subject; and in 1908 there took place at Salzburg a first meeting of adherents from a number of different countries. In 1909 Freud and Jung were invited to America by G. Stanley Hall to deliver a series of lectures on psychoanalysis at Clark University, Worcester, Mass. From that time forward interest in Europe grew rapidly; it showed itself, however, in a forcible rejection of the new teachings, characterised by an emotional colouring which sometimes bordered upon the unscientific.

The reasons for this hostility are to be found, from the medical point of view, in the fact that psychoanalysis lays stress upon psychical factors, and from the philosophical point of view, in its assuming as an underlying postulate the concept of unconscious mental activity; but the strongest reason was undoubtedly the general disinclination of mankind to concede to the factor of sexuality such importance as is assigned to it by psychoanalysis. In spite of this widespread opposition, however, the movement in favour of psychoanalysis was not to be checked. Its adherents formed themselves into an International Association, which passed successfully through the ordeal of the World War, and at the present time comprises local groups in Vienna, Berlin, Budapest, London, Switzerland, Holland, Moscow and Calcutta, as well as two in the United States. There are three journals representing the views of these societies: the *Internationale Zeitschrift für Psychoanalyse*, *Imago* (which is concerned with the application of psychoanalysis to non-medical fields of knowledge), and the *International Journal of Psycho-Analysis*.

During the years 1911-3 two former adherents, Alfred Adler, of Vienna, and C. G. Jung, of Zürich, seceded from the psychoanalytic movement and founded schools of thought of their own. In 1921 Dr. M. Eitingon founded in Berlin the first public psychoanalytic clinic and training-school, and this was soon followed by a second in Vienna. For the moment these are the only institutions on the continent of Europe which make psychoanalytic treatment accessible to the wage-earning classes.

**BIBLIOGRAPHY.**—Breuer and Freud, *Studien über Hysterie* (1895); Freud, *Traumdeutung* (1900); *Zur Psychopathologie des Alltagslebens* (1904); *Drei Abhandlungen zur Sexualtheorie* (1905); *Vorlesungen zur Einführung in die Psychoanalyse* (1916). Freud's complete works have been published in Spanish (*Obras completas*) (1924), and German (*Gesammelte Schriften*) (1925); the greater part of them has been translated into English and other languages. Short accounts of the subject-matter and history of psychoanalysis will be found in: Freud, *Ueber Psychoanalyse* (the lectures delivered at Worcester, U.S.A.) (1909); *Zur Geschichte der psychoanalytischen Bewegung* (1914); *Selbstdarstellung* (in Grote's collection *Die Medizin der Gegenwart*) (1925). Particularly accessible to English readers are: A. A. Brill, *Psycho-Analysis* (1922); Ernest Jones, *Papers on Psycho-Analysis* (1923).

**PSYCHOLOGY** (see 22.547b, also **PSYCHIATRY**; **PSYCHOSIS**; **PSYCHOTHERAPY**).—The most important influence affecting recent developments of psychology has been the widespread use of experimental methods of investigation, and a general acceptance of their implications.

Experiment in psychology is, as C. S. Myers points out, "at least as old as Aristotle." But its systematic and unrestricted application to psychological problems, and particularly a recognition of all that this involves with regard to the general nature of psychological theory, are a comparatively recent growth. These, more than anything else, have brought psychology into line with the other biological sciences, have transformed its questions from those of descriptive analysis to those of function, have contributed most powerfully to the destruction of the purely introspective, atomistic or mosaic psychology of the past and have encouraged and rendered possible the important practical applications of psychology which have characterised the period under review, and are particularly vigorous at the present time.

**Behaviourism.**—This account of general theoretical developments may begin by a reference to behaviourism, itself a direct result of the application of experiment to psychology. The early behaviourists were all interested mainly in animal conduct. They studied, not merely the reactions of particular parts of an organism, but the response of the organism as a whole; not merely the effects of particular isolated stimuli, but the influence of what they called the "whole situation," including in the latter the past history of the organism itself. They tried to show how more complex forms of response (e.g., instinct and habit responses) may grow up out of combinations of simpler reaction (e.g., tropisms and reflexes), and they made a great amount of use of Pawlov's principle of "conditioned reflex," erecting it into the most important explanatory principle of complex forms of conduct. They then applied exactly the same methods

to the study of human behaviour. They tended at once to become philosophical, and to assert that there is no such thing as consciousness, thereby opening up a large amount of fruitless and violent controversy. All that their method demanded they should assert was that consciousness need not be invoked as a determining condition of any form of response with which the psychologist must deal. Perhaps no psychologist has yet provided a thoroughly convincing refutation of this position, but the attempt to establish the precise functions of consciousness in human conduct—whether stimulated directly by behaviourist writings or not—has produced much important research.

**Relations with Physiology.**—Experimental physiologists have made striking advances in our knowledge of the physics and chemistry of muscular contraction, of the effects of glandular secretion, of the conditions and character of the conduction of nerve impulses, and of the functions of peripheral nerves and of the central nervous system. These have all helped to delimit the range of psychology, to show, that is, precisely where the psychological problems emerge. Of the most direct significance to the psychologist have been the researches of neurologists—provided with unrivalled experimental material in the course of the World War—into the effects of localised injuries to the brain and spinal cord. Perhaps the most significant of these is the work of Henry Head, who has carried further his investigations of the functions of the afferent sensibility by a thorough study of the "high level" responses involved in the use of language. His work represents the first attempt to carry out a searching investigation of the problems of aphasia by the systematic application of specifically psychological tests.

**Psychical Activity.**—Broadly speaking the result of all this work seems to show that conditions which at present, at any rate, have to be treated as definitely "psychical" play an efficient part in the determination of all highly developed conduct, and that the most fundamental of these have to do (a) with the emergence of *meaning* as a factor in response, (b) with the development and functions of *images* and (c) with the growth and reactive significance of the various forms of *feeling*. Thus although the methods of control of pre-conscious and conscious reactions may be the same, the factors in control appear to be different.

**Gestalt Theory.**—More purely psychological paths of approach seem to converge toward the same conclusion. What is known as *Gestalttheorie* has had a great influence upon recent psychological formulations. This, developed by Wertheimer and his associates, was in the first place concerned with the psychology of perception. Its central contention is that all of the material (or "objects") dealt with at the level of psychological responses are *Gestalten*, (wholes, forms, configurations—there is no exact English equivalent) diversified or complex, but in no sense capable of expression in terms of the parts which they may seem to contain. It is perhaps not unfair to say that the whole of this important movement is concerned with an elucidation of the character and functions of *meaning* in psychological responses.

**Imagery.**—Another active development is connected with the names of Jaensch and of his collaborators and pupils. Jaensch claims to have discovered a new and important type of imagery, photographically accurate, projected, coloured and abnormally resistant to the usual wearing effects of time. Such imagery is common in early life, but later is overlaid or outgrown, and is called *eidetic*. These workers try to show that all psychological problems centre in the use and functions of *images*.

**Psychoanalysis.**—Most prominent of all, particularly outside strict academic circles, has been the influence of a variety of views which are generally rather loosely put together and referred to as "psychoanalysis" (*q.v.*), Freud, Jung, Adler and a host of enthusiastic followers in all countries, have developed and promulgated its doctrines. Probably most psychologists would maintain that the practical significance of psychoanalysis outweighs its theoretical importance, but a convinced psychoanalyst is rarely willing to admit that this is the case. This movement, in all its many, and often conflicting forms, has conclusively demonstrated the enormous part which may be played

in the determination of human response by factors which remain totally outside the range of normal waking consciousness. Here also, we have at its height the tendency to concentrate upon *feeling* as the predominant psychological factor in the explanation of conduct.

*Social Psychology.*—Social psychology, largely under the influence of the writings of McDougall, and also affected to a considerable extent by modern psychopathology, has been very much to the fore. Lately attempts have been made in various directions to bring social psychology more immediately into touch with ethnology, history and economics, and so to check its hitherto marked tendency to wide and rash generalisation.

*Experimental Psychology.*—These more general and inclusive movements, though all largely influenced by experimental method, contain many features that can hardly be said to have a definite experimental basis. If we turn to a survey of the field of experimental psychology proper, we are met by a bewildering diversity of effort. There is hardly any problem over the whole range of individual conduct which some experimentalist has not attempted to tackle. Probably the chief impression to be obtained is that even in the field of sensorial reactions there is comparatively little that has been treated as completely and finally established. Yet more obviously is this true of the psychology of perception, of recall and memory, of imaging, of thinking in all its forms, and of feeling and willing. But in all these fields alike evidence is accumulating to show that no formulation of the conditions of reactions which confines itself to physical and chemical and to physiological terms is adequate to account for the complexity of life at the human level. On the whole, for example, the James-Lange hypothesis of the causation and character of emotions becomes less, rather than more certain, as research progresses.

*Applied Psychology.*—Particularly striking developments have occurred in the realms of applied psychology. The most important of these have concerned (a) education, (b) industry, (c) medicine and (d) law.

*Education.*—The psychological problems which have taken the most prominent position in relation to education have concerned the theory and application of intelligence tests (*q.v.*). In every country numerous groups of tests of intelligence have been proposed and used. At the same time the theoretical study of the relation of these tests to the nature and functions of intelligence has been pushed much further. There is still frequent and vigorous controversy as to the nature of "general intelligence," or of a possible "general factor" in intelligence (*see INTELLIGENCE, HUMAN*). In this, modern psychology has made great use of statistical methods. In many quarters intelligence tests have been employed to supersede or to supplement the common written examination. Numerous attempts have been made to render the tests more immediately practical by adapting them to groups rather than to individual children. Apart from intelligence tests proper, tests of capacity for practically every kind of specific ability involved in educational attainment, from "low level" motor activities to the most complex co-ordinations of mechanical and intellectual skill, have been developed and applied. The enthusiasm of the mental test devotee has, in fact, probably far outrun his discretion. At the same time the practical application of psychological principles to methods of teaching has been much emphasised, and in particular there has been a persistent and widespread effort to co-ordinate the treatment of mental defect in children with its precise experimental study. The psychoanalytic movement has had a profound influence in most countries upon methods of education particularly of young children.

*Industrial.*—America led the way in the application of psychology to industrial organisation and administration. But the movement spread rapidly and at present England, France, Italy, Germany, Holland and other countries all have strong and active institutions concerned with the study of the human element in industry. In the main the problems dealt with are of three types: (a) those of vocational guidance and selection (*see JOB ANALYSIS*); (b) those of industrial fatigue (*see INDUSTRIAL*

PSYCHOLOGY) and (c) those of motion study, vocational guidance and selection is definitely related to the mental test movement, and is directed to the avoidance of misfits in industry, and to the guidance of individuals into those industrial occupations for which their special abilities particularly fit them. The study of industrial fatigue is directed to an amelioration of working conditions so as to avoid undue irritability, overstrain, weakening of interest and general loss of capacity, and at the same time to retain and increase industrial productivity. Motion study is directed to the elimination of unnecessary movements in manual work, and to the discovery of paths of movement and methods of work which are alike agreeable to the operative and economically desirable. A very important branch of the third of these movements is the study of the human factor in industrial accidents. Standardised diagnostic tests for the "accident prone class" are in process of rapid formation. Closely related to its industrial application is the use made of psychology in naval and military organisation. This was greatly stimulated by the demands of the World War, and is now widely recognised.

*Medicine.*—The War, again, had a large influence in arousing increased interest in psychological medicine. Modern trench fighting enormously increased the incidence of mental and nervous disorders in the forces engaged, and consequently the tremendous social importance of the treatment of psychopathological states has been forced upon the public attention. In every civilised country the psychological genesis and nature, as well as the frequency, of numerous disorders possessing obvious physical symptoms are now widely acknowledged, and training in the recognition and treatment of mental disease is far more generally a part of medical education than has ever before been the case.

*Legal Problems.*—This once more has important and immediate applications to legal procedure. The relation of the study of mental disease to the problems of legal and moral delinquency is now freely admitted. Modern theories of the causation of abnormal conduct are applied to an understanding of the behaviour of the criminal. The general aim here is to be able, within limits, to control behaviour in the directions which are recognised as legally and socially desirable. A beginning has also been made—mainly by the use of modern experimental methods of the registration of emotional expression—in the development of a psychological technology for the detection of crime. Not much work has been accomplished in the application of psychological theories and methods of explanation to problems of religious and aesthetic experience.

*Conclusion.*—This brief survey of contemporary psychology shows the diversity of its interests, and the many-sided development which it has undergone. Such development was, indeed, inevitable. For psychology is a systematic attempt to understand the responses which man makes to his environment, and consequently has vital significance in relation to all branches of human effort. What has emphatically characterised psychological developments during the period under survey, is the tendency to make of psychology a science more concrete, more realistic, more closely in touch with actual human responses as they can be observed under definite conditions of reaction. At the same time the older, more purely introspective, more philosophical psychology has been far from inactive. In the main it has been preoccupied with problems of an epistemological order, and particularly with elaborate analyses of the factors which enter into perception as a form of knowledge (*see KNOWLEDGE, THEORY OF*). Everywhere in psychology the main drift appears to be away from atomistic and mechanical types of explanation toward a recognition of the unique, though complex, activities and patterns of activity which govern and direct all highly developed human conduct and feeling, and gradually build up the constructions of human knowledge.

*BIBLIOGRAPHY.*—The period surveyed has been one of extraordinary literary activity. Nothing more is here attempted than the selection of a few representative books. The order follows that adopted in the above article; only books having a predominant psychological interest are mentioned.

*Behaviourism*: J. B. Watson, *Behaviour: an Introduction to Comparative Psychology* (1914); *Psychology from the Standpoint of a Behaviourist* (Philadelphia and London, 1918). For a completely opposed point of view see W. McDougall, *Outline of Psychology* (1923).

*Gestalttheorie*: K. Koffka, *The Growth of Mind* (1924); W. Köhler, *The Mentality of Apes* (1925); M. Wertheimer, *Drei Abhandlungen zur Gestalttheorie* (Erlangen, 1925).

*Eidetic Imagery*: G. W. Allport, "Eidetic Imagery," *Brit. Jour. of Psychology*, vol. 15 (1924), with bibliography.

*Psychoanalysis*: etc.: C. G. Jung, *The Psychology of the Unconscious* (1917); E. Jones, *Papers on Psychoanalysis* (1923); C. G. Jung, *Psychological Types* (1923); A. Adler, *The Practice and Theory of Individual Psychology* (1924); S. Freud, *Collected Papers* (1924-5).

*Social Psychology*: M. Ginsberg, *The Psychology of Society* (1921); W. H. R. Rivers, *Psychology and Politics* (1923).

*Experimental Psychology*: C. S. Myers and F. C. Bartlett, *A Text-Book of Experimental Psychology*, Parts 1 and 2 (Cambridge, 1925). See also current psychological periodicals. (F. C. B.\*)

**PSYCHOSIS** (see 22.554).—Strictly speaking, the term psychosis means a state of mind, a concrete psychical process or a mental act; but is now generally used to signify an abnormal state of mind. This definition needs qualification, however, since the technical use of the term in psychiatry is confined to certain forms of mental disorder which can be distinguished from states of congenital mental deficiency on the one hand, and from "borderland" conditions or neuroses on the other. A distinction should be made between "psychosis" and "insanity," which in popular and legal language signifies that an individual, owing to his state of mind, is unable to manage himself or his affairs, is in need of care and control and is not to be held accountable to society for his actions.

Psychosis, on the contrary, is a strictly medical term; it refers to a type of mental illness with certain intrinsic characteristics, assuming various forms, and due to a variety of causes. It does not necessarily lead to serious disturbances of behaviour, and there are many individuals who though not insane in a legal sense are nevertheless the subjects of a psychosis from the standpoint of psychiatry.

*Psychological Considerations*.—Though it is convenient to divide mental disorders into different categories based upon their causation, clinical characteristics or course and outcome, so many transformations of the clinical syndromes occur that no hard and fast division into separate disease entities is possible. One broad division is that made between the psychoses proper and the neuroses, a term embracing such morbid conditions as hysteria and obsessional neurosis. The difference between the two types of reaction is intuitively sensed by society for reasons which become evident when their psychological characteristics are contrasted. One of the essential features of a neurosis is the retention of what may be called the "herd-sense," and a psychosis is marked by its diminution or loss. In a neurosis the patient is oriented to realities and has an intelligence alive to his own needs; his symptoms tend to be provoked by external circumstances, and he is sensitive to changes in the social atmosphere; he sees facts as they are but meets them in a faulty way. He does not seriously offend against the conventions, and however exacting his conduct may be his *entourage* still regard him as akin to themselves—as, indeed, he is, since all persons are apt to exhibit mild neurotic symptoms when life becomes too complex and difficult.

In a psychosis, however, the irruption of images, feelings and cravings into consciousness leads to distorted views of reality and to falsification of facts; the sentiments and habits of the patient undergo a change, and his conduct becomes inexplicable and (apparently) unmotivated; he becomes indifferent to public opinion and impervious to solicitations from without; briefly, he loses touch with common life and lives in a world of his own. Such attitudes naturally provoke uneasy tensions in normal people; they feel themselves to be in the presence of something uncanny and outside the range of their experience. It is disconcerting to deal with an individual whose conduct fails to be influenced by the methods hitherto found effective in dealing with other human beings, and no doubt the fear of the biologically abnormal has something to do with the attitude of society towards the psychotic.

*Psychosis and Neurosis*.—A psychosis is thus a malady of more serious import than a neurosis. The latter is a regressive and infantile mode of adjustment to reality—an act of adaptation that has failed (Jung). In a neurosis, fears, obsessions, doubts, ruminations, day-dreams and crises of agitation—incomplete, exaggerated and unproductive mental operations involving but little effort—serve as substitutes for efficient action. Some years ago Freud described the neuroses as defence mechanisms, and the validity of this conception was demonstrated in the War neuroses, where the conflict between duty and the instinct of self-preservation was solved without the sacrifice of social esteem by the automatic development of tremors, paralyses and anxiety states, which, as Rivers showed, were modifications of those instinctive processes by which all the higher forms of animal life were accustomed to react to danger.

*Protective Function of Neuroses*.—Here the neurosis clearly served to protect its subject from the situations for which he lacked the proper personal adaptation; it acted as a structure of compromise between himself and society; and it symbolised the nature of the instinct which demanded an outlet and gratification. The neuroses of peace have a similar mechanism and fulfil a similar function, though the nature of the instinctive need which finds an outlet in neurotic symptoms is the subject of considerable controversy. Freud traces it to the sexual impulse, while Janet discovers in the behaviour of a neurotic a means of gaining power and love which he lacks the capacity to earn by vigorous and effective action.

*Psychosis and Destruction*.—In contrast to a neurosis which acts to the advantage of the individual by protecting him from an uncongenial environment, a psychosis always acts in the long run to the disadvantage of the individual, and tends to bring him into conflict with society. It is destructive rather than protective, and tends to eliminate rather than to conserve the individual as a social unit. A psychosis originates in the depths of the organic life. The images which flood the psychic life are stimulated by subtle changes in the vital processes responsible for the evolution of the personality, and remain until the organic balance is restored. Hesnard names this process *organic symbolism*, pointing out that just as the sensation is the symbolic translation or meaning of the exciting stimulus and not this stimulus simply transmitted, so the psychosis is the psychic interpretation of organic occurrences. This formula may be applied to the psycho-physiology of hunger, which Torro aptly describes as an "echo of physiological distress and at the same time the dawn of psychic life." A morbid instance of this process occurs in the climacteric psychoses, in which the patient often complains of being dead, of ceasing to exist, or of being a shadow without life (delusion of negation). Here the biological changes heralding the termination of reproductivity are clearly symbolised in the content of the psychosis. The delusions and hallucinations of the psychotic should thus not be regarded as fancies; they are the symbols of organic actualities. The patient is right in adhering to his beliefs; he knows and feels them to be true, and has more reason on his side than the psychiatrist who would vainly persuade him to the contrary.

*Two Groups of Psychosis*.—The differentiation by Kraepelin of the psychoses into two broad groups—manic-depressive insanity and dementia praecox—has been of inestimable service to psychiatry, though his view that these should be regarded as distinct disease entities has not been established. It is more in accordance with clinical facts to regard them as two reaction types which sometimes occur in pure form but more often as mixed. The manic-depressive reaction is characterised by severe and irregular fluctuations of mood in the directions of excitement and depression with intervals of normality. The psychosis is an exaggeration of the "cyclothymic" reaction of some normal people in whom the mood fluctuates between euphoria and depression more or less independently of circumstances. Dementia praecox tends to pursue an unfavourable course, and is characterised by a peculiar and often complete disorganisation of personality with predominant changes in the affective life and will.

*Schizophrenia and Paraphrenia.*—As the disease does not always proceed to dementia, and may develop at any age, Bleuler prefers to apply to it the term *schizophrenia* (splitting of mind). Jung has stated that the essence of dementia praecox consists in the fact that the unconscious to a large extent replaces the conscious, and the validity of this formulation is clearly exemplified in those schizophrenics to whom the term *paraphrenia* is given. This psychosis is marked by the exuberant development of fantastic delusions and hallucinations, which appear all the more extraordinary as the personality is so preserved as to enable the patient to make a normal reaction to social life on occasions. The morbid mental products in these cases can properly be regarded as an echo of the ultimate realities of organic life. As Blondel observes: "*La conscience morbide s'exprime en dehors des lois de la conscience sociale par des procédés, non plus seulement prérationnels, mais prénormaux, qui manifestent l'individuel pur.*" In the schizophrenic there is an hypertrophy and distortion of the instinctive life, and the delusions and hallucinations symbolise or reveal crudely the elemental cravings which seek expression. The psychosis has thus an important biological function, affording a means by which the inward craving can be actualised and freely expressed; it brings about a state of biological equilibrium by permitting a release of organic tension. These paraphrenic cases are of the highest psychological interest. It is possible at times to watch the growth of organised hallucinatory systems which assume the characteristics of omnipotent and god-like personalities, symbolising, as it were, the ruthless and impersonal forces of nature. The interactions between the personality of the patient and the forces which control it are often as dramatic as those between the mythological characters of Greek tragedy; and the psychosis, like the latter, fathoms the depths of human life.

*Causation and Treatment of Psychoses.*—A psychosis is a disorder of behaviour, and represents a failure of function at the psychological level. Psychiatry (*q.v.*) thus differs in its subject-matter from general medicine; the former deals with disturbances in the reactions of the organism as an integrated whole, and the latter with disorders of special systems of organs. Since the behaviour of an individual, whether normal or abnormal, depends upon an infinity of factors—the nature of his life situations, the state of his organism, and the whole of his past history, both personal and ancestral—it is impossible to select one factor as explanatory of the total reaction. The problem of causation in the psychoses is thus dissolved in relativity, and in each case an endeavour is made to seek out, and remove where possible, any factors, either physical or mental, which seem to be exerting an unfavourable influence upon the behaviour.

*Mode of Approach.*—There is now a general tendency to approach the problems of mental disorder from the standpoints of biology, pathology and general medicine, as it is recognised that the psychoses must be the outcome of a malfunctioning organism. Many psychoses, indeed, have definite relationships to diseases of the nervous system and of the bodily organs, as well as to general disturbances due to infections, exhaustion and drug intoxications. The causal significance of foci of chronic infections from the nose, throat, teeth, uterus or intestines has recently been emphasised and investigations along these lines make it evident that the whole resources of medicine should be utilised in the treatment of mental disorder. Mind cannot be regarded as an entity and detached from the body, and the secrets of disordered personality cannot be discovered by confining researches to the brain. The mind is not merely a function of the brain; it is a function of the whole organism having its roots in the viscera, the endocrine glands, the vegetative nervous system and the musculature. Clinically, the biogenetic psychoses, the general characters of which have been outlined above, appear primarily due to deterioration and distortions of the affective and instinctive rather than of the intellectual functions, and such impressions are confirmed by the researches of Mott in relation to dementia praecox, showing that the disorder is the expression of an inborn lack of durability throughout the body, but most manifest in the organs of reproduction.

*Biogenetic Psychoses.*—In contrast to the toxic-exhaustive group of psychoses or an organic psychosis such as general paralysis, which are accidental episodes in the life of normal people, the biogenetic psychoses are the outcome of an hereditary or constitutional predisposition to mental disease. The psychotic episodes may be excited by mental or physical stresses, but the tendency already exists. The different forms assumed by these psychoses are independent of any specific pathogenic agent and dependent upon the personality, make-up or inborn psychic constitution. Thus a manic-depressive psychosis is considered to exhibit an exaggeration of a pre-existing cyclothymic or extraverted temperament, and dementia praecox of a pre-existing schizophrenic or introverted temperament. Kretschmer has noted a relationship between certain forms of physique and these psychic types. He finds that the cycloid types show a biological affinity with a pyknic body-build, while the schizoid types are related to asthenic and athletic body-builds, together with certain dysplastics. This work sheds light on the organic foundations of temperament, and has an intimate bearing on the problem of the biogenetic psychoses.

*Treatment Problems.*—The psychoses do not offer a fertile field for the application of formal psychotherapeutic procedures, such as hypnotism and psychoanalysis; their subjects lack insight and sense of illness, and tend to be non-co-operative and impenetrable. Indirectly, however, psychological treatment plays a large part in the prevention, cure and amelioration of psychoses. Thus re-education, the elimination of faulty habits of reaction and the stimulation and exteriorisation of interest by work and recreation are essential elements in treatment. Every administrative act intended to increase the amenities of patients in a mental hospital is mental treatment, and results in an improvement in the reactions of the patients as a whole. The more the freedom allowed, the more the institution corresponds to the conditions of ordinary life, and the more the contacts with the outside world the more normal the patients become. Individual peculiarities and unsuspected sensitivities (conditioned responses) must be noted. Thus a relapse may be provoked by the visit of a wife; an inaccessible schizophrenic may break into blushes, smiles and loquaciousness when visited by her father; or a patient may exhibit a negativistic attitude to one nurse and respond with friendliness to another.

*Influence of Psychogenetic Factors.*—Psychogenetic factors thus largely influence for better or worse the reactions of a psychotic. Jung points out that a normal introvert in a thoroughly congenial environment expands and relaxes towards complete extroversion; conversely, a sensitive shut-in child may regress into a mild psychotic state in what (to him) constitutes an unfriendly environment where he is not understood. Such observations have an important bearing on the problem of heredity. Some psychiatrists suggest that the continual association of a child from birth with exacting psychopathic parents (psychic trauma) is responsible for the development of psychoses later in life, but no doubt the inborn predisposition is an essential element in the causation of such cases. Psychogenetic factors are certainly in part responsible, however, for breakdowns of the dementia praecox type, and many such might perhaps be avoided if the significance and dangers of an inborn sensitivity were more generally appreciated.

Devine, "The Reality Feeling in Phantasies of the Insane," *Brit. Jour. Psych.* (1923); A. Hesnard, *L'inconscient* (1923); E. Kretschmer, *Physique and Character* (1925); P. Janet, *Psychological Healing*, 2 vol. (1925). (H. D.)

**PSYCHOTHERAPY.**—The method in psychotherapy that especially characterises the period since 1910, is the method of psychoanalysis devised by Sigmund Freud, and the theory based upon its findings bulks largely in all modern discussions.

*Modern Developments.*—Leaving aside this modern method of psychoanalysis, (see PSYCHOANALYSIS, FREUDIAN SCHOOL OF) we find that with many other workers in psychopathology and psy-

chotherapy there has been a steady movement away from the employment of hypnotism, whether for the investigation of the mind or for its treatment. Pierre Janet and Morton Prince alone among the older workers have continued to employ hypnotism in selected cases. Dubois, of Berne, has modified the suggestion treatment of Liébault and Bernheim in the direction of an appeal to reason in the patient rather than to mere automatism. In this method we find the arts of persuasion developed to the utmost on the conscious plane. The patient is encouraged to look at himself sincerely, to see himself exactly and to find out what is wrong with himself, what is the cause of his symptoms, and then is persuaded to change his mental outlook. The symptoms may be helped sometimes by philosophical disquisitions and exhortations. Dejerine advocated a similar method of analysis and persuasion, in which through a series of talks with the patient, the doctor induces him to admit what is really wrong with him, and encourages him to get out of his difficulties and so dispense with his symptoms. Babinski holds a simple theory of the nature of hysteria, according to which it is caused by suggestion and therefore curable by persuasion. The methods of persuasion which he indicates are of the simplest.

*Analytic Psychology.*—C. G. Jung and A. Adler have broken away from the direct Freudian line of thought. Jung calls his method that of analytic psychology, and emphasises the special need of analysing the present situation of the patient, interpreting his past in the light of his present, quite as much as conversely. He does not accept the Freudian view of the sexual etiology of the psychoneuroses, and although he uses the word libido in his general theory, this means for him general emotional energy, not specifically sexual energy. His general theory is one of indeterminism in contrast with the rigid determinism of Freud.

*Self-Assertion.*—Adler emphasises the important part played in the formation of nervous symptoms by the fundamental instinct of self-assertion—the will to power. In his view many neurotic symptoms are compensatory, representing the patient's (unsuccessful) striving "to become a complete man"—that is the phrase he uses—and to hide his insufficiency from himself as well as from others. The patient constructs a safety net, as it were, around himself, so as to prevent his sensitive ego from being unduly pained by the consciousness of its inadequacy. Adler would explain many cases in which a sexual etiology seems more obviously involved as really caused in this other way, through disturbance of the self-assertive instinct. The patient's self-assertive instinct cannot realise itself in ordinary ways, so it realises itself in a round-about way. All the time there is a tendency for the person to conceal from himself his own inadequacy, or to prevent himself from facing a situation where his own inadequacy might become too obvious. He may become ill in order to escape having to face a task to which he knows that he is inadequate. The feeling of inadequacy is translated into a feeling of illness. This inadequacy may show itself in various ways. Adler claims that the psychological essentials of a case may often be revealed in a single interview.

*War Cases.*—During the World War various forms of psychoneurosis were produced by the conditions of warfare in thousands of cases, and some of Pierre Janet's most fundamental views on the nature of hysteria were verified. Among the numerous cases of shell shock a certain proportion suffered from hysterical symptoms, and it was found that these hysterical cases were easily hypnotised, and through hypnosis the man could be re-associated, and his hysterical tendencies thereby diminished. In other words the scientific validity of Janet's use of hypnosis in special cases, was confirmed by the investigation and treatment of hundreds of such cases in the battle area. In ordinary medical practice these cases are not numerous. The ordinary medical man sees only a few cases a year, but when they are seen by the hundred as during the War, general conclusions can be drawn about them, they can be distinguished definitely from other cases, and cases of so-called natural somnambulism were most quickly cured by the production of artificial somnambulism under special safeguards. In other cases suggestion treatment is beneficial.

*Hypnotic Treatment.*—There is thus still a place for hypnotic treatment in psychotherapy. It should be limited to the treatment of pronounced cases of hysteria with loss of memory and crude automatisms like somnambulism, hysterical attacks and fugues. In such cases it removes the symptoms, and diminishes the hysterical tendency also. To correct the hysterical tendency still more adequately, it would seem desirable to give the patient a certain amount of analytic treatment, discussing his past life with him, sorting out his past experiences, and helping him to see the relation of these past experiences to his present mental state (*autognosis*).

*Suggestion.*—The method of suggestion in the waking or sub-waking state, without hypnosis, has been re-introduced into practical psychotherapy by Emile Coué, Baudouin and others. The special characteristic of the method is that it emphasises the auto-suggestion element in all suggestion—emphasises the general fact that auto-suggestion is fundamental in all suggestion treatment, and that auto-suggestion may be encouraged, so that it takes the place of hetero-suggestion. Patients should be encouraged to treat themselves by auto-suggestion; and to do so they should put themselves into a passive state of concentration without effort (*contention*), in which state any suggestion they give to their own sub-consciousness has more opportunity of becoming realised.

*Isolation.*—Besides these more specific mental methods of treatment there are certain physical methods, which may be classed as psychotherapeutical methods, since they are devised for their mental effect upon the patient. One such method is that of isolation, applied, e.g., by Dejerine, in whose clinic isolation was often made as complete as possible. A curtain was drawn round the patient's bed, and he was allowed to see no one but the doctor. Another subsidiary method of treatment is that during the first fortnight of this isolation treatment, the patient is put upon a milk diet (*see WEIR-MITCHELL TREATMENT, 26.803*).

*Work Cure.*—The rest cure has its antithesis in a work cure advocated by some doctors, but the work cure is obviously only applicable in special cases, and where the work is congenial and does not make too large demands upon the patient's energy it should be very effective. Pottery-painting, mat-weaving, chair-making, carpentry, metal work, etc., have been found very helpful to certain types of patients. Simple mental exercises are also helpful.

*Exercises.*—Massage and relaxation exercises are sometimes important, and still more important are active exercises such as golf, riding, tennis and other games of skill, which can be a great help in getting patients back to the normal. In cases where there is a lowered psychological tension which has to be corrected the patient needs distraction and stimulation. Stimulation is also needed where a patient is so lethargic that his fatigue is due not to outgoing energy but to failure to create energy. There are some lethargic patients who will not make any effort, and suffer from not developing sufficient energy, and in these cases stimulation is needed in one form or another. Cases on the verge of severe depression, where the tendency is to sit still and do nothing, are sometimes greatly helped if they take up riding, a stimulant that can raise the psychological tension sufficiently to take them out of themselves. Motoring and motor cycling are also useful. They involve great concentration of attention, and certain types of patient obtain much help from this continuous concentration of mind, who have become so scatter-brained and distracted that they have lost the power of steady concentration. If the mind is concentrated in one direction it receives a fillip towards concentration and unification in other directions also.

*Treatment Difficulties.*—It is quite obvious that these diverse methods, many of which seem to be contrary in their results, should be recommended with discretion. Different methods are applicable to different cases, and to the same cases in different stages of illness. The practical thing in psychotherapy is, to a great extent, skill in the choice of means. Where skill can be shown is in the careful choice of means for different patients and for the same patient at different times. This is not a matter of routine, it cannot be described satisfactorily in a set of written

instructions, but it is gradually acquired by the physician in the course of practice.

**PUBLIC HEALTH** (see 22.627).—The main object should be to prevent disease rather than to cure it. The one is easy and cheap, the other difficult, expensive and often impossible. As the open air sanatorium does so much for the rickety and tubercular, this should be the model for the bringing up of all children. The open air school with the floor gently heated—as the ancient Romans heated floors by the hypocaust—should replace the indoor schools, while factories should move to garden cities as far as possible and have attached playing fields and allotments for gardening.

**Ventilation Problems.**—For air to feel fresh it must have such cooling and evaporative power as suffices to keep the head pleasantly cool and the skin free from sensible perspiration. Movement of the air is of great importance, because it prevents stagnation of air which is made warm and humid by the body and is entangled in the clothing, and greatly promotes loss of heat from the skin by convection and evaporation. In occupied rooms not contaminated by coal-gas leaks or poisonous fumes arising from manufacturing processes, natural ventilation, set up by differences of temperature inside and outside, suffices to keep the air chemically pure enough, even though all doors and windows are shut. There is normally 5 to 6% of carbon dioxide and  $14\frac{1}{2}$ % of oxygen in the depths of the lungs, and the physiological regulation of breathing is such as to keep these amounts constant. Increase of carbon dioxide or diminution of oxygen, which in the worst ventilated rooms does not amount to more than  $\frac{1}{2}$ % has then no effect.

The importance of keeping the percentage of carbon dioxide in rooms very low is to insure a ventilation sufficient to cool the body and evaporate moisture from it and to keep down the number of dust particles and microbes exhaled by carriers of catarrhal or other diseases. Most uncomfortable conditions due to heat stagnation may be found when chemical purity of the air is very high, and comfortable conditions, e.g., in a submarine cooled by the sea, when owing to long submergence chemical purity is worst. The amount of oxygen breathed in each pint of air is much lower at Alpine health resorts owing to the tenuity of the air at great heights, than in stuffy, crowded rooms in a city on the plains—a further proof, if it were wanted, that the slight diminution of oxygen percentage in such rooms is of no importance.

The commonly accepted opinion that there are chemical poisons in exhaled air has been negated by exact experiment. Stuffy air of crowded rooms is contaminated with microbes explosively exhaled from the respiratory passages in coughing, sneezing and speaking, and dust from soiled clothes. Such microbes directly inhaled by others may disseminate catarrhs, sore throats, tuberculosis of the lung, etc. The number of such microbes is very greatly reduced by open window ventilation. In several schools ventilated by the plenum system time lost by children through catarrhs was on the average six times greater than in a school ventilated by open windows. Confined air of rooms is also greatly polluted with dust stirred up by people, and in cities with soot. Some dusts, such as free silica and lead, are poisonous, and have a most deleterious effect.

The breathing of free silica dust by tin and gold miners, by sandstone, granite, and flint workers, and by gritstone grinders causes slow degeneration of the lung, ending generally in a tubercular infection. The death-rate from tuberculosis in such workers has been extremely high, and special precautions against dust must be taken

to lower it (see MINERS' PHTHISIS). The breathing of chalk, coal, and animal or vegetable dust such as bone meal and flour are relatively harmless, but may produce shortness of breath in later middle life.

Some people are hypersensitive to certain animal or vegetable dusts and get hay fever or asthma from breathing such, e.g., from dandruff of horses, dogs, cats, from dust of feathers, from pollen of grasses, from spores of moulds such as aspergillus. They are relieved by going to dust-free places as in the Alps, or to sea, or by sleeping in a special dust free room.

The inhaled air is exhaled, heated up to almost body temperature and saturated with water by the respiratory membrane. It is important for the health of this membrane that it should receive an ample supply of arterial blood and lymph, and secrete plenty of fluid to cleanse itself, with the aid of its ciliated epithelium, of dust and microbes. Cool air contains very little moisture, even when saturated, and can take up much from the lungs and so act favourably compared with the warm moist air of crowded, stuffy rooms. The natural conditions which pertain out of doors are a cool breeze moving round the head and the feet kept warm by the ground.

In stuffy, artificially heated rooms there is a draught on the floor while the head is surrounded with warm, stagnant air. As a result, the nasal membrane becomes congested, the air-way through the nose constricted, and stuffy feelings and headache are occasioned. Warming the feet and cooling the head by a fan at once relieves these feelings. While there is no evidence that "ionisation" of the air has any influence on our feeling or health, the adequate cooling of the body is most important in keeping up the tone of the muscles and the body heat production. The body should be stimulated to keep up its own heat by combustion of food, and the "fire of life" kept burning actively. Greater depth of breathing, more active circulation of blood, better appetite, digestion and absorption of food result; constipation is avoided by greater muscular tone and the deeper breathing induced by exercise taken to keep warm, and the bowels are kept clear of bacterial poisons owing to the more complete use of food, and more active circulation through and tone of their walls. General health and resistance to disease are thus promoted. Warm, moist atmospheres lower working efficiency and vigorous health. The body heat production of native students in Singapore is not more than half that of an athletic English student. The native of Singapore can do very little work. (See HEATING AND VENTILATION.)

**Food Problems.**—Ill-nutrition may arise because food is deficient in energy value or in quality, or because the environment depresses the fire of life and reduces the healthy action of the bowels and the appetite, or because the body is over-fatigued, and the expenditure of nerve energy leaves insufficient for the digestive and absorptive functions. Those who carry out in factories skilled hand operations seem more liable to illness than heavy workers, e.g., coal-miners, smiths and foundry men and agriculturists. The skilled hand-workers lead a far more caged life, using their hand muscles to make many small, fine movements, not using their big body and leg muscles, not breathing deeply, not having a high rate of food oxidation. The chest is fixed to make skilled hand movements, and this modifies their breathing. The number of fine skilled movements they have to make brings about nervous fatigue, while, their food oxidation being relatively low, and breathing shallow, the onset of fatigue is not resisted as it should be by a high rate of nutrition. The relatively warm environment brings too much blood into the skin of the factory workers, and does not tone up the body as the open air life does. Infection with catarrhal complaints is far more spread among them, and their respiratory membrane is not kept in a healthy state as it is in those who deep-breathe cool, dry air. Children who are over-crammed for examinations come under this category, so too college students and clerks. In some occupations 40% of the workers may be away from work each year for some period owing to sickness, while the number of cases seeking medical relief may number 100% of the workers or even more each year.

**Housing Problems.**—Millions live in one to three-roomed tenements, and the cinema and a sensational Press take the place of fun and frolic in the open air. The crowded life of the tenement lowers the vitality and exhausts the nervous system. Ill-feeding comes on top of this, the workers having no garden to give them fresh vegetable foods. An enormous economic loss results from their having no chance of spending their leisure hours in gardening and in improving their homes. Civilised man has to have a book some hundreds of pages long merely to catalogue his diseases. McCarrison describes in the remote Himalayas a tribe of magnificent physique, amongst whom there is no dyspepsia or neurasthenia, no gastric or duodenal ulcers, no appendicitis or mucous colitis, little or no cancer.

**Food Requirements.**—We must have in our food, first, sufficient fuel value, or energy, to keep up our body heat and to do muscular work on. Next we must have proteins which will yield us on digestion all those amino-acids into which proteins are split on digestion, which are required to build our tissue, and to secure these we want variety of both animal and vegetable proteins. Some proteins, for example, zein in maize, fail in one or other of the required constituents, and disease results from restriction to such. Then we need carbohydrates and fats, mainly to provide fuel, but also to help build body substance. In addition, we must have certain salts, and particularly chloride and phosphate of sodium, potassium, calcium and magnesium with traces of iron and iodine, on which the processes of life intimately depend. Lastly, the food must contain vitamins (*q.v.*), traces of certain vital substances which have hitherto not been separated but are known to exist by feeding experiments. The vitamins have been compared with the sparks which fire the petrol in a motor engine.

A mixed diet of fresh meat, milk, butter, eggs, fruits, honey, molasses, vegetables and wholemeal bread, such as our ancestors ate, supplied all, but now this food is largely replaced by the products of the miller and canner, by white bread and polished white rice, cornflour, sago, tapioca, tinned meat, sterilised milk, sugar, margarine made out of nuts, egg substitutes, tinned or bottled fruits. Tea, sugar, white bread, margarine, and low-quality jam are the staple foods of the very poor. The effect of preservatives and refining processes has been to lessen the vitamins and essential salts, often with disastrous effect to growth, health and breeding power. Now, the growing of salads, which might be possible in gardens and courts; in window boxes and on roofs in cities, is stopped by smoke pollution; this, too, damages the fields, gardens and allotments, and lessens the supply of vegetable food and of milk of cows fed on fresh young grass, and makes these things costly to city people (*see SMOKE PREVENTION*).

**Solar Radiation.**—The radiant energy of the sun tempered by the atmosphere keeps going the manifestations of life. Plants energised by the sun, and using, as a transformer of energy, the green chlorophyll, build up their substance out of inorganic materials. This substance is the food of the animal world. Modern theory suggests that all chemical change, vital and non-vital, is touched off by radiant energy, by light or heat; and that the speed of such change is determined by the intensity of radiation. The sun rays which are most active on living cells, killing these if too strong, are those beyond the violet; insensible to us, and called ultra-violet. These rays act also most powerfully on a sensitised photographic film. The visible rays, in part reflected from the skin, in part penetrate and are absorbed by the cutaneous blood and warm that. They are absorbed by the epidermis and scarcely penetrate to the blood beneath. The red rays penetrate through to deeper tissues and warm these.

The skin can stand, without being scorched, twice as much radiant energy per unit of time in the form of visible sun rays as it can of dark heat rays, because the visible rays largely penetrate, and, warming the blood locally, are carried away as heat to cooler parts of the body. The dark heat rays, absorbed by the surface of the skin, make us feel warm and stuffy indoors. Out of doors, on the other hand, the blood circulating in the naked skin is warmed by the sun which penetrates to it, while the surface of the skin is fanned and cooled by the breeze (*see HELIOTHERAPY*).

The biologically active ultra-violet rays are filtered off by glass. Exposure in rooms lighted by windows is not the same as exposure to light out of doors. In heating our rooms with hot water and steam pipes we expose ourselves to infra-red rays; fires give us chiefly infra-red and visible rays; incandescent electric light visible rays. A coal fire fouls the sky with smoke and cuts off sunlight; we must, therefore, take to gas or smokeless fuel fires. These and open windows give us the most healthful conditions. The dark heat of steam pipes and the stagnant warm air of shut-up rooms depress health, expose us to a more massive infection, and make us less resistant to catarrh, pneumonia, etc. Over-heating of tubercular, and particularly febrile, patients should be avoided. Exposure should not be in hot sun boxes, but in cool open air and to sky-shine or early morning direct sun.

**Sunstroke.**—Sunstroke may be caused by local heating of the head, while heat stroke results from heating the whole body through failure of the sweat mechanism. A wet sheet and a fan supplying this mechanism artificially prevent heat stroke.

Sunburn of the skin is not produced by the high sun, which on clear days contains rays with a wave-length as short as 300–295 millionths of a millimetre; but ultra-violet rays with wave-length of 310–300  $\mu$ , if intense enough, may produce severe sunburn, and it is these rays which act most in the English atmosphere, with its high content of dust, smoke and vapour. With arc lamps, probably no rays shorter than 240  $\mu$  penetrate the horny layer of the skin; but such short rays penetrate into and are absorbed by microbes and kill them.

According to modern physical theory, the ultra-violet rays act in quanta and displace electrons from their orbits in the atoms. This sets up, in living cells of the epidermis and in nerve endings which lie among these, a secondary molecular chemical action, which after a latent period produces erythema, oedema, etc. Only those rays which are absorbed by the living substance have action.

The various artificial sources of ultra-violet radiation, carbon arc, mercury vapour, lamps, etc., have an effect on the skin similar to the sun, the amount of subsequent pigmentation depending on the intensity and depth of penetration of the ultra-violet rays. The haemobactericidal power of the blood, tested *in vitro*, usually increases when the dose of ultra-violet radiation is sufficient to produce erythema. The area of skin which has to be exposed to produce this effect is not large. Excessive sunburn damage is harmful, a small amount stimulating and useful. If the body is fighting an acute disease, reactions in the skin set up by irradiation may be harmful, while most useful in chronic infections and states of debility.

The brown pigment, melanin, which forms in particles within the cells of the epidermis, acts as a screen protecting the epidermic cells and the blood from over-radiation. By absorbing and converting rays into heat, melanin brings about stimulation of the nerve endings in the epidermis, and this excites sweating, which in its turn protects from over-heating.

Some immunity to a second exposure is set up in the epidermis of a white person within a few hours after irradiation, and long before pigmentation takes place. This is due to a thickening of the horny cells, which a few days later peels off. Just after desquamation the skin is again sensitive. These facts are borne in mind when arranging the periods of light treatment. In the choice of a garment, if any is to be worn during light treatment, an artificial silk made of acetyl cellulose, thin and open-meshed, screens off least ultra-violet rays, but with even such the loss may be 50 per cent.

**Smoke Pollution.**—Window glass, clothing and smoke pollution screen off almost all ultra-violet radiation from citizens in winter, and their food is deficient in vitamins. Hence the development of rickets and depression of health in winter. Owing to smoke pollution in big cities, the ultra-violet rays are cut down to one-third of the value which pertains in clean country places.

Every effort should be made to prevent smoke pollution and to secure adequate exposure of the skin to ultra-violet rays. While securing the use of smokeless fuel, arc lamp baths should be instituted not only in hospitals but in schools and public

baths. Round a long-flame arc taking 2 to 3 kilowatts with "white flame" carbon poles (metal cored), and fitted with a wire screen a yard away, children could sit for 10 minutes, wearing only a loin cloth. Two such baths a week in winter would work great good as a preventive of rickets, tuberculosis, rheumatic fever, catarrhs, skin diseases, etc., and as a stimulator of vigour. Goggles must be worn and a trained nurse be at hand.

**Modern Hospitals.**—To build brick hospitals is out of date; all hospitals should be one-storeyed bungalows with wide verandahs. The beds can then run easily from the ward to the verandah and to the open court outside. Nurses must be suitably dressed so as to enjoy the open air life. Only receiving stations should be in cities, with ambulances to convey patients to the bungalow hospitals in the open country. Open air and ultra-violet radiation should be used to prepare patients for operation and to hasten their cure after operation. It has been asserted that artificial light treatment cannot approach heliotherapy in curative effect. By the wise use of arc lights and sufficient exposure to open air and good feeding, progressive cure of surgical tuberculosis can be brought about in winter even in our English cities. To eliminate tuberculosis from cattle, the shutting up in badly ventilated dark byres should be prohibited. Cattle no less than children might be given arc light baths in winter.

**PUBLICITY:** see ADVERTISING.

**PUBLIC SCHOOLS.**—The claim made for the public schools, using this term in the English not the American sense, that, whatever their shortcomings may be, they are at any rate successful in producing sound character and public spirit was put to a severe test on the outbreak of War in 1914 and triumphantly sustained.

Not only did the Old Boys at once join the colours in large numbers, but the boys who should have returned for another school year enlisted freely, and every public school reassembled in Sept. 1914 with numbers much depleted. Of those who served, one in every five fell, and the Rolls of Honour with striking similarity generally contain as many names as there are boys in the school. During the War, owing to the loss of many masters, and the lack of the leadership of boys over 18, the work of the schools was carried on with increasing difficulty. But their tone continued sound, and the boys maintained the standard surprisingly, considering the demands made upon their time by intensive military training and the disturbing effect of the near prospect of active service.

Contrary to general expectation, the schools emerged from the War filled to overflowing, and with waiting-lists so long that places could clearly not be found for all the aspirants. This was due to the success in leadership of boys trained in the schools, to an increased sense in the nation at large of the value of education, and particularly this form of education, and to a wider diffusion of wealth, which made possible a public school course for the sons of many who would not have been able to afford it before. Since 1918 the schools have remained full. Stowe, Canford and others have been opened to meet the demand, and there is probably room for more.

These years have seen a profound change in the curriculum and outlook of the public schools, of which the most striking sign has been the abolition of compulsory Greek at Oxford and Cambridge. This has, however, not been followed by the disappearance of classical studies (see CLASSICAL EDUCATION); on the con-

trary, they are again increasing in favour. The certificate examiners of that authority which examines most of the public schools reported 830 candidates in the summer of 1923, 981 in 1924 and 1,087 in 1925, in the school certificate only, and nearly all these are serious students. The school certificate itself is the most important development of the years under review. Its basic principle is that it is the business of the schools to give a general education in which (a) English and allied subjects, (b) a foreign language or languages, (c) mathematics and science shall be represented, though science has not established itself as a compulsory subject. It is designed for average boys of 16, and it is assumed that till then boys follow approximately the same course of study. The examination, when passed in the right subjects at a sufficient standard, admits to matriculation at the universities, and to entrance into most of the professions (see EXAMINATIONS). The new system has undoubtedly had a marked effect in improving the work of the average boy, in giving a new spirit not only to him but to his teachers, and in rendering impossible the existence of whole classes of boys, who, being without object, and without heart, were often made the reproach of the schools in the past. To bring the army examination into line with this system, candidates without a school certificate are not at present allowed to sit.

To boys above this level the schools offer to-day a greater variety of advanced courses and a greater choice of intellectual interests. Science has come greatly to the fore, and aesthetic studies, particularly music, have advanced considerably and will probably make still greater claims in the future. Though the public schools were never more popular than they are to-day, they are nevertheless segregated. Their masters stand outside the national pension scheme; they seldom transfer from school to school; the schools themselves are accessible to a limited class only. These are privileges not without their dangers. (C. N.)

**PUBLISHING** (see 22.628).—The period 1910–25 saw first a brief time of prosperity, then, during and following the World War, a decade of extreme disorganisation in book publishing. The year 1910 was a prosperous one in the book market, as publishers are apt to remember. New books and reprints were in good demand and were readily supplied under normal conditions. Four years later and those conditions were violently disarranged.

**Effects of the War.**—The World War, which raised the cost and the market value of many staple commodities, had a specifically stringent effect on book production and the book market all the world over. The book, of all manufactured articles, is most subject to the caprices of popular taste and one of the most sensitive to any change in the normal economic conditions or the ratio of supply and demand. It is not, like food and clothes, an absolute necessity, nor is it to the idle rich what a great sybarite called an "essential luxury." The process of recovery after a war does not affect books, any more than works of art, with the economic certainty that we observe in boots and shoes, for instance, or in the cotton trade. At the same time certain forms of literature, which offer an escape from actuality and the newspaper, are bound, after a war, to be in growing favour. It is interesting to examine on both counts the post-War returns of books published in Great Britain.

**Some Figures.**—In 1918, when the War ended, the number of new books printed and published was 6,750, the number of reprints 966, which together give us a total of 7,716. In 1924, six years later, the new books had risen to over 9,500, while the reprints, which had suffered badly during the War because of the cost of production and the impossibility of supplying cheap books at a profit, showed a startling recovery. They had increased to over 3,190, actually 255 volumes more than the number of reprints in the year that immediately preceded the War—1913. The total number of new books was not quite so large as in the earlier year, whose October output—a test month in book publishing because of its nearness to the Christmas season—had established a record, namely 1,699 volumes, new books and reprints included. The October return in 1924, it is significant to note, was only 180 behind that figure.

*Books in Demand.*—The increasing vogue of the reprint is remarkable. During the War a new taste for reading grew up among the soldiers who had leisure days to pass in hospital or at the base. Some millions of volumes were collected and sent over to the army huts under the auspices of various societies organised for the purpose, or under the seal of the Red Triangle. The editor of one popular series supervised the collection in London and the dispatch to France of over 2,000,000 volumes, new and old, obtained from a house-to-house canvass of the metropolis. This popularising of literature at large helped to increase the available reading public. But certain classes of books did not maintain their hold on the public when peace came again. In technology, for instance, whose manuals were specially required while the ex-soldiers were seeking work in the skilled trades, the demand fell off noticeably in the succeeding years. The analysis of books in *The English Catalogue* for 1923-4 marks a decrease in the latter year of over 100 published works in technology. In science the decrease was not very far short of that figure. History, medicine and geography also showed a decrease; on the other hand, fiction—easily first—biography, travel and guide books, including what we may call picturesque topography, poetry and the drama, religious books, sports and games and sociology all showed an increase of circulation.

#### A TEN-YEAR SURVEY

If we take a ten years' survey, we discover some curious fluctuations in the returns. In 1914 fiction came first, religion second and science third. Sociology and technology followed close. Poetry, juvenile literature, travel and topography, literature and criticism, history, biography and finally naval and military books, complete the list of a dozen sections, named in the order of their relative popularity. In 1924 fiction was still at the head. Juvenile literature had advanced from the seventh to the second place in the list. Religion was third. Science had fallen from the third to the seventh place. Poetry had advanced while technology had lost a point. Biography, thanks in part to the interest in characters and personalities who had come into prominence during the War, or because of some new reaction to its sharp stimulus, had gained markedly. It is harder to explain why, in that case, history books should have dropped in the comparative scale. Books of travel and books dealing directly or indirectly with literature had also declined slightly.

It would be easy to make too much of these differences. As between one year, or one publishing season, to another, it is necessary to allow a margin for accidental delays owing to strikes, as in the winter season of 1925-6, when the packers caused a serious break in the ordinary supply of books and periodicals, or for diversions of the public interest, as at the time of political excitement or of general elections. But after every allowance has been made, we find the yearly average in every class of book offers a very fair test of popularity. But as we note the startling preponderance of the first of those classes—fiction, especially the novel—we are driven to consider again how deceptive are the signs of success, and to recognise the notorious discrepancy between the seasonal and the permanent result.

*The Publishing of Novels.*—We have it on the authority of one large firm of London publishers, that nine out of every 10 novels published are comparative failures; that is, they show no decided profit to author or publisher. Another firm put the percentage of failures still higher, and it has been estimated that the average life of a market novel is no more than a month, and that very few survive the year of their birth. In an essay written by Andrew Lang on "The Last Fashionable Novel," he lamented that the type of story in which lords and ladies were favourite characters as during the Victorian vogue, had ceased to exist. That fall from favour serves to remind us that the novel, whether viewed as one of a group or as a single product, is the most perishable of all quasi-literary commodities, and that the producers of such books are tempted to inflate their selling value artificially. It was so when the three-volume novel was given the absurd

price of 31s. 6d. It is so when the novel is put upon the market at a net price of 7s. 6d.

#### GREAT BRITAIN AND THE UNITED STATES: A COMPARISON

The trade organ in New York that corresponds to *The Publishers' Circular* in London, namely, *The Publishers' Weekly*, does a like service in collecting annually the returns of new books and reprints that are issued from the press. In 1924 the number of new books published in the United States—or "new titles," as the register more precisely terms them—written by American authors, was 6,380. In addition, over 600 English and foreign works were printed and manufactured in America, and over 1,700 were imported. Roughly summarised, the American production, that is so far as it is comprised in the New York returns for the whole book trade, is compared with that of Great Britain in the ratio of eight to six. More to our present purpose is the comparison instituted in the *Publishers Weekly* between the book returns for 1923-4 in America with a further recast to the year 1910. There was effectively a 2% increase in 1924 over 1923, but the new titles registered in 1924 were only on a par with those of 20 years before 1904. Six years later, in 1910, the number of new titles was 11,671, or nearly double that of 1924.

As regards the comparative popularity in America of the different classes of books, in 1924 fiction was at the head of the list, but not with anything like the preponderance it showed in the British book trade. Religion came second, poetry and the drama together came third, with a total of 13 new titles more than those registered in Great Britain. Science stood relatively low in the scale and showed a decrease from the figures of the preceding year. Juvenile books, too, lost a point or two; but biography, as in the London book market at the same period, marked a distinct rise. Business books, which are rather an American speciality, also had appreciated in the scale.

#### CONDITIONS IN OTHER COUNTRIES

Certain wider questions which affect book production and the writers, publishers and sellers of books can only be treated summarily. We must turn to the *Bibliographie de la France* if we would estimate the signs of recovery in the French book market since the War. In 1923 the returns give a total of 8,784 books, a pro rata advance since 1918, steadily maintained year by year, but not so marked in recent seasons. At the same rate of progression, the returns for 1924 should give a total of books registered slightly ahead of that for the year when the War broke out—1914.

In Germany the returns are noticeably higher than in any other country, displaying a total for 1923 of over 35,000 publications. But that includes miscellaneous publications which are not counted as books in the returns for other book-producing countries. In the Italian census furnished by the *Bolletino delle Pubblicazioni Italiane*, the lists for 1921 and 1922 are relatively encouraging, and in the international scale show an unusually high percentage of educational text books and manuals. In the former year, for example, the number of works of fiction issued from the press was 580, while in social science the number was 660, and students' manuals are little behind that high figure. Poetry and the drama together number 477 volumes; religion only 206. Philology, surprising to say, stands higher than history. Philosophy is well placed, but cannot compete with the science of words. In the returns for the following year these classes preserve very much the same comparative position, but fiction and religion lose ground; history and biography gain. So do volumes dealing with the fine arts, and also those with military and naval science. Among other European returns may be noted those for Norway, Spain and Switzerland, as marking a slight advance in 1922 from the figures of the year previous.

*The Present Position.*—In the republic of books all the world over the signs are in the main encouraging, and disclose a healthy state of recovery from the War years of stagnation. In a 25 years' review and retrospect, the publishers' organ in New York pointed to several notable factors in the increased power of the

book and the widening of its market since the opening of the 20th century. The better ordering and specialising of the bookshops, the greater intelligence of the booksellers and the national development of children's libraries, have all contributed to that advance.

England might learn some practical lessons from America in these things. Nevertheless, by the establishment of such associations as the National Book Council and the Society of Bookmen she has shown herself of late years newly alive to the cordial co-operation of publishers, booksellers, authors and bookmen. A recent writer, alluding to the book fairs in Florence, Frankfurt and Paris, advocated a similar yearly event in London itself. Paris had two book fairs in 1925, one at the Universal Exposition, the other, a smaller, more specialised bibliophilic festival, was held in connection with the time-honoured Fair of Saint-Germain. Either of these might be imitated, with an English or American difference, in London or New York, with good effect in stimulating the interest of the public and the activities of the book producers and publishers.

**PUCCINI, GIACOMO** (1858–1924); Italian composer (see 22.632), died in Brussels Nov. 29 1924. His later works include *La Fanciulla del West* (The Girl of the Golden West, 1910); *La Rondine* (1916); *Il Tabarro*, *Suor Angelica* and *Gianni Schicchi* (1918). The opera *Turandot*, on which he was working at the time of his death, was finished by Sig. Franco Alfano under the direction of Sig. Toscanini, and was produced at Milan in April 1926.

**PUGILISM:** see BOXING.

**PULITZER, JOSEPH** (1847–1911), American editor and newspaper proprietor, was born in Mako, Hungary, April 10 1847. His father was Magyar-Jewish; his mother Austro-German. His father was a substantial grain merchant, who retired from business when the boy was six years old and went to Budapest to live. Here young Pulitzer was privately educated. He determined to embark upon a military career, but was excluded from the Austrian Army because of physical defects, and failed also in an attempt in Paris to join the Foreign Legion. In Hamburg, on his way home, he was induced by an American agent to emigrate to the United States as a prospective recruit for the Union Army, and on arriving in Boston harbour in Aug. or Sept. 1864 he swam ashore at night so that he, instead of the agent, might collect the enlistment bounty. Making his way to New York City, he enrolled in Company L. First New York Lincoln Cavalry, for a term of one year, and joined his regiment at Pleasant Valley, Maryland, in November. Discharged on July 7 1865 in New York City, he looked for work there but found none. In the autumn he started west for St. Louis, where he arrived penniless.

In St. Louis, with its large German population, Pulitzer's progress was rapid. While making his living by odd employments, he studied for the bar, and was admitted in 1867. On March 6 of that year he was naturalised. His studious habits and tireless energy made him known to the leading German citizens, and in 1868 he entered journalism as a reporter on the *Westliche-Post* staff. His labours as correspondent at the state capital drew his attention to politics, and in Dec. 1869, he was elected to the Lower House of the Legislature. Here he distinguished himself by leading a successful movement to reform the corrupt county government of St. Louis; and during his first month of service clashed with a county office-holder whom he shot in the leg. When the revolt against Grant led to the Liberal Republican movement in 1871–2, Pulitzer's reform zeal and his friendship for Gov. B. Gratz Brown, who in 1870 had appointed him one of the three Police Commissioners for St. Louis, made him an early adherent. He helped organise the Liberal Repub-

lican party in Missouri, and was one of the secretaries of the Cincinnati convention which succeeded in nominating Greeley for President.

As a sequel to the Liberal Republican campaign, Pulitzer entered the field of newspaper proprietorship. Some of the owners of the *Westliche-Post* sold him a share on liberal terms. This he soon resold for \$30,000, using part of the proceeds for an extended tour of Europe. On his return he executed a profitable business stroke by purchasing a moribund German daily, the St. Louis *Staats-Zeitung*, for a song, and selling its Associated Press franchise to the *Globe* for \$20,000. In 1876 he took an active share in the presidential campaign, breaking loose from all his Republican associates.

On June 19 1878 he married Miss Kate Davis, a distant relative of Jefferson Davis. On Dec. 9 of the same year he laid the foundation for his fortune by purchasing at auction the worn-out St. Louis *Dispatch*, paying \$2,500 cash and giving a \$30,000 lien. This newspaper he merged with the *Post*, owned by John A. Dillon, as the *Post-Dispatch*, which immediately began to pay and soon dominated the St. Louis evening field. It was independent in politics and devoted to hard money and tariff reform. In 1880 Pulitzer purchased Dillon's share and became sole owner. He laboured with unremitting energy, and the profits were soon running from \$40,000 to \$85,000 a year. Unfortunately in Oct. 1882 his chief editorial aid, Col. John A. Cockerill, shot and killed a lawyer, Col. Alonzo W. Slayback, in a bitter quarrel of political origin. The case did not come before the courts, but public reprobation was so great that the *Post-Dispatch* lost revenue and Pulitzer thereafter felt unwelcome in St. Louis. He departed for the East in the spring of 1883, and bought the New York *World* for \$346,000, taking possession May 10.

In 1884 he was elected to Congress from the Ninth District, a position he resigned before his term expired. Under its new management *The World* won an immediate prosperity. It was aided by a quarrel in which its rival, the *Herald*, became engaged with the newsdealers, and by the *Sun's* disastrous decision in 1884 to support Benjamin F. Butler for the Presidency. By 1886 the annual earnings of *The World* were more than \$500,000. With these resources Pulitzer in 1887 established the *Evening World*, which lost \$100,000 the first year, but by 1890 was highly profitable. William R. Hearst's purchase of the New York *Journal* in 1895 brought the *World* a powerful competitor, and it met the challenge on Feb. 10 1896 by reducing its price from two cents to one. The daily circulation of *The World* quickly rose to 300,000, and its Sunday circulation before the end of 1896 reached 623,000 copies. To *The World*, as to the *Post-Dispatch*, Pulitzer gave a tone of aggressive editorial independence. The paper earnestly supported Cleveland in his contests for the Presidency in 1884, 1888 and 1892. It was sympathetic to labour, and in 1892 took the side of the striking steel workers at Homestead, Pa. It opposed Bryan for the Presidency in 1896. A year later *The World* became an advocate of war with Spain, for Pulitzer's sympathies were warmly aroused by the Cuban struggle for liberty.

Meanwhile Pulitzer's health, always precarious, had in 1889 become so bad that specialists forbade him to continue his daily editorial labours. The following year his eyesight suddenly failed him, and his vision thereafter was dim and uncertain. His nerves also were shattered, and he suffered from hardening of the arteries. Though compelled to live the secluded existence of an invalid, he kept in intimate touch with *The World* and exercised absolute control over its policies until within a few weeks of his death, in Charleston, S.C., Oct. 29 1911.

During his lifetime Pulitzer had given liberally. In 1903 he endowed the School of Journalism of Columbia University, opened in 1912. In his will he established a series of prizes, to be awarded annually, in the interests of letters, the drama, music and newspaper work, and bequeathed sums for other purposes. These are known as the Pulitzer prizes.

**PUMPS** (see 22.645).—The principal developments in the science of pumping since the year 1910 consist mainly in improvements in the design of the centrifugal and reciprocating pumps for pumping large volumes of water and sewage, the special forms of pumps for pumping crude and refined oils and petrol due to the rapid growth of the motor and fuel oil industries, improvements in pumps for handling highly viscous substances such as tar, glycerine and molasses, and in pumps for dealing with highly corrosive substances, mine waters and liquors used in the treatment of ores for the extraction of metals.

*Large Volume Pumps.*—For pumping, the centrifugal pump is practically universal. The high-pressure turbine pump has undergone considerable development in simplicity of construction, ease of manufacture and efficiency and an enormous increase in the pressures involved. A turbine pump has been produced to replace the three-throw hydraulic ram pump with the accumulator. The pumping of boiler feed water has resulted in the production of the long-stroke pump, which has gradually given way to the turbine pump, where a single pump can be used, to pump hot water at different pressures to suit different boilers. The turbine pump is now made in two distinct varieties, the non-regulating type and the regulating type. The rotorbo and sunturbo pumps automatically prevent the sudden demand for power when the load is taken off. The turbine pump is employed for deep well pumping, but difficulties arise chiefly from the confined nature of the space into which the pumps are placed and to the impossibility of using oil for lubricating the bearings. The problem of designing bearings for this type of pump cannot as yet be said to have been solved. Such bearings are lined with lignum vitae, or various forms of rubber.

*The Pumping of Oil.*—The first successful oil pump, introduced by Worthington, is characterised by its lost motion device. It is now employed in most industries for occasional work where certainty of operation is required without skilled attention. Most of the successful oil pumps are of the reciprocating type, designed more or less on the Worthington principle. As oil is viscous and its resistance to flow is greatly affected by temperature, the pumps are designed with very large valve chambers and provided with steam cylinders capable of coping with the high pressures necessary. The rotary pump has been considerably developed for this class of work.

The pumping of hot oils during the process of refining has produced several special forms of pumps. In one type the hot oil does not enter the actual pumping cylinder, but a buffer of cold oil separates the working cylinder from the valve box. The difficulties in pumping petrol lie in its extreme limpidity in contrast with the high viscosity of fuel and crude oils. The semi-rotary and the rotary pumps are common forms for this purpose. The roadside pump is a modern feature and is designed to deliver measured quantities of, say, 1 to 25 gal. to motor cars on the road. The convenience of obtaining petrol in this manner is sufficient to overcome the inaccuracies of the methods employed, to correct which improvements are being made. One ingenious roadside pump uses the pressure of a high level water tank to force the petrol through an ordinary water meter into the purchasers' tanks. This method avoids loss due to evaporation and the danger of fire. Displacement systems for handling inflammable liquids in order to reduce the fire risks have been developed.

The pumping of oils from mines is a recognised difficult operation. It is usual to bale out oil from a deep well, but it is now possible to pump sand and oil without the danger of the sand eroding the pump barrel. In one form of pump the valves lie deep down among the sand-laden oil, and the pump barrel itself, operated by mechanism at the top, works in a buffer of clean water and oil.

*Corrosive Liquids.*—Before 1910 the ordinary acid egg was almost the universal appliance for raising corrosive liquids, and improvements in pumping first showed themselves in attempts to make the acid egg an automatic and self-acting machine. In spite of several automatic elevators it cannot be said that this method of pumping is a success. Then came the acid resisting alloys of the iron silicon type. Many pumps were made

of these alloys, but owing to the high cost and the brittle character of the alloy success was limited. A distinct advance was the use of an ordinary pump acting on an inert substance which separated the acid to be pumped from the working mechanism, such as the Ferraris, in which a buffer of mineral oil is used. Leakage at the gland of an acid pump must be avoided and many attempts have been made to produce a glandless pump.

In one type the resistance of an annular film of acid round the pump rod is relied upon to control leakage within small limits, suitable means being taken to collect the flow and return it to the suction side of the pump. The use of ebonite for making pumps has undergone very little change. Diaphragm pumps separating the working mechanism from the acid side have not shown much development. Improvements in the compounding of rubber enable the design of a bellows pump free from all gland leakage to be perfected. The centrifugal pump for corrosives is made of lead and some forms are lined with rubber and ebonite. An ingenious earthenware acid pump, made of a mixture capable of resisting heat, has been produced. The acid-egg type of pump has been adopted for pumping sewage in level districts. The apparatus works automatically and can be left for long intervals without attention. For pumping acid fumes the Nash-Hytor pump consists of a rotor working in an elliptical chamber and so arranged that the inlet and outlet sides are separated by a layer of water, which is kept to the surface of the chamber by the centrifugal action set up by the rotor, no valves being necessary. It is being used to compress air for operating the sewage ejector pumps in the streets.

The pumping of solid-laden liquids has been successfully accomplished by the Gwynne-Pennell trap, in which the solids are ingeniously trapped and conveyed to the suction side without having to pass through the pump. Constantinesco uses a rapidly operated pump for the production of waves in any fluid in a closed system for the transmission of power from point to point (see TRANSMISSION GEAR, VARIABLE). First used for firing a gun on the Fokker plane, its use has been extended to the working of rock drills in mines.

*Air-lift.*—The air-lift has received considerable attention. In an extensive series of tests made on a mine in California efficiencies of 70% were obtained. The researches of Dr. Owen, investigated by Swindin, show that the air-lift has possibilities of high efficiencies provided care is paid to the correct design of the footpiece. The use of the air-lift for pumping molten metals is progressing and its action is seen in the latest type of submerged flame burner. In an ingenious form of chain pump, a development of the old rope pump, by the application of the principle of surface tension a series of cells attached to a travelling band can be filled with water. A curious combination of the displacement pump has recently appeared under the name of the "Hydrautomat," in which a large quantity of water falling through a short distance raises a portion of itself to some greater height. It performs the same function as the well-known hydraulic ram and works by alternately compressing and exhausting air in a series of containers. Michell's studies in lubrication have revived the old washplate, and pumps having this as a vital element are now appearing. Pumping by direct explosion of a combustible mixture in contact with the water has been the subject of investigations by Humphrey.

In the artificial silk industry (see ARTIFICIAL SILK) special small pumps are used; usually small rotary appliances similar to the sud pump on automatic machine tools are used for squirting viscose solutions through the dies into the coagulating bath.

*Pipe-lines, etc.*—Much ingenuity has been shown in the study of pipe-lines, tubes, hose and the manner of making joints. The difficulty of making a satisfactory joint in a pipe for petrol still attracts inventors. The best known method at present seems to be to use metal-to-metal joints and to rely on extreme good workmanship. Joints in the large mains are made by means of screwed couplings made to gauge. Petrol hose is now manufactured and some forms consist of a metallic lining reinforced with rubber and canvas. The "Victaulic" joint has rendered possible the making of pressure and vacuum tight joints at low

cost and with great ease. Slight irregularities in the alignment of pipes do not affect this type of joint.

*Theory.*—On the theoretical side the Reynolds-Stanton law of viscous flow has been developed in a form suitable for use by ordinary hydraulic and chemical engineers. Dr. Ing. Bruno Eck has applied the theory of aeroplane lift and drag (Lanchester and Prandtl) to the design of turbine and centrifugal pumps. The theory and practice of centrifugal and turbine pumps are at variance and cannot be reconciled by the old hydrodynamic theories, but Eck has shown that the streamline theory of Lanchester and Prandtl can be applied to the working of these pumps and thus account for the divergencies. The older theory depended upon the principle of a non-viscid frictionless fluid, but the Reynolds theory and its extension by Prandtl have put the element of viscosity into the theory with the result that the performance of centrifugal pumps can be explained on theoretical grounds. Much light has been thrown on this subject by the researches of Camichel and M. M. L. Escande and M. Ricaud at the Toulouse University, who have rendered visible the streamlines, thus facilitating enormously the ease of study. Photographic study of the problem is also being made by Prasil and Oertli at Zürich. Photographs of streamlines round the impeller blades of a turbine pump reveal the causes of the loss of efficiency. Reference should be made to the work of Prof. Th. von Kármán and his methods of turbine design. In his view turbine design is much more difficult than the study of the correct design of an aeroplane wing.

**PUNISHMENT** (see 22.653a).—Punishment is the deliberate infliction of suffering on a wrongdoer. Originating in the prim-

itive lust for reprisal for an injury suffered, it has been rationalised into a well-nigh universal conviction that it is the best if not the only means of bringing the sinner to repentance.

The new psychology, which sees deeper roots than naughtiness or wickedness in childish wilfulness and adult criminality, is doing something to undermine this faith in the universal efficacy of punishment. Wrongdoing must be corrected, but the correctional treatment must be based on a diagnosis of the individual. If the misconduct is due to invincible ignorance or to a neurotic constitution or to a morbid emotional state, the infliction of punishment may only aggravate the underlying cause of the objectionable behaviour. Perhaps in any case there is a wiser alternative to punishment.

In the treatment of the criminal, as in that of the child, the concept of punitive justice still dominates action and feeling. To the common mind justice is punishment. This sentiment gains powerful support from a modern school of philosophic thought which maintains that it is only by the punishment of the offender that human society can maintain its moral integrity, a view which finds its most dramatic expression in the words of the late Mr. Justice Fitzjames Stephen in his *History of the Criminal Law in England*, to the effect that it is morally right to hate the criminal and that exemplary punishments are necessary to express and confirm that hatred.

The popular attitude is further reinforced by an undying faith in the deterrent effects of hard legal penalties. In the United States, at least, Beccaria's maxim, that it is not the severity but the swiftness and certainty of punishment that gives it its deterrent effect, falls on deaf ears. We seek by severity to compensate for the discreditable delays and uncertainties of our criminal justice. It is in England, perhaps, more nearly than in any other country, that Beccaria's principle is being reasonably applied.

The great humanitarian tradition which was born of Beccaria's epoch-making pamphlet and forwarded by the heroic labours of Romilly, Bentham and Howard, has, in England, achieved the all but complete abolition of the death penalty and a general mitigation of prison sentences. But, while the same generous sentiment has, since the coming of William Penn, never failed to command distinguished support in America, it has apparently been far less effective in America than in England. Here the county jail of John Howard still survives, and in many American states such crimes as rape, arson, robbery and burglary, as well as murder, are still punishable by death. Consonant with these survivals is the extent to which the infliction of punishments is left to the arbitrary and capricious discretion of the judges, who frequently impose sentences of incredible severity on offenders convicted of the more serious offences. Sentences of 10, 20, 30 and even 60 years are not infrequently imposed on offenders who in England would rarely receive more than the statutory term of five years.

But in the United States, as in the England of Romilly and Bentham, humanitarianism has its illogical but effective revenge. As in that older day when, in the mother country, the multitudinous death penalty hung in the balance, there is at present in the United States the scandalous spectacle of prosecuting officers compromising with the offender, of witnesses disappearing between indictment and trial, of juries refusing to convict, of appellate courts resorting to tricky technicalities to reverse a judgment of conviction and of governors exercising the pardoning power like spendthrifts. "Thus," as Romilly says, "the law defeats its own ends and becomes the abettor of its own violation." Punishments must be brought into conformity with the conscience of the people.

**PUNJAB, UNIVERSITY OF THE** (see 22.655).—Since 1919 in conformity with the wise policy of developing higher teaching the university, which had mainly been concerned with examinations, has instituted honours schools in Arabic, Persian, Sanskrit, botany, zoology, mathematics and chemistry. Nineteen Institutions are affiliated to it in medicine, education, agriculture, arts and science. In 1924 the chemical laboratory, which cost Rs. 450,000, was completed.

**PUPIN, MICHAEL IDVORSKY** (1858– ), American inventor, was born in Idvor, Hungary, Oct. 4 1858. He went to America in 1874, and graduated from Columbia University in 1883. The first to hold the John Tyndall fellowship at Columbia 1886–8, he later studied physics and mathematics at Cambridge University and under Von Helmholtz at the University of Berlin (Ph.D., 1889). He was instructor in mathematical physics, at Columbia, 1890; and was appointed adjunct professor of mechanics, 1892, becoming professor of electro-mechanics there in 1901 and later director of the Phoenix research laboratories. By means of inductance coils placed at predetermined intervals of the transmitting wire, he greatly extended the range of long-distance telephony, particularly over telephone cables. The patent for this invention was acquired in 1901 by the Bell Telephone Co. and by German telephone interests. He has made several other inventions in electrical wave propagation, electrical resonance and multiplex telegraphy. He discovered secondary X-ray radiation in 1896 and invented in the same year means for short exposure X-ray photography by the interposition of a fluorescent screen. He was active during the World War aiding Serbia and the United States. He wrote *From Immigrant to Inventor* (1923).

**PUTNIK, RADOMIR** (1847–1917), Serbian general, was born on Jan. 25 1847 at Kraguyevats. Like many other prominent figures in the life of his country, he came of a family which had emigrated to the Banat during the Turkish conquest and returned to Serbia after the expulsion of the Turks. Passing through the military school at Belgrade (which afterwards became the Serbian military academy), he obtained his commission in a line regiment. In 1876 he commanded a brigade in the war against Turkey, and when war was renewed in 1877 became

chief-of-staff of the Shumaja Division. In the Serbo-Bulgarian War of 1885 he held a similar post in the Danubian Division, and in 1889 was made deputy-chief of the general staff, and taught as professor at the military academy in Belgrade. In common with other brilliant officers, he suffered from the favouritism which Kings Milan and Alexander had introduced into the Serbian Army and from the consequent atmosphere of intrigue and personal rivalry. He was placed on the retired list, and it was only after the military revolution which destroyed the Obrenović dynasty in 1903 that he obtained his real opportunity of service. In that autumn he was appointed general and chief of the general staff. In 1906 he succeeded Gen. Gruič as Minister of War, and again held that office in 1912, during the period when the military convention with Bulgaria was negotiated.

On the outbreak of war with Turkey Putnik was made *voivode* or marshal (being the first holder of that title) and commander-in-chief, and was responsible for the rapid success of the Serbian arms at Kumanovo, Prilep and Monastir. It was largely owing to his vigilance and foresight that the treacherous night attack by which the Bulgarians opened the second Balkan War (June 29 1913) was so complete a failure; and the battle of the Bregalnitsa was won. When the World War broke out, he was undergoing a cure at an Austrian watering place, and was at first placed under arrest, being later released by special order of the Emperor Francis Joseph and conveyed to the Rumanian frontier. His impaired health did not prevent him from resuming the position of Serbian generalissimo and he inflicted upon the forces of Gen. Potiorek three successive defeats—the battles of the Yadar (Aug. 16–20), of the Drina (Sept. 8–19) and of Rudnik, which ended on Dec. 14 1914 with an Austrian rout and the complete evacuation of Serbia. Putnik retained the supreme command during the triple invasion of Serbia by the German, Austro-Hungarian and Bulgarian Armies in Nov. 1915, and shared the retreat of the Serbs through Albania. When, however, the exiled Government established itself at Corfu, he and most of his staff were placed on the retired list. He himself withdrew to France. He died on May 17 1917 at Nice.

**PYLE, HOWARD** (1853–1911), American artist and writer (see 22.679), died in Florence, Italy, Nov. 9 1911.

**QUANTUM THEORY.**—The quantum theory is essentially a theory based upon the assumption that changes in a system with periodic motion are finite in magnitude, the steps being governed by empirical quantum rules, and the energy changes being in general multiples of a quantum of energy  $h\nu$ , where  $h$  is a constant (Planck's constant) and  $\nu$  is the frequency of the (or an) associated motion. Previous to its formulation it was thought that the energy of a vibrating electron or of a vibrating atom, the energy of radiation emitted or absorbed by an electron or by an atom, might have any value whatever. Changes were regarded as taking place continuously and in infinitesimal amounts.

The quantum theory, on the other hand, as far as it goes, assumes that any change when once it starts is not terminated until the transfer of a full quantum of energy is effected. The time necessary is very minute, but neither this nor the mechanism of the operation is known. If observed sufficiently minutely the process might, of course, appear as a continuous change, but by reason of its suddenness and the inevitable nature of its conclusion, it is spoken of as a discontinuity. The continuities of the classical theory are thus on the Quantum Theory replaced by so-called discontinuities. Such rules certainly apply to changes of a definite kind, but to regard them as universal in their application is a faith rather than a rational doctrine, for the evidence is that these rules are definitely limited in their application.

**Heat Radiation.**—The theory originated in an attempt by Planck to explain the constitution of heat radiation, *i.e.*, to explain the distribution of energy among the constituent wave-lengths in the radiation proceeding from hot "black bodies." Classical theory has failed to do this, notably in that the possibility of continuous interchange of energy between vibrations in matter and vibrations (waves) in the surrounding ether, as assumed in the classical theory, could only result in the continuous pouring of energy into the ether with its infinite possibility of vibrations. This would happen even in a small volume of ether enclosed by matter; whereas experiment seems to show that an equilibrium state is arrived at, when the energy transferred from matter to the enclosed ether is just balanced by the transfer of energy from the ether to matter. The enclosed radiation is then said to be at the temperature of the surrounding matter, *i.e.*, there is statistical equilibrium with that matter.

More precisely, as Rayleigh and Jeans showed, the energy stored at absolute temperature  $T$  in unit volume of the ether in the forms of waves of length between  $\lambda$  and  $\lambda + d\lambda$  should be expressed by  $8\pi k T \lambda^{-4} d\lambda$ , that is  $kT$  for each of the  $8\pi \lambda^{-4} d\lambda$  independent vibrations, where  $\frac{1}{2}kT$  is the average energy of monatomic molecules of a perfect gas at temperature  $T$ , *i.e.*,  $\frac{1}{2}kT$  for each degree of freedom. This expression shows that the greatest amount of energy would be found in the radiations of shortest wave-lengths. But measurement of the energy (by its heating effect) for a given small range of wave-length throughout the spectrum shows a definite maximum and a falling off in energy for both shorter and longer waves (Lummer and Pringsheim).

Endeavouring to find a system giving closer agreement with experiments, Planck assumed that the oscillators in matter which emit heat radiation (electric waves) contain energy in definite quanta, the indivisible unit of energy in an oscillator being proportional to its frequency of oscillation, *i.e.*,  $E = h\nu$ . This unit, however, varies for oscillators of different frequency. What is fundamental to all is the constant  $h$ —a quantity which, divided by the period of oscillation, gives the energy unit. Planck's indivisible constant is thus a quantum of "action"—a quantity of the dimensions of angular momentum. The quantum of energy, however, may be infinitely small, if the frequency is infinitely small, so is not fundamentally atomic.

Imposing such an imaginary condition changes the average energy of an oscillator from  $kT$  to  $kT \frac{h\nu/kT}{e^{h\nu/kT} - 1}$ , *i.e.*,  $\frac{h\nu}{e^{h\nu/kT} - 1}$ , with

the result that the energy with the given range of wave-lengths  $d\lambda$  becomes  $8\pi \lambda^{-4} \frac{h\nu}{e^{h\nu/kT} - 1} d\lambda$ . This was found to agree almost

perfectly with the distribution of energy in the spectrum as found by Lummer and Pringsheim. The same formula has since been obtained from somewhat different assumptions, as by Planck assuming continuous absorption but quantum emission; by Einstein on the hypothesis that *changes of energy in a molecule are only possible by a jump from one definite state to another, involving the absorption or liberation of energy equal to the difference between the energies of these states though these energies are not necessarily in quanta; others assume that an integral number of quanta exist in the radiation itself. But in general there appears somewhere the assumption of "discontinuities"; and Poincaré has shown that the experimental distribution of energy can be satisfied only by quantum laws.*

By comparison of the formula with experiment,  $h$  is found to be  $6.55 \times 10^{-27}$  erg  $\times$  second. This gives the value for a quantum of energy of visible light, say sodium light, as equal to the kinetic energy of 60 atoms of monatomic gas at  $0^\circ\text{C}$ . and equal to the vibrational energy of about two atoms of a solid heated to emit yellow light most strongly. Thus the quantum laws, while necessary and successful in explaining the features of black-body radiation, do not indicate the mechanism of an energy change. That the process of heat radiation should be explosive in nature and should occur in amounts  $h\nu$  was certainly new and startling but not necessarily so revolutionary as to preclude the possibility of the process being perfectly continuous.

**Specific Heat.**—The application of the quantum rules in the apparently unpromising region of the heat content of bodies themselves, particularly of solids, has had marked success. Thus, observations show that the heat necessary to raise unit mass of an elementary substance through one degree of temperature (the specific heat) varies approximately inversely as the atomic weight of the element (Dulong and Petit's law). This expresses the fact that the average heat absorbed per atom is independent of the mass of the atom. In addition, the heat absorbed per atom is found to be double that absorbed per atom of monatomic gas. This is explained by assuming that each atom of the solid is capable only of vibration as a whole, the average energy being double that for a monatomic gas on account of the potential energy of vibration being equal to the kinetic energy determining the temperature. Thus  $N$  atoms of monatomic gas at absolute temperature  $T$  possess energy  $\frac{3}{2}NkT$ , and  $N$  atoms of a solid possess energy  $3NkT$  where  $k$  is the molecular gas constant. The approximate laws are therefore in accord with the classical theory. It had been observed, however, that light elements as boron, diamond and silicon, especially at low temperatures, have a much lower specific heat than is given by the above law. Nernst and Lindemann more recently found that the specific heat of *all* substances diminishes rapidly at low temperatures, and this is most marked in light substances. But, as Einstein showed, if the energy of vibration of atoms is governed by quantum laws the average energy of atoms depends on this frequency of vibration

( $\nu$ ) and the total energy becomes  $3N \frac{h\nu}{e^{\frac{h\nu}{kT}} - 1}$ . From this it

follows that the specific heat diminishes with temperature in a manner similar to that found by experiment. The agreement, however, is not close.

A great advance was made by Debye by regarding the motions of all the atoms as due to superposed systems of waves through the solid—waves of compression and waves of distortion. He assumed each independent vibration into which the whole motion

could be resolved had energy  $\frac{h\nu}{e^{\frac{h\nu}{kT}} - 1}$  as given by the

quantum laws above, and limited the number of such vibrations to the number of degrees of freedom of the constituent atoms. But the frequency equals velocity ÷ wave-length, and as the velocity of waves depends upon elastic constants of the solid, these constants were introduced into the expression for the specific heat. Quite good agreement was found between the calculated and the experimental results, and it was shown that at very low temperatures the specific heat  $c_v$  should vary as the (absolute temperature), a result which was experimentally confirmed by Kamerlingh Onnes for temperatures approaching absolute zero.

Further, the variation in the specific heat of gases, particularly diatomic gases, has been explained in qualified measure, by assuming that changes both in vibrational and rotational energy take place in precise quantities.

*Spectra.*—The greatest triumph of the Quantum Theory, however, is in its application to spectra, especially those of the simplest atoms hydrogen and helium. Rutherford had given good reasons for his theory that an atom consists of a highly concentrated positively charged nucleus, with negative electrons circulating around it, and that the positive charge of the nucleus, expressed in fundamental units and the number of negative electrons outside, were alike and equal to the atomic number, viz.: for hydrogen 1, helium 2, lithium 3. According to classical laws, if an electron rotates—if it is accelerated in any way—it emits a radiation in the form of electric waves, and by emission of energy its own energy diminishes. Such an electron would thus approach nearer to the nucleus and its frequency of rotation would gradually increase. From a large number of atoms in different states, the frequencies would have all values between wide limits. This is contrary to experimental fact, for the line spectra of substances indicate definite unchanging frequencies, with wide intervals between, for which no frequencies are observed. Here evidently was a chance for a quantum theory such as Bohr provided in his quantum atom. First considering the hydrogen-like atom consisting of a positive nucleus with one electron rotating around it, he boldly assumed the following important facts:—

that the electron obeys the ordinary dynamical laws during rotation in the circular orbit round the nucleus but does not radiate;

that the orbit may change suddenly to an inner orbit of smaller energy;

that when it does so change the mechanical energy lost is all emitted as monochromatic radiation;

that the frequency of the radiation is governed by the quantum laws, i.e.,  $E_1 - E_2 = h\nu$ , where  $E_1$  and  $E_2$  are the energies in the initial and final orbits;

finally, that the possible orbits are limited to those in which the angular momentum is an integral multiple  $\tau$  of the constant  $h/2\pi$ .

This is equivalent to postulating an integral number of fundamental units of magnetic induction linked with the orbits (H. S. Allen).

These assumed numerical relations limiting the orbits and governing the frequency, combined with the simple dynamics of a

rotating particle, give the radius of the circular orbit as  $\frac{\tau^2 h^2}{4\pi^2 m e e}$

where  $m$  is the mass of the electron and  $e$  the electric charge on the nucleus of the atom. Thus, only orbits of radii proportional to  $\tau^2$ , i.e.,  $1^2, 2^2, 3^2$ , etc., are possible. And the frequency  $\nu$  of the radiation is given by  $\nu = \frac{2\pi^2 m e^2 e^2}{h^3} \left( \frac{1}{\tau_2^2} - \frac{1}{\tau_1^2} \right)$  where  $\tau_1$  and  $\tau_2$  are the

integers—the quantum numbers for the initial and final orbits. Thus, also, only certain frequencies of radiation are possible. Corresponding, for instance, to the fall of an electron from the 3rd, 4th or 5th orbits into the 2nd orbit the frequency of radiation is

$\frac{2\pi^2 m e^2 e^2}{h^3} \left( \frac{1}{2^2} - \frac{1}{3^2}, \frac{1}{2^2} - \frac{1}{4^2}, \frac{1}{2^2} - \frac{1}{5^2}, \text{etc.} \right)$ . As for the hydrogen atom  $e = e$ , all the quantities in the above expression are known from independent measurements, and the theoretical frequencies of the spectral lines may be calculated with considerable precision.

Such a series of lines as the above is the well-known Balmer series. Other series of lines corresponding to the falls from outer

orbits into those of quantum numbers 1, 3 and 4 have since been observed. The constant  $\frac{2\pi^2 m e^4}{h^3}$ , as calculated, agrees perfectly

with the Rydberg constant which was found from spectroscopic observations long before the theory was put forward. Similarly, spectral lines due to ionised helium, i.e., helium atoms with a nuclear charge  $2e$ , with one electron rotating around it, have frequencies found by writing  $e = 2e$  in the above formula.

A remarkable extension of Bohr's theory was made by Sommerfeld by assuming that the electronic orbits are in general elliptical in shape, like those of the planets round the sun with the nucleus at the focus. In this case, however, each orbit needs two quantum numbers to define it, one radial, the other azimuthal, the total quantum number being the sum of the two. This does not affect the above expressions for the frequency of the emitted radiation if  $\tau_1$  and  $\tau_2$  stand for the total quantum numbers, but it provides the possibility for a given spectral line being produced by the fall of the electron both from and to various alternative elliptical orbits. Owing, however, to the relativity variation of mass with velocity, the energy of an electron in two orbits of the same total quantum number differs slightly, with the consequence that the change of energy from orbit to orbit, and thus the frequency of emitted radiation differs slightly among the various members of the system with the same initial and final total quantum numbers. Each spectral line as given by the simpler theory therefore consists of a number of neighbouring spectral lines. Such a fine structure of the lines has been observed by instruments of high resolving power in the spectrum of hydrogen, and the theory has been beautifully confirmed from measurements of the more clearly separated lines of the helium spectrum.

The further extension of the theory of spectra to more complicated cases is in general based upon the hypotheses of (a) stationary states or energy levels, (b) Bohr's relation  $h\nu = E_1 - E_2$  for the frequency of the radiation emitted in transition from one state to another, (c) a general quantising relation applied to each degree of freedom to determine the possible states (expressed  $\oint p dq = Th$ , where  $q$  is a generalised co-ordinate and  $p$  the corresponding momentum). A "principle of selection" is also introduced permitting only certain transitions between the stationary states regarded as possible by the quantising rules. The selection principle or "principle of correspondence" of Bohr assumes that for high quantum numbers the results obtained from the Quantum Theory for radiation emitted during transition must merge into those obtained from the classical theory for radiation emitted during orbital motion.

The effects of both electric and magnetic fields on the radiating atoms (Stark and Zeeman effects) can then be very satisfactorily explained.

Applications to X-ray spectra similar in nature have also had marked success.

Bohr's theory of the atom was, of course, designed to agree with experiment, yet the assumptions made were simple and of a very general nature. To explain the complexity of spectra in great detail by such simple postulates, is an achievement which seems to indicate for the model some approximation to reality. Yet it is merely a skeleton atom; the postulates are a convenient summary of certain properties; they give no indication of the physical processes by which the observed conclusions are reached; indeed, there is little doubt that the actual atom has not the rigid or precise configuration which the model demands (see ATOM).

Whether the quantum phenomena will ever be explained without the discovery of further properties of electricity to supplement those on which classical theory has been built is questionable. Useful though the quantum rules are, their application has appeared to suffer from an inconsistency which success alone could partially justify. A new theory has, however, been formulated by Heisenberg which, whether fruitful or not, promises to put quantum mechanics in much more logical form. Its physical significance, however, is not apparent. To the physicist, quantum theory needs an infusion of new and simple experimental facts such as will, without doubt, be obtained in the near future.

*Emission and Absorption of Radiation.*—The most intimate acquaintance with the quantum rules is made in a study of the processes of excitation and of absorption of X-rays and of light, especially the former. Thus, when X-rays are produced by shooting electrons onto a target (anticathode), radiation of a particular frequency  $\nu$  appears in the spectrum only when the kinetic energy of the generating electron is equal to or greater than one quantum of the radiation i.e.,  $\frac{1}{2}mv^2 \geq h\nu$ .  $\nu = \frac{\frac{1}{2}mv^2}{h}$  is the limiting

frequency. The emission of light of frequency  $\nu$  characteristic of a vapour, say mercury, can also be produced by the impact of electrons with energy  $\frac{1}{2}mv^2$  equal to  $h\nu$ , but not by more slowly moving electrons. To excite a characteristic X-radiation, consisting of a group of spectral lines,  $\frac{1}{2}mv^2$  must be just greater than one quantum of the highest frequency constituent. These relations seem to indicate that one electron generates one quantum of radiation. On Bohr's theory this is interpreted as that the energy of the moving electron must be sufficient to displace an electron in the atom from one orbit to another of greater energy. When this falls back, this energy is re-emitted as one quantum of radiation. To excite characteristic X-rays an electron must be moved from an inner ring, not to the next possible orbit, which is already occupied by other electrons, but to the surface of the atom; and various frequencies are produced by electrons falling back from other energy levels.

Conversely, when X-radiation of frequency  $\nu$  is absorbed it ejects electrons which, when measured have energies  $\frac{1}{2}mv^2$  varying from  $h\nu$  downwards, but with a number of well-defined energies  $h\nu - E_n$  where  $E_n$  has one of a number of possible values for any particular element, being on Bohr's scheme the energy necessary to raise the electron from a definite energy level to the surface of the atom. It is presumed that all other velocities obtained are due to loss of energy in escaping from the material experimented upon. (There is some doubt of this when  $E_n$  is almost equal to  $h\nu$ .)

The fact that the energy  $h\nu$  must be put into an atom to produce radiation of frequency  $\nu$ , and that an equal amount should reappear in an absorbing atom, is not so startling as that the number of these energy units should seem to be the same. Thus, the number of high-speed electrons ejected by a given beam has been found independent of distance from the source, independent of the absorbing substance, and unaffected even by the radiation being almost completely scattered in all directions. Also, there is strong evidence that the number of electrons ejected by a characteristic X-radiation is equal to the number of atoms which emitted that radiation; and more particularly that one quantum of radiation from one atom can be visibly effective in only one atom, as appears from C. T. R. Wilson's condensation experiments. This suggests either that a spherical wave-train emitted by an atom (in the classical theory) is effective along only one definite ray, or alternatively that absorption at any point renders the remainder ineffective. The latter is not in agreement with experiment when many such trains are present.

Such evidence leads directly to a quantum theory of radiation which postulates the existence of discrete particles of radiation, each moving along a single continuous path—J. J. Thomson's waves along discrete tubes of force, Einstein's light quanta, and J. J. Thomson's recent combined quantum-wave theory.

On the other hand, the phenomena of scattering of X-rays and light, including all the interference phenomena of scattered radiations, are explicable only on the assumption that the potential activity of a wave spreads out in all directions. The energy, the distribution and the polarisation of the scattered X-rays are all precisely as predicted in the classical spreading wave theory and on no other. The theory is that every extra-nuclear electron in the matter traversed contributes its share of scattering not in quanta, but in almost infinitesimal amounts. The electrons, even in the quantum-atom, are thus radiators on the classical theory when the energy is supplied to them by the primary radiation and leaves the energy of the atom untapped. The "quantum theory of scattering" (unfortunately named) has been given by A. H. Compton to explain not scattering but the production

of a second (displaced) spectral line sometimes observed with the scattered X-radiation. He applies the principles of the conservation of energy and of momentum to an incident quantum of radiation which, on encountering an atom, ejects an electron and causes the emission of a quantum of secondary radiation. This, having less energy than the incident quantum, has lower frequency for  $\nu_2 = \frac{E_2}{h}$ . If such a phenomenon actually occurs it is

certainly subject to some unidentified condition (compare Barkla's J phenomenon with Compton's quantum scattering theory). Also, the phenomena of reflexion or diffraction of X-rays by crystals show that the secondary waves are not effective except in certain definite directions in which waves would be expected to reinforce one another. Where waves interfere, there the effects of radiation disappear. (Similarly, in optical interference phenomena in which complicated intensity distribution is involved.) It is what may be called microscopic examination which shows definite amounts of energy to appear only at certain points, and the problem is to show how it arrives there in quantities much greater than is carried by the waves passing over the absorbing atom.

A natural assumption to make is that when an atom reaches a certain unstable state the properties of the surrounding medium are completely changed and energy pours into the atom from the surrounding region. Theory makes no provision for this; nor is this surprising, for this is an unexplored region in which anything may happen. The subject is one for experimental study.

But already we know—(J phenomenon)—that quanta of radiation are not independent entities in radiation, for a slight addition to, or a slight elimination from, a complex X-radiation completely changes the electron emission and absorption of that radiation. Thus a quantum of radiation does not operate alone. There is thus neither need for, nor is there any room for a quantum of radiation as a distinct entity in addition to a quantum-atom. Assuming the quantisation of electronic orbits or its equivalent, it is but a short step to the quantisation of atomic vibrations, for the bonds holding an atom are electronic bonds: quantised vibrations are probably inevitable. But the conception of the rotational energy of a molecule changing in the precise way governed by quantum rules is a difficult one, unless the duration of the energy transfer is at least comparable with the period of molecular rotation. Though many other applications of quantum laws have been attempted, and with varying success, they contribute little to fundamental knowledge. The atom is certainly a quantum-atom; its internal structure and processes are governed by quantum-laws. For the present we can only accept these as empirical facts.

**QUEBEC** (City), Canada (see 22.727), had a population of 95,193 in 1921, estimated at 110,500 in 1924. Nine-tenths of the population are French and Roman Catholic. Quebec had for some years before 1911 been displaced by Montreal in the shipping trade, but after 1911 the older port steadily improved its commercial and industrial position. As a manufacturing centre Quebec has profited by the cheap electric power supplied from the Shawinigan and Montmorency Falls. The harbour has been improved, and the largest drydock in the world has been built.

Important factors contributing to the increased commercial importance of Quebec were the successful completion of the Quebec bridge and the building of the Grand Trunk Pacific Railway (now merged in the Canadian National system), from Prince Rupert on the west coast of Canada to Quebec on the east. The distance from Quebec to Winnipeg by this railway is 145 m. shorter than that via Montreal to Winnipeg. The Quebec bridge, connecting the north and south shores of the St. Lawrence river at Cap Rouge, 9 m. from the centre of the city, was completed in 1917. This achievement marked the end of more than 10 years of effort, two accidents to portions of the huge structure having delayed the work in 1907 and in 1917. The completion of the bridge made possible the running of six railways simultaneously into Quebec from the south shore (see BRIDGES).

Quebec has always been a base of supplies for a large region of mines, lumber camps and farms, but has gained further importance owing to the rapid development of the water supplies of the province for purposes of electric power, particularly for the manufacture of wood pulp. A large Government technical school has been erected, and the basilica of Notre-Dame, the mother church of Quebec, which was burnt down in 1922, has been rebuilt. A large area of the Plains of Abraham has been made into Battlefields Park. The old portion of the Château Frontenac hotel was destroyed by fire in 1926. A war memorial cross has been erected in front of Montcalm Market, and a monument to Hébert, the first settler of Quebec, in City Hall Square.

**QUEBEC** (province), a province of the Dominion of Canada (see 22.724). Through the addition of Ungava in 1912, its area was increased to a total of 706,834 square miles. The population was 2,361,199 in 1921, an increase of 17% over 1911; about 96% are Canadian born. In 1921, 1,889,277 were of French and 357,108 of British origin; the number of Indians was 11,566. The chief cities and their populations in 1921 were: Quebec, the capital, 95,193; Montreal, 618,506; Verdun, 25,000; Hull, 24,117; Sherbrooke, 23,515 and Three Rivers 22,367. The population of Shawinigan Falls, an important centre of power development, increased from 4,265 in 1911 to 10,625 in 1921.

The Government consists of a lieutenant-governor, a legislative council of 24 members appointed for life and a legislative assembly of 86 members elected for five years. Quebec is the only Canadian province in which women are not enfranchised. The province is represented in the Federal Parliament by 24 senators and 65 members of the House of Commons. The legislative grants for higher education and elementary schools are apportioned according to population; of the grant for normal schools, however, the Protestants receive one-third. The elementary school grant is supplemented by local municipal taxation through trustees. After 1920 the provincial government, with the assistance of a Federal grant, did much towards the development of technical education.

**Production and Industry.**—The leading field crops and their values in 1925 were: hay and clover, \$58,517,000; oats, \$32,946,000; and potatoes, \$35,692,000; barley, wheat, rye, peas, buckwheat, beans, root crops, alfalfa and fodder corn are also grown. The area under crops in 1925 was 6,828,700 ac.; the total value of field crops was \$150,253,000. Apples, plums and other fruits are produced in large quantities. Between 1914 and 1925 the province spent a large amount annually on the development of the dairying industry, which showed marked expansion. The value of dairy products in 1925 was \$26,527,647.

In 1925 there were about 200,000 sq. m. of forest land in Quebec. Of this enormous area but a small proportion has been cut over; the estimated cut for 1925-6 was 1,500 million feet. Pulp and paper production are of growing importance: in 1924 pulp production was valued at \$44,090,213, and paper production at \$62,523,583. The maple sugar industry is of considerable importance, the average annual value of sugar and syrup produced approximating \$4,000,000. The forests, especially in the

northern part, abound in game, both fur-bearing and otherwise: 174,000 sq. m. have been set apart for the preservation of fish and game by the provincial government. Quebec ranked second to Ontario in the value of its fur trade in 1923, which amounted to \$3,049,656. The fisheries are important, the annual value of the catch being approximately \$2,220,000. The mineral production of the province in 1924 was \$18,429,872, a decline of nearly \$3,000,000 from the preceding year. The decline was chiefly apparent in the production of asbestos, mica, magnesite and cement, but copper, zinc, lead and molybdenite showed an increase in production.

**Manufactures and Communications.**—There were 7,142 manufacturing establishments in the province in 1923, with a capital of \$1,009,898,982, employing 163,622 persons, and with a gross production value of \$811,103,396. Rapid expansion of the use of water power for commercial purposes, especially at Shawinigan and Valleyfield, has contributed greatly to industrial progress. The chief manufactures are pulp and paper, textiles, boots and shoes, tobacco and cigars and machinery. Quebec had 5,254 m. of steam and electric railway in 1923. The headquarters of both the Canadian National Railway and the Canadian Pacific Railway are in Montreal. Of the 45,374 m. of highways in 1924, 2,516 were of gravel and some 2,000 of macadam or concrete. (See CANADA.) (S. LE.)

**QUEENSLAND** (see 22.732), a State of the Australian Commonwealth. Area 670,500 square miles. In 1925 the population was 855,214, an increase of 249,401 since 1911. Brisbane, the capital and principal port, had on Dec. 31 1924 a population of 245,015.

**Political History.**—Queensland is one of the strongholds of the Labour party, and Labour Governments were in power from 1915 to 1926. The Legislative Council was abolished in 1922. Several state enterprises were established, including sheep and cattle stations, butchers' shops, fish supply, a coal-mine and a State Insurance Department. Much of the legislation passed was of an experimental nature. The Primary Producers Organisation Act, passed in 1922, aimed at the organisation of the agricultural industries in a completely unified national organisation, and under the Primary Products Pools Act 1922 power was given for the creation of boards to control the marketing of any commodity. Capital punishment was abolished in 1922. The Lands Act Amendment Act, passed in 1920, which was regarded as repudiating the conditions under which leases had been granted for pastoral development, was strongly criticised in Great Britain. Queensland is the only Australian State which has developed its railway system from several maritime centres instead of from one capital city.

**Production and Industries.**—Essentially a pastoral country, in 1924 the State carried 19,028,252 sheep and 6,454,653 cattle. There has been a considerable development in dairying, the production of butter having nearly doubled between 1913 and 1925. Despite the "White Australia" policy, the sugar industry has made great progress in north Queensland. The labour employed is largely southern European, of which there was a considerable influx after the War. The output of sugar increased from 162,136 tons in 1910-20 to 519,017 tons in 1925. The action of the Commonwealth Govt. in guaranteeing the price of the yield for the three years 1920-2 induced mill-owners to make additions to plant and farmers to put new areas under cane. After 1920 there was a revival of cotton-growing. In 1919, 72 ac. were under cotton: in 1925 the acreage was 60,000, with a yield of 24,000,000 pounds. In order to encourage the industry, the Commonwealth and Queensland Governments advanced up to 5½d. per lb. on all seed cotton delivered at ginneries during the seasons 1923-4 and 1924-5. The production of ratoon or perennial cotton was at first prohibited, but later allowed under certain conditions. The value of the mineral production in 1924 was £2,305,963, of which £985,542 represented coal, £380,025 copper, £459,710 gold, £167,469 silver and lead, and £175,509 tin. (See AUSTRALIA.)

**RACES OF MANKIND.**—The study of the varieties of the human race has occupied the attention of thinkers from early times. Two entirely different forms of classification have been employed, one based on the study of the skull, the second, and more generally used method, on superficial characters, such as skin and hair, which may be observed on the living man. To a certain extent these two methods have been combined in modern times.

**Cranial Form.**—Apart from Sergi, who elaborated a method of classification based on *cranial form*, the shape being estimated by viewing the skull from on top, most anthropologists have preferred to take measurements, especial importance being attached to the cephalic index—the percentage ratio of the length to the breadth—but numerous other measurements have been made, mostly of little value for classification. W. L. H. Duckworth suggested the combination of three characters on the skull, the cranial capacity (which is obtained by filling the brain case with shot or rape seed and then pouring the seed into a graduated measure), the cephalic index and the degree of prognathism (measured by taking the angle which the most projecting part of the jaw makes with the forehead). On the basis of the possible combinations of these criteria Duckworth divided mankind into seven different groups.

**Coefficient Method.**—Karl Pearson devised a method, termed the coefficient of racial likeness, which aims by a method of averaging at including a very large number of measurements in a single figure. The method is complex, and depends on the difference between a series of measurements taken on a set of skulls belonging to one race, and those taken on a second set. There is less difference in those closely allied than in those more distantly related, and the coefficient is correspondingly smaller or bigger. The rather complex mathematical processes involved are the chief disadvantage of the coefficient, which is still in the experimental stage.

**Colour Groups.**—As regards the superficial characters observed on the living subject, certain criteria have found acceptance for a considerable time, but opinions differ as to the relative value of these criteria. The oldest grouping of mankind, which is still in popular use, is that of skin colour. It has been suggested that the degrees in pigmentation of the human skin are due to the effects of environment, either to sunlight or humidity or a combination of both, the evolutionary changes which took place at an earlier date having become part of the heritage of the races we know to-day. Although the darkest skins are to be found in the tropics, whereas the fairest occur in the temperate climate of western Europe, attempts to correlate skin colour and environment break down when specific cases are considered. Some exceptions can be explained by recent immigration, others again, especially in the individual, by racial admixture, for where races are mixed we may find members of the same family who are very differently pigmented. On the whole the average value of the skin colour in various groups is correlated with other criteria, which appear to be good bases for classification.

One of the most important of these is the cephalic index. Taking the length as 100, the proportion of the breadth seldom falls below 70 or over 90, and it is usual to describe those peoples with an index below 75 as *dolichocephalic* (long-headed), those above 80 as *brachycephalic* (short-headed), the intermediate group being *mesocephalic*. Taken by itself, either in the individual or the race, the cephalic index is by no means a certain guide. We find brachycephalic, mesocephalic and dolichocephalic groups in all the greater divisions of mankind. In the individual, a series of 6,000 Japanese contained one man with an index of 69, and one of 96, and in a continuous series between these two extremes over 700 (about 12%) having indices between 80 and 81, the average being just under the latter figure.

Of the characters generally in use, however, the cephalic index shows most consistently the lowest *relative* variation within

small groups. It is therefore of great value for classifying smaller units within the wider divisions, but deductions can only be drawn from the average of a reasonably large number of individuals, at least 50 of the same sex. The practice of artificial deformation may to a certain extent obscure the true head form, and where it occurs the cephalic index is often of little value.

Usually long heads are associated with long faces and vice versa, the face being then termed harmonic. A certain use of this fact has been made for classificatory purposes. There are other features of facial form which appear to be characteristic of different races, but though often easily recognisable are difficult to measure exactly.

**Stature and Nose Form.**—Stature is a very variable character, depending on many conditions, of which food and habit seem to be the most important. In spite, however, of this variation in individual cases the *average* stature of a group is a useful criterion. The form of the nose is estimated by an index formed by taking the length from the root to the junction with the upper lip as 100 and expressing the breadth across the nostrils as a proportion of this.

Professor Thomson, to whom the idea was originally due, and Buxton have shown that the nasal index tends to be high in those countries where the air is moist and hot and low where it is cold and dry, the various combinations of these two factors being associated with corresponding nasal indices. The correlation is high with certain very marked exceptions, of which the most important is the Australian aborigines. It seems probable that they migrated from a hot, moist climate, and that they have retained the form of nose most appropriate to such a climate. The evolution of any character needs the time factor, especially when, as in this case, evolution by elimination has played an important part. While the nasal index may be ultimately related to environment, it is still of considerable value for classification.

**Hair Form.**—On the basis of the form of the hair, mankind may be divided into straight-haired (*leiotrichous*), woolly-haired (*ulotrichous*) and an intermediate group of wavy or curly-haired (*cymatrichous*). Certain types are difficult to define, but usually the distinction is clear-cut. All types of hair may occur in the same population, where racial admixture has taken place, but normally the variation is slight in the same group.

In sections the woolly hair is flat and ribbon-like, straight hair is round, wavy and curly hair showing an elliptical form. Here also there may be a certain correlation with environment. The woolly hair occurs for the most part in the Tropics and may form a protection against the sun, being associated with special sweat-glands. The evolution of the hair form has taken place at a comparatively remote period, so that it remains the most convenient basis for the ultimate classification of the great groups of man, the other criteria being subordinated to it. In this classification physical criteria alone have been used; all cultural or linguistic terms have been avoided. Owing to historical reasons certain peoples have been named after the languages they speak, and subsequently these terms have been applied to physical types. Terms like Malay, Dravidian, Mongol and Bantu are used as if they could be applied to races and not merely to peoples speaking certain groups of languages.

**Other Classifications.**—The classification given below is based on the anatomical characters already discussed; attention has, however, been recently directed towards certain physiological characters as a basis of racial differentiation. Several criteria have been put forward, amongst them the different reactions of the blood sera in divergent races and the effect of the ductless glands on the macroscopical anatomical characters. Although great stress has been laid on the latter, especially by Sir Arthur Keith, neither this nor other physiological criteria have to the present time been sufficiently investigated to form a basis for a novel classificatory method.

 FIG. 11. Eskimo (female). FIG. 12. Indian (Hopi).

(For acknowledgment of photos, see text.)

*Straight-haired Groups.*—The straight-haired peoples correspond to a large extent to the races called by some writers Mongol or Mongoloid, or "the Yellow-Brown Race." All these peoples possess cheek-bones of a greater or lesser degree of prominence. In most cases the face is flattened, often markedly so. The skin is usually yellow, shading into a coppery yellow or brown on one side, and on the other, especially in women, a pale almost white yellow tinge. In Asia the cephalic index tends to vary between mesocephaly and brachycephaly, with some marked cases of the latter form. In America the Eskimo (fig. 11 on plate) are dolichocephalic and a wide range of mesocephaly and brachycephaly occurs among the other tribes.

While Haddon divides this race into three groups on the basis of a cephalic index, it is probably more convenient to adopt a primary geographical division and to separate the Leiotrichi into an Asiatic and American group, since the latter have been separated from their kinsmen in Asia for a long time and have to a certain extent specialised.

*Asiatic Groups.*—There are three groups in Asia, a northern or Arctic group, the Pareoans (the Dwellers beside the Dawn) and a southern or Proto-Malay, it being possible that the two latter groups, formerly included under the term Southern Mongoloid, should be classed together.

The northern group is rather indeterminate, and includes a number of tribes living in the circumpolar regions of Asia and extending even as far west as northern Scandinavia, where they are represented by the Lapps. Most of these peoples have mixed with other races, to which fact their diversity is due, but they certainly include a mesocephalic and a round-headed subdivision. In eastern Asia at least there is a more northerly group, living in the most easterly extension of the continent and a more southerly group, but the difference is probably due to racial admixture, consequent on the intrusion of the peoples who brought in the Turko-Mongol culture from the west and thus divided the northern and central groups of the straight-haired peoples.

In Korea there is a narrow belt which forms a connecting link between the northern and the Pareoan peoples. The latter differ most strikingly from their northern neighbours in having less prominent cheek-bones and a broadish nose. In the north of China they are often tall; in the south, where the type is found in greater purity, they are short and more stockily built (fig. 9 on plate). The Japanese represent a special variety of this type; they have mixed considerably with the Ainu, and this, at least in some cases, has altered their physical type.

The southern extension of these peoples, the Proto-Malays, are widely spread in southeastern Asia and in the islands. They are seldom found in an unmixed state, but have been brought so much in contact with the various other peoples of this region that it is often difficult to distinguish them except by their broader heads (see fig. 8).

The straight-haired peoples also extend into Central Asia, where they are known as Turks and Mongols. These terms are cultural and linguistic, and cannot be used in a racial sense. Great racial admixture has undoubtedly taken place in this region and much of the population is closely connected with the peoples of the west, but types frequently occur with straight hair, very prominent cheek-bones and folds over the corners of their eyes, all of which characters show affinities with the Arctic group already discussed.

Most remote from the straight-haired peoples and showing certain relationships to them are the Polynesians, who live on the islands of the Pacific from Samoa to Easter I. and Hawaii to New Zealand. They probably represent an old mixture between the Proto-Malays and a group of the curly-haired people called Nesiots (islanders, see below), but other admixture has taken place and their position is difficult exactly to determine.

*The Amerinds.*—As regards the American aborigines, for whom the term *Amerind* has become conventionalised, it has been disputed whether they should be considered to belong to one race or not. The Eskimo, who to-day inhabit the Arctic coast of America, with a western extension into Asia, and an eastern into

Greenland, once lived as far south as the coast of Massachusetts, and survived near Quebec till comparatively recent times. They differ from the other inhabitants of America in many respects notably in having extremely long skulls (the western Eskimo differ somewhat in this respect), which are compressed laterally and are very high-pitched. They have broad faces, an unusual feature in people with a long skull, and very narrow noses. The jaws are exceptionally well-developed and the individual teeth are very large, possibly owing to the nature of their food (fig. 11 on plate).

The Amerinds themselves vary considerably in most of those characters usually considered to be of racial significance. Hrdlicka, however, believes that they all belong to the same race. Verneau has recently affirmed the concurrence of types akin to the Melanesians, a view previously held by others also. Haddon suggests with every degree of probability that side by side with the straight-haired peoples there is a cymotrichous type, which he has called Palaeo-Amerinds.

The subdivisions of the true straight-haired Amerinds are somewhat complicated and need not be discussed in great detail. The best basis for division is the cephalic index, but stature and other features must be taken into consideration. The nasal index, it should be noted, increases towards the centre of the two continents (fig. 12 on plate).

The peoples of the northwest coast are most closely allied to the inhabitants of Asia, and are distinguished from the other Amerinds by their lighter skin colour. East of the Rockies and extending over the great plains and into the woodland area there is a group of tall tribes with mesocephalic heads, of whom the Sioux are a typical example. On the east coast in ancient times there was a different type with longer, narrower heads. On the American plateau and extending into central and southern America there is a round-headed type, of short stature and with straight noses, to whom the Maya of ancient times were akin. The Aztecs were more long-headed and their relationship with the more northerly peoples can be traced through some of the inhabitants of northern Mexico today.

The ethnology of South America is as yet not fully established, but several types can be distinguished, one akin to the Maya peoples and a different type, with a round head and tall stature, who live in Patagonia, of whom the Fuegians, familiar since Darwin's *Voyage of the Beagle* (1845) are a branch. Side by side with those straight-haired peoples there exist traces of a curly-haired race, the significance of whose presence in South America is discussed below. With the exception of the Palaeo-Amerinds the distribution of the straight-haired peoples is continuous, the Bering Strait forming the division between the Asiatic and American branches.

*Woolly-haired Groups.*—The woolly-haired people have an extremely discontinuous distribution, namely, an eastern habitat which stretches from the continent of Asia to Fiji, and a western, the greater part of Africa. Attempts have been made to bridge this gap. Hüsing believes that in ancient times short dark curly-haired peoples occurred on the Persian Gulf in localities where negroes are still found. These negroes are, however, the descendants of imported slaves, and there is no information of a definite character to support Hüsing's contention. Some of the jungle tribes of south India are said to have negroid characters, but at present no evidence has been collected to bridge the gap between the two groups, and the characters which link them may be due not to community of ancestry but to the effects of a tropical environment. In the absence, however, of any definite proof of this contention the two groups may be linked together, with the caveat that the links which should connect them have as yet not been discovered. While the original centre of dispersion of these peoples is at present uncertain, there are almost certainly secondary centres of dispersion in northeast Africa and eastern Asia.

In addition to woolly hair all these peoples have the following characters in common: dark skins sometimes almost black, broad noses, usually a rather small brain in relation to their size, especially among the taller members of the group, with forearms and shins proportionately long. In the skeleton there is a smooth-

ness of contour which even in adults often recalls the bony form of a child, and among some members of the group the forehead has that prominent and smooth form which is so characteristic of the infant of our own race. In both eastern and western groups there is a division which includes some very small or pygmy peoples and another of medium or tall-statured tribes.

*Eastern Group.*—The eastern group may be divided on this basis into the pygmy Negritos and the taller Papuans and Melanesians. The former are all dark-skinned and have heads which are slightly rounded, the cephalic index varying from just under 80 to about 83. There are slight local differences due to the extreme isolation to which these peoples have been subjected. Four separate geographical groups occur, one in the Andaman Islands (the Andamanese), one in the central regions of the Malay Peninsula and eastern Sumatra (the Semang), a third in various parts of the Philippine Is., usually called after a well-known tribe, the Aeta and a fourth group called after a tribe in the western mountains of Dutch New Guinea, the Tapiro, who have left traces in other parts of New Guinea and probably also in parts of Melanesia. All these groups are isolated from one another and occupy as it were almost the circumference of a circle. The Andamanese occupy a very special position, both racially and geographically; they have been isolated for a long period and until recently were not in contact with any other race. Such measurements as have been taken indicate that these people are remarkably true to type and show little variation from the average. They are probably the one human group which can be considered a "pure" race (figs. 2 and 3 on plate).

The Papuans and Melanesians are distinguished from the Negritos by their greater stature and narrower heads; the former probably represent the original stock. At one time they had a wide distribution throughout all Melanesia, probably to Australia, and the extinct Tasmanian aborigines seem to have been a variety of this stock. To-day Papuans are found in New Guinea and in some of the most easterly of the Indian Archipelago islands. They may be distinguished from their kinsfolk by their retreating forehead, prominent brow-ridges and the form of their noses, which are often prominent and rounded, with a down-turned tip (figs. 1 and 4 on plate).

The Melanesians are extremely variable and include a variety of racial elements, though the basis of the stock is Papuan. The racial mixing which has taken place will account for the fact that, although they are usually woolly-haired, all varieties of hair are found. Stature is equally variable, although the average height is under 5 ft. 3 inches. The prominent brow-ridges so characteristic of the Papuans is not common and the nose is usually smaller than in these peoples. The Melanesians have a wide distribution from the coastal regions of New Guinea and the neighbouring islands to the Pacific from New Caledonia to the Admiralty Is., and as far eastwards as Fiji; formerly they seem to have extended over most of the Pacific.

*The Bushmen.*—The Bushmen, who belong to the second group of the woolly-haired peoples, are also short, though not of pygmy stature; they differ from the other Ulotrichi in having yellowish skins. Now restricted to the Kalahari desert, they formerly ranged over the whole of south Africa and possibly over a much wider area. Their hair is short and curls into little tufts like pepper-corns, giving the appearance of bald patches. The head is small and low and there is little or no forward projection of the jaw. The most distinctive character of the Bushmen is a great development of the buttocks (*steatopygia*); this feature is specially developed in the women. The Hottentots are closely allied to the Bushmen and possess most of the characters already described. They represent a cross between the latter and other negroid stocks.

*True Negroes.*—The true negroes inhabit the Guinea Coast, but their original range seems to have been over most of tropical Africa. They are tall with black or dark brown skins, long narrow heads and retreating foreheads and prominent jaws. The lips are thickened and everted and the nose is very broad. They have mixed with other elements and have produced hybrid stocks (fig. 7 on plate). In the upper Nile valley numerous tribes,

called Nilotes, are to be found; they are characterised by a very tall stature, a slender build and extremely narrow heads. There is also a more round-headed strain, due probably to an early admixture with some curly-haired people. Most, if not all, of the Nilotes have been considerably altered by contact with other non-negro peoples. In central and southern Africa there are numerous negroid tribes characterised by a variety of physical form, due no doubt to racial admixture. The majority are long-headed with considerable variation in stature.

*The Pygmies.*—In the equatorial forests certain pygmy tribes live. These Negrillos differ from the tall negroes not only in their stature but also in the lighter colour of their skin, which is often yellowish and covered by a light down, and in the more rounded form of the head; the nose is broader even than that of the negro.

*Curly-haired Groups.*—The third great division of the human race, the curly-haired or Cymotrichous, occupies in many ways an intermediate position between the other two groups. Its distribution is world-wide, and it includes both undifferentiated and highly differentiated groups of mankind. The white races belong to this class. The centre of dispersion of the group was probably somewhere in Asia, but the precise limits of this cradle land have not yet been determined.

The hair varies from wavy to curly, and, whereas in other races it is, with but few exceptions, black or dark brown, in this group every shade occurs from a dead black to a fair straw colour; the brown, however, predominates. The skin colour is equally variable. Most members of this race have a fairly large brain in relation to their body size, but some of the more primitive members are extremely small-brained. The forehead in the males has usually a well-marked prominence over the eyes, the so-called "bar of Michael Angelo." The face is never flattened nor are the lips everted. The stature is very variable, but no pygmy types are found.

Every degree of cephalic index is found, and this still remains the most convenient method of simple classification. The race, however, contains certain sub-races which appear to be more primitive than others and the division into primitive and more advanced groups brings out certain points which may otherwise be overlooked. The primitive which survive are the Proto-Nordics, the Proto-Indics and the Australian aborigines. The Palaeo-Amerinds also probably belong to this class. The more advanced peoples include a dolichocephalic group, a mesocephalic and a brachycephalic group.

*Proto-Nordics.*—The Proto-Nordics appear at one time to have had a wide distribution over northern Asia. Some of the present inhabitants of the Turkoman steppes present this type in an undifferentiated form. The Ainu, who have within comparatively recent times been driven out of the main islands of Japan, and who still inhabit the northern island (Hokkaido) Saghalien, and to the south the Riukiu islands. This curious people are of medium stature, very stockily built, with large heads and a marked bar across the forehead. They have an abundance of hair on the head and body and long, wavy beards. Their eyes are straight as in Europeans and their general appearance contrasts very strongly with the Japanese who to-day live amongst them.

*Proto-Indics.*—The Proto-Indics may be classed geographically into three, possibly four, divisions: first, the jungle tribes of southern India (some of the more primitive tribes of northern India also have affinities with this stock); secondly, the Vedda, the most primitive of the inhabitants of Ceylon; and thirdly, some of the more primitive peoples of the southern part of the Malay Peninsula, of whom the best-known are the Sakai and Senoi. In Sumatra and Celebes and possibly elsewhere in the Malay Archipelago there survive tribes who may be considered as a fourth division of the Proto-Indics, but here they have for the most part been mixed with other stocks. In much of south-eastern Asia there is a racial background of Proto-Indics who have been overlaid by other invaders, but the stock has survived in a relatively pure state in the places enumerated above. The Proto-Indics have curly hair, very dark and often nearly dead black skins, a short stature and extremely broad noses.

*The Australian Aboriginal.*—The Australian aborigines almost certainly belong to the same stock, but they possess some special characteristics which may be due to the length of time they have been isolated from the parent stem. The skin is usually of a dark chocolate brown, the hair, which is somewhat variable but usually curly, is frequently very abundant on the face and body. The stature is medium, the nose very broad, and their most distinctive feature is the great bony development of the skull, including a great massing of bone over the eyes and a big development of the jaws and teeth (see figs. 3 and 6). Whereas the Proto-Indics, notably the Veddas, have extremely small skulls, those of the Australians, though often containing an extremely small brain-case, are always massively built, and the beetling brows, low forehead and projecting lower part of the face give the males a very characteristic appearance.

*Advanced Long-headed Types.*—The long-headed peoples of less primitive type can be divided into several groups, but it seems extremely probable that all belong to the same stock; most of them can be distinguished from the Proto-Indics by their greater stature, and all by the narrower form of the nose. Local groups of these peoples have become separated into sub-races which breed true.

*Eastern Groups.*—The most easterly representatives of these stocks in Asia are the *Nesioi*s, who are found mixed with the straight-haired, round-headed Proto-Malays in the Malay Archipelago, in the Philippines, sporadically in southeastern Asia and in the interior of southern China; the exact extension of these peoples is not yet fully known. In southern India a large proportion of the population belongs to a second group, *Chersioi*s (mainlanders, as opposed to *Nesioi*s, islanders). They are here much mixed with Proto-Indics and round-heads. In the northern part of India the proportion of the round-heads is much greater, and in the northwest the round-headed element predominates. In Rajputana and in the Punjab there is another group of long-heads, to be distinguished from the *Chersioi*s by their taller stature, fairer skins and narrower noses. These Haddon terms Indo-Afghans.

*Western Groups.*—Further west, in the horn of Africa and the desert between the Nile and the Red Sea, this stock is dominant in the population, though frequently mixed with negroes. These tribes represent the modern descendants of the Proto-Egyptian population. Among the groups of this stock with a white complexion several varieties may be distinguished: one, the *Eur-african*, seems only to occur in isolated spots in north Africa and western Europe, including part of the British Isles, another is met with among the Bedouin Arabs, while the third or Mediterranean race forms the fringing population of the Mediterranean sea and the western Atlantic seaboard of Europe. In the eastern Mediterranean it is inextricably mixed with the Armenoid peoples.

Among the Mesocephals Haddon includes three groups; two, however, the Pyrenean and the Atlanto-Mediterranean are probably hybrids. The third, the Nordic, is more clearly marked and is characterised by fair skin and hair, blue eyes and a tall stature (fig. 10 on plate). To-day they form one element in the population of the British Isles and northern France, Belgium and Holland, and northern Germany. They predominate in Scandinavia.

*The Round-headed Group.*—The great round-headed branch of the Cymotrichi is conveniently called Eurasiatic. It extends all along the great mountain chain from the central plateau of France on the west to the Himalayas on the east. The Alpine branch of the family is distributed along the central massif of Europe into central and even Eastern Asia, the Armenoid or Illyrio-Anatolian has a more limited range in southeastern Europe and western Asia. They may be distinguished by the extreme flatness and height of the head. In the Pamirs, in Persia, and extensively in central Asia and in India, a separate branch of this race, the Pamiri, is found, while locally in western Europe isolated examples of two early groups, the Prospectatores and the "Beaker Folk" still survive. They probably resulted from early crossing of round-heads with Mediterranean and Nordic man respectively. All these peoples are marked by the roundness

of their heads, their brown, auburn or black hair and somewhat sallow or olive skins. The eyes vary from brown to hazel, but blue eyes are found.

Most of the migratory movements which resulted in the present distribution of mankind took place too far back in history for us to estimate their exact course, but in all probability human stocks were evolved near the places where we first find them recorded in historic times. Some migrations belong to the domain of ancient history, but it is very doubtful how far these movements have actually affected the physical type. In all probability ethnological history has consisted chiefly of the gradual extension of dominant types (see A. C. Haddon, *Races of Mankind*, 1924). (L. H. D. B.)

**RACING:** see HORSE RACING.

**RACQUETS** (see 22,780), a game which, although standing as high as ever in the estimation of players, is so expensive that, except at the public schools, the tendency is toward less play than formerly. Indeed, more than one court has lately been converted into courts for the inexpensive game of squash racquets, which is becoming very popular. At the public schools, however, the number of racquets players is, if anything, increasing and the keenness is as great as ever.

The world's championship in 1910 was held by W. Jansetji, the Parsee player, but he was deprived of it soon afterwards by Charles Williams, then professional at Harrow School. He, in his turn, was beaten shortly before the War by Jock Soutar, an English born player attached to the Philadelphia Club. Soutar was the holder in 1925, having again defeated Williams at Philadelphia and New York. The open championship of England was won in Jan. 1925, by Charles Read, of Queen's Club. The leading amateur players in the period 1910-25 in England were E. M. Baerlein, who has established a record by winning the amateur championship nine times, B. S. Foster, H. W. Leatham, Hon. C. N. Bruce, J. C. F. Simpson and R. C. O. Williams. As a double pair Simpson and Williams, who visited America to play matches in the spring of 1925, were particularly good.

The British Army has, during the same time, had several good players, notably Gen. S. H. Sheppard, Col. W. E. Wilson-Johnston, Maj. A. C. G. Luther, Capt. T. O. Jameson and Col. A. J. H. Sloggett. C. C. Pell and Stanley Mortimer have been the leading American amateurs. Pell, on his visit to Great Britain in 1925, was successful, being the first American player to win the amateur championship.

The public schools competition, at Queen's Club, Kensington, is the central event of the English season. The winners of this since 1910 have been as follows: 1910, 1912 and 1914, Charterhouse; 1911, 1923 and 1924, Rugby; 1913 and 1921, Wellington; 1919, Marlborough; 1920, Malvern; 1922, Eton. The Charterhouse pair of 1910, H. W. Leatham and H. A. Denison, were one of the finest ever seen in the event, while D. S. Milford of Rugby in 1923 and 1924 was a brilliant individual player.

The Tennis and Racquets Association in 1923 undertook the remodelling of the rules of the game as played in the British Isles. In America and Canada there are some slight differences, the chief being that, whereas in the English rules two services are allowed, in the United States and Canada a player who delivers a fault is put out at once. With a view to cheapening the game, various efforts have been made to produce composition balls and racquets with metal frames, but at present nothing has been found adequately to replace the old conditions. (E. B. N.)

**RADEK, KARL** (1885- ), Russian politician, was born in Lvov (Austrian Poland) and educated at the universities of Cracow and Berne. In 1904 he became a member of the Social Democratic party of Poland and Lithuania. During the revolution of 1905 he spent a year in prison, and subsequently became a member of the editorial staff of social democratic newspapers in Poland, Leipzig and Bremen which supported the left wing of the German Social Democrats. During the World War, after some

months of illegal anti-militarist activity in Germany, he had to leave that country and established himself in Switzerland where he wrote for the Berne *Tageblatt*. He took part in the Zimmerwald and Kienthal international conferences in Sept. 1915 and April 1916. After the Russian revolution of March 1917 he crossed Germany, together with Lenin, Zinoviev, Martov and others and remained in Stockholm as the representative of the central committee of the Bolshevik party, issuing a weekly bulletin on the Russian revolution in French and German. After the second revolution, in Nov. 1917, he took part in the Brest-Litovsk peace negotiations. When the German revolution broke out in 1918 he made his way illegally to Germany, where as a representative of the central committee of the Russian Communist party he took a very active part in reorganising the German Communist party, working in its central committee after the murders of Karl Liebknecht and Rosa Luxemburg on Jan. 16 1919. He was imprisoned in Germany from Feb. to Dec. 1919. While still in prison in Berlin he was visited by Talaat Pasha and as a consequence relations between Russia and Turkey were re-established.

On his release from prison Radek returned to Russia, where he became one of the leading members of the praesidium of the Communist International. He returned illegally to Germany, however, and took part in the organisation of the joint congress of German Communists and Left Independents. As delegate of the Russian trades unions he attended the international conference of trades unions concerned with questions of the War. He was made a scapegoat for the failure of the German Communists to seize power in the autumn of 1923, and, on account of his support of the "Right" groups of the German Communists, he lost his authority in the Communist International, losing his place in its central committee and in the central committee of the Russian Communist party. He was a most prolific writer in the Russian Press on various questions of international politics. In 1925 he was appointed Rector of the Sun Yat Sen University for Chinese students in Moscow.

**RADIATION:** see ELECTRIC RADIATION.

**RADIO:** see BROADCASTING; WIRELESS.

**RADIOACTIVITY** (see 22.793d).—Among points of special interest that have arisen since 1910 may be mentioned the preparation of metallic radium by Mme. Curie and Debierne by electrolysis of a radium salt with a mercury cathode. Radium resembles metallic barium; melts at about  $700^{\circ}\text{C}$ , and is rapidly attacked when exposed to the air.

**Radium.**—The atomic weight of radium (*q.v.*) was found by Mme. Curie to be 226.45, using for the purpose about 0.4 gr. of pure radium chloride. A careful redetermination by Hönigschmid with about one gr. of radium gave a value 225.9, and is probably correct to 1 in 1,000. An international radium standard consisting of about 22 milligrammes of pure radium chloride has been prepared by Mme. Curie (*q.v.*), and is preserved in the Bureau International des Poids et Mesures at Sèvres, near Paris. Secondary radium standards have been issued to all governments who wished to purchase them. These have been calibrated by  $\gamma$ -ray methods both in Vienna and Paris, and are supposed to be correct within 1 in 200. The purchase and sale of radium have generally been conducted on certificates given in terms of this international standard.

The wide use of radium for therapeutic purposes, and its high cost—from £15 to £30 per milligramme element—have led to close search for uranium deposits. The amount of radium in an old mineral is always proportional to its content of uranium in the ratio of 3.3 parts of radium by weight to 10,000,000 parts of uranium. Consequently, an old mineral containing 1,000 kgm. of uranium should contain 330 milligrammes of pure radium. Initially several grammes of radium were separated from the uraninite deposits in Joachimsthal, Bohemia, and some of the material, which was the property of the Austrian Govt., was generously loaned to representative workers in radioactivity in England. A part of this radium is in the charge of the Radium Institute of Vienna, which is specially devoted to radioactive investigations.

The increasing demand for radium led to the working of low-

grade ores, containing on an average only about 2% of uranium oxide, of which there are extensive deposits in Colorado and other parts of the United States. Until 1922 the greater part of the world supply of radium was produced in America, but in that year very rich deposits of uranium ore, containing about 20 times as much radium as the American ore, were found in the Belgian Congo, and the American production practically ceased. Large quantities of radium were employed by the Allies during the World War for night compasses, gun-sights, etc. The radium is mixed with phosphorescent zinc sulphide to form a paint which becomes continuously luminous but, owing to the destruction of the zinc sulphide by the rays, this luminosity gradually decays.

**Radium Emanation.**—The atomic weight of the radium emanation is now known to be  $226.4 = 222$ , as was inferred earlier. This was confirmed by direct weighing with microbalance by Ramsay and Gray.

The radium emanation has proved of great service not only in radioactive researches but also in therapeutic work. The radium salt is dissolved in an acid solution and the emanation is pumped off with the large quantity of hydrogen and oxygen liberated by the action of the radiations on water. After sparking the mixture, the emanation can be purified by condensation with liquid air. A very intense source of  $\beta$  and  $\gamma$  radiation can be obtained by introducing the purified emanation into fine capillary tubes. Such emanation needles have been widely used for therapeutic purposes, while the use of very thin-walled tubes provides a powerful line source of  $\alpha$ -rays. The  $\beta$  and  $\gamma$  activity of such tubes rises to a maximum about four hours after introduction of the emanation, and then decays with the period of the emanation, viz., 3.85 days. The quantity of emanation liberated from one gramme of radium is called a *curie* and from one milligramme a *millicurie*. The quantity of radium emanation in a tube can be accurately determined by comparison of its  $\gamma$ -ray activity with that of a radium standard, since the penetrating  $\gamma$ -rays, both from the radium and the emanation in equilibrium, arise mainly from the same product radium C.

As regards other radioactive substances, large quantities of mesothorium have been obtained as a by-product in the separation of thorium from monazite sands. This substance, which is half transformed in about 6.7 years, emits only  $\beta$ -rays, but gives rise to radiothorium and subsequent products which emit  $\alpha$ -rays and penetrating  $\beta$ - and  $\gamma$ -rays. As a source of powerful  $\beta$  and  $\gamma$  radiation, this substance is very analogous to radium and can be obtained in about the same concentration. Since radium and mesothorium are isotopic elements, they are always separated together. Most commercial sources of thorium contain also uranium and radium, and consequently radium is always separated with the mesothorium and in relative amount depending upon the proportion of uranium to thorium in the mineral. Since mesothorium has a radioactive life short compared with radium, it commands a smaller price. The amount of mesothorium is standardised by comparison of its  $\gamma$ -ray effect with a radium standard.

Mme. Curie separated the polonium from several tons of pitchblende and obtained an exceedingly active preparation of a few milligrammes, but was unable to obtain it in a pure state, although several of its spectrum lines were detected. It was hoped by this experiment to decide whether polonium was transformed directly into lead, but this was found difficult to establish owing to the presence of impurities with the very small quantity of polonium.

The three types of radiation, known as the  $\alpha$ -,  $\beta$ -,  $\gamma$ -rays, emitted by radioactive substances are analogous in many respects to the types of radiation observed when a discharge passes through a vacuum tube, but are of much more penetrating character. It may be noted here that for the electrons in a vacuum tube to attain the velocity of the swift  $\beta$ -rays from radium, a potential difference of at least 2,000,000 volts would have to be applied. The very penetrating  $\gamma$ -rays are identical in all respects with X-rays of very short wave-length. Intense  $\gamma$ -rays are only observed in substances which emit swift  $\beta$  particles, and apparently owe their origin to the rearrangement of the nucleus after the emission of the  $\beta$  particle. To produce X-rays as penetrating as the  $\gamma$ -rays, about 2,000,000 volts would have to be put on the discharge tube.

The  $\alpha$ -rays, shown in 1903 by Rutherford to consist of a stream of positively charged atoms projected with high velocity, are now known to consist of charged atoms of helium which are projected with velocities of about 10,000 m. per second. While the majority of products break up with the expulsion either of an  $\alpha$  particle or a swift  $\beta$  particle, in a few cases no detectable radiation was observed. Such products were at first called "rayless" products, but the sequence of chemical properties, discussed later, shows that a  $\beta$  particle must be liberated but at too low a speed to detect with certainty. Actinium is now the only example of such a product.

A number of new products have been discovered, particularly in the uranium and actinium series. The results are included in the table of radioactive elements which will be found on the following page.

Table of Radioactive Elements

| Element                                | Atom-<br>ic<br>Wt. | Atom-<br>ic<br>No. | T                         | Rays                    | Range<br>cm. $\alpha$ -<br>Rays<br>(15° and<br>760 mm.) |
|----------------------------------------|--------------------|--------------------|---------------------------|-------------------------|---------------------------------------------------------|

In the table T is the time-period of a product or the time required for the product to be half-transformed. It will be seen that the value of T, which is a measure of the relative stability of atoms, varies between  $2.2 \times 10^{10}$  years (Thorium) and .002 second (Actinium A). The atomic weights and atomic numbers of uranium, radium, uranium-lead, thorium, thorium-lead have been directly determined. The atomic weights and atomic numbers of the others are deduced on the assumption that the expulsion of an  $\alpha$  particle (helium atom) of charge 2 and mass 4 lowers the atomic number of the succeeding element by two units and the atomic weight by four. The expulsion of a  $\beta$  particle raises the atomic number by one unit, but it is not supposed to influence the atomic weight to a detectable degree.

**Branch Products.**—In the great majority of cases each of the radioactive elements breaks up in a definite way, giving rise to one  $\alpha$  or  $\beta$  particle and to one atom of the new product. Undoubted evidence, however, has been obtained that in a few cases the atoms break up in two or more distinct ways, giving rise to two or more products characterised by different radioactive properties. A branching of the uranium series was early demanded in order to account for the origin of actinium. While the latter is always found in uranium minerals in constant proportion

with the uranium, Boltwood showed that the activity of the actinium with its whole series of  $\alpha$ -ray products in a uranium mineral was much less than that given by a single  $\alpha$ -ray product of the main radium series. The head of the uranium series is believed to be uranium Y, the branch product of the uranium series first observed by Antonoff. The branching is supposed to occur in the product uranium X<sub>2</sub>, 3% going into the actinium branch and the other 97% into the main uranium series. The atomic weights of actinium given in the table are calculated on this basis. The more recently discovered product *protoactinium* is the hitherto missing link between uranium Y and actinium.

The most striking cases of branching occur in the "C" products of radium, thorium and actinium, each of which breaks up in two or more distinct ways. In the case of radium C, a new substance called radium C'' was obtained by recoil from a nickel plate coated with radium C. This product emitted only  $\beta$ -rays and had a period of 1.4 minutes. Fajans estimated that the amount of the product was only  $\frac{1}{8,000}$  of that of radium C. To account for these results the following scheme of transformation has been proposed:—

where in the main branch a  $\beta$  particle is first expelled, giving rise to radium C', which emits an  $\alpha$  particle. The reverse process is assumed to take place in the other branch. Radium C', which emits a swift  $\alpha$  particle, has an exceedingly short period of transformation, which has been measured approximately by Jacobsen, and found to be about  $10^{-5}$  seconds. It is uncertain whether the radium C'' branch ends after the expulsion of a  $\beta$  particle. The resulting product is an isotope of lead like radium D in the main branch.

In the case of thorium C, two sets of  $\alpha$  particles are observed, one-third of the total number having a range of 4.8 cm. and the remainder 8.6 cm. Here, as in radium C, the main series goes by a  $\beta$ -ray change to the C' product. In actinium C, which also shows a dual transformation, Marsden found that 99.84% of the C atom change with the emission of an  $\alpha$  particle of 5.15 cm. range to the C'' product, the remaining 0.16% going to C', which gives  $\alpha$  particles of 6.4 cm. range. Rutherford and Wood found that the thorium C group emitted another set of  $\alpha$  particles of the great range of 11.3 cm., but of very small amount, about  $\frac{1}{10,000}$  of the total number. This result suggests that thorium C is even more complex than has been supposed. Evidence has been obtained of similar long range  $\alpha$  particles from radium C and actinium C. It is quite possible that a close examination of radioactive substances may reveal other examples of such complex methods of transformation, for, after the violent explosion that occurs during the breaking-up of an atom, more than one state of temporary equilibrium may be possible for the residual atom.

**Relation between Range of  $\alpha$ -Rays and Period of Transformation.**—We have seen that each  $\alpha$ -ray product emits  $\alpha$  particles of characteristic velocity which have a definite range in air. It was early observed that there appeared to be a connection between the period of transformation of a product and the velocity of the  $\alpha$  particles emitted. The shorter the period of transformation, the swifter is the velocity of expulsion of the  $\alpha$  particle. This relation was brought out clearly by the measurements of Geiger and Nuttall, where it was shown that if the logarithm of the range was plotted against the logarithm of  $\lambda$ , the constant of transformation, all the points lay nearly on a straight line.

A similar result has been observed for the thorium and actinium products. This relation, when carefully tested by Geiger appears to be only a rough approximation. It is still of great interest as indicating a possible relation between the stability

of the radioactive nucleus and the velocity of the expelled helium atom. This relation has proved very useful in forming estimates of the period of transformation of ionium and other substances before the results of more direct determinations were available. From this relation also the change which gives rise to the swift  $\alpha$  particle of radium C was believed to be exceedingly rapid. This has been confirmed by the detection of radium C' and measurement of its period. A similar conclusion is drawn for the product emitting the very swift  $\alpha$  particles from thorium C.

*Chemistry of the Radioelements* (see CHEMISTRY).—Apart from uranium and thorium, and a few special cases like radium and polonium, the radioactive products of short life exist in too small quantity to examine by the ordinary chemical methods; but by the use of the radioactive method of analysis, it was possible to form some idea of their chemical behaviour. Certain very interesting points soon came to light. Soddy found that the two elements, radium and mesothorium, although quite dissimilar in radioactive properties, were chemically so identical that it was impossible by chemical methods to separate one from the other. Other cases of this kind had long been suspected, viz., thorium and radiothorium, thorium and ionium and radium D and lead. He named such inseparable elements isotopes, since they appeared to occupy the same place in the periodic classification of the elements. (See ISOTOPES.)

Following the chemical study of the radioelements by Soddy, Fleck and von Hevesy, an important generalisation connecting the chemical properties of the radioelements was announced independently in 1913 by Russell, Fajans and Soddy. After the expulsion of an  $\alpha$  particle from a radioactive substance, the resulting product shifts two places in the direction of diminishing mass when the elements are arranged in families according to the Mendeleeff classification.

The expulsion of a  $\beta$  particle causes a shift of one place in the opposite direction. For example, by the loss of an  $\alpha$  particle from ionium of group IV., the resulting product, radium, belongs to group II., while the loss of another particle gives rise to the emanation which occupies the group O, and so on. By this method the chemical properties of all the known radioelements can be predicted from a knowledge of the radiations emitted from the products. This generalisation can be viewed from another important standpoint. From the work of Moseley, the properties of an element are defined by the atomic number which is believed to represent the resultant positive charge on the nucleus. The loss of an  $\alpha$  particle of mass 4, carrying two positive charges, lowers the atomic number by two units, while the emission of a  $\beta$  particle raises it by one unit. On looking through the table of the radioelements on preceding page it will be seen that many of them can be grouped under the same atomic number. These represent the radioactive isotopes of which some of the more important are given below, preceded by the atomic numbers:—

81. Thallium (204), thorium C" (208), actinium C" (206).
82. Lead (207), uranium-lead (206), thorium-lead (208), radium D (210), thorium B (212), radium B (214), actinium B (210).
83. Bismuth (208), radium E (210).
84. Polonium (210), thorium A (216), radium A (218), actinium A (214).
86. Radium emanation (222), thorium emanation (220), actinium emanation (218).
88. Radium (226), thorium X (224), mesothorium I (228), actinium X (222).
90. Thorium (232), radiothorium (228), ionium (230), uranium X<sub>1</sub> (234), uranium Y (230), radioactinium (226).

It will be seen that many of the radioactive elements are isotopic with known chemical elements. These radioactive isotopes differ not only in atomic weight but also in radioactive properties. The isotopes of lead are of special interest as they include the end-products of the uranium, thorium and actinium series—a question that will be discussed more fully later. It is of interest to note that polonium, actinium and protoactinium are new types of chemical elements which have no counterpart among the ordinary inactive elements.

*Transformation of Uranium.*—In 1900 the late Sir W. Crookes found that the  $\beta$ -ray activity of ordinary uranium could be re-

moved by a single chemical operation and concentrated in an active residue. This is due to the separation of the product uranium X, of period 24 days, which emits  $\beta$ - and  $\gamma$ -rays. A complete analysis of the transformations of uranium has been a matter of much difficulty. Boltwood showed that the  $\alpha$ -ray activity of uranium was about twice as great as that of a corresponding  $\alpha$ -ray product in the uranium-radium series, indicating that uranium contained two successive  $\alpha$ -ray products. This was confirmed by Geiger, who showed that the  $\alpha$ -rays from uranium consisted of two groups with ranges 2.5 and 2.9 cm. respectively. These two  $\alpha$ -ray substances, called uranium I. and uranium II. are isotopic, atomic weights 238 and 234 respectively. The latter, whose period is estimated at about 2,000,000 years, exists in relatively very small quantity compared with uranium I. Following the generalisation connecting the radiations and chemical properties of the series of radioelements, Fajans predicted the presence of a new product with properties analogous to tantalum, and promptly succeeded in isolating it experimentally. The new product uranium X<sub>2</sub> sometimes called brevium, has a period of 1.15 minutes and emits swift  $\beta$ -rays. The series of changes is thus:—

We have seen that Antonoff discovered another  $\beta$ -ray substance called uranium Y, separated with uranium X<sub>1</sub>, which has a period of 24.6 hours. This exists in too small quantity to be in the main line of succession, but is to be regarded as a branch product of uranium X<sub>1</sub>, and is believed to be the first element of the subsidiary actinium series.

Rutherford and Geiger found the number of  $\alpha$  particles emitted per gramme of uranium per second to be  $2.37 \times 10^4$ . From this the period of uranium is calculated to be about 6,000,000,000 years.

*Thorium.*—The first product observed in thorium was the emanation of period 54 sec., and this gives rise to the active deposit, which has been shown to consist of at least four successive products called thorium A, B, C, C". The emanation, after the emission of an  $\alpha$  particle, changes into a product of very short life emitting  $\alpha$ -rays. Its period was found by Geiger and Moseley to be about  $\frac{1}{10}$  second. The succeeding product, thorium B, emits only weak  $\beta$ - and  $\gamma$ -rays with a period of 10.6 hours, changing into thorium C of period one hour. We have seen that thorium C breaks up in a complex way, emitting three distinct groups of particles. Thorium C" is readily separated from C by the method of recoil. It emits penetrating  $\beta$ - and  $\gamma$ -rays with a half-period of three minutes. The active deposit as a whole decays ultimately with the period of thorium B, viz., 10.6 hours.

A special interest attaches to the product thorium X, first separated by Rutherford and Soddy, since experiments with it laid the foundation of the general theory of radioactive transformations.

A close analysis of thorium has led to the discovery by Hahn of a number of other important products. When the thorium X is separated from a thorium mineral or old thorium preparation, there appears with it another product called mesothorium I, of period 6.7 years, which is transformed with the emission of weak  $\beta$ -rays into mesothorium 2, of period six hours, which emits swift  $\beta$  particles and penetrating  $\gamma$ -rays. This changes into an  $\alpha$ -ray product, radiothorium, of period two years, which is transformed into thorium X.

Radiothorium is an isotope of thorium, while mesothorium I is an isotope of radium. The radiothorium can readily be separated from a solution of mesothorium and obtained in a concentrated form. Mesothorium when first separated would show a very weak activity, but in consequence of the growth of its subsequent product radiothorium, its activity would increase for several years. After reaching a maximum it would ultimately decay with the period of mesothorium, viz., 6.7 years.

*Actinium.*—Actinium of period about 20 years is believed to emit weak  $\beta$ -rays changing into radioactinium, an  $\alpha$ -ray product of period 19 days, first separated by Hahn. This changes into actinium X, an  $\alpha$ -ray product of period 11 days, discovered by Godlewski. Then follows the actinium emanation of period 3.9

sec., which gives rise to four further products named actinium A, B, C, C'. Actinium A has the shortest life of any product whose rate of transformation has been directly determined. Its period, as determined by Geiger and Moseley and Fajans, is .002 second. After emitting an  $\alpha$  particle, A changes into B, a product of period 36 minutes emitting weak  $\beta$ - and  $\gamma$ -rays, analogous to thorium B. Actinium C of period 2.16 minutes undergoes a complex transformation, giving rise to two distinct groups of  $\alpha$  particles. The main branch gives rise to actinium C' of period 4.8 minutes, which is readily isolated by the recoil method. Actinium C', which emits  $\beta$ - and  $\gamma$ -rays, is analogous in all respects to thorium C'.

In the above discussion on branch products it has been shown that the parent of actinium, called *protoactinium*, has been recently isolated by Hahn and Soddy. This substance emits  $\alpha$ -rays and has an estimated period of 10,000 years. We have seen that the actinium series is believed to have its origin in a dual transformation of uranium X. The first branch product, representing about 3% of the total, is believed to be uranium Y, a  $\beta$ -ray product of period one day. This is directly transformed into protoactinium.

While very active preparations of actinium have been made, it has not been found possible to separate it entirely from the rare earths with which it is mixed. Protoactinium exists in much larger amounts and should be ultimately obtained in a pure state.

*End-Products of the Transformations (re-stated).*—After the radioactive transformations have come to an end, each of the elements uranium, thorium and actinium should give rise to an end or final product, which may be a known element or an unknown element of very slow period of transformation. Since the expulsion of an  $\alpha$  particle lowers the mass of the atom by four units, and there are eight  $\alpha$ -ray products, the atomic weight of the end atom should be  $238 - 8 \times 4 = 206$ . The atomic weight of radium by this rule should be  $226 - 3 \times 4 = 218$ , a result in good accord with experiment. The atomic weight of the end-product of uranium is close to that of lead, viz., 207, and Boltwood early suggested that lead was the end-product of radium. Since in old minerals the transformations have been in progress for intervals measured by millions of years, the end-product should collect and be an invariable companion of the radioelement. Boltwood showed that lead is always present in old radioactive minerals, and in amount to be expected from their uranium content and geologic age.

This problem has been definitely attacked in the light of the chemical generalisation already given. It was clear from this that the end-products of uranium, thorium and actinium should all be isotopes of lead but with atomic weights 206, 208 and 207 respectively. In other words, uranium-lead if uncontaminated with ordinary lead should show a smaller atomic weight than ordinary lead (207), while thorium-lead should give a higher value. By the work of Richards, Soddy and Hönigschmid, these conclusions have been definitely confirmed. The lowest value for uranium-lead is 206, and the highest for thorium-lead 207.7.

Since any admixture with ordinary lead tends to give a value nearer 207, these results may be considered as a definite proof of the nature and atomic weight of the end-products. In minerals containing both uranium and thorium the atomic weight of the mixture of the isotopes will depend on the relative amounts of these two elements and their relative rates of transformation. In unaltered minerals the determination of the amount of lead coupled with its average atomic weight allows us to determine the amount of uranium-lead even if some ordinary lead be present. In this way it should be possible to make a reliable estimate of the age of selected minerals and thus indirectly the age of the geologic strata (see GEOLOGY). The amount of helium in the mineral gives a minimum estimate of its age, for, except in the most compact minerals, some of the helium must undoubtedly escape.

*Nature and Properties of the  $\alpha$ -Rays (re-stated).*—Although the  $\alpha$ -rays from active substances are of small penetrating power compared with the  $\beta$ - or  $\gamma$ -rays, they are responsible for most of the energy evolved by radioactive substances and contribute

most of the ionisation. Rutherford showed in 1903 that the  $\alpha$ -rays were deflected in a powerful magnetic and electric field and consisted of positively charged particles projected with high velocity. From the first it seemed probable that the  $\alpha$  particle was an atom of helium, and this was subsequently confirmed in a number of ways. The value of  $e/m$ —the ratio of the charge on the particle to its mass—and the velocity can be determined from observations on the deflection of the pencil of rays by a magnetic field and electric fields. In this way Rutherford and Robinson showed that the  $\alpha$  particle, whether from the radium emanation, radium A or C, gave a value of  $e/m = 4820$  e.m. units, while the electrochemical value of  $e/m = 4826$ , assuming that the mass of the helium atom is 4.00 and that it carries two unit positive charges. The magnitude of the charge carried by each particle was measured by Regener and Rutherford and Geiger, and found to be twice that carried by the electron. The velocity of the  $\alpha$  particles expelled from radium C (of range 7.06 cm.) was found to be  $1.92 \times 10^9$  cm. per sec., or about  $\frac{1}{15}$  the velocity of light. From this result the velocity of expulsion of all  $\alpha$  particles can be calculated from the relation found by Geiger, that  $V^2 = KR$  where  $V$  is the velocity of the particle and  $R$  its range in air. The evidence indicates that the  $\alpha$  particles from active products are in all cases atoms of helium. The  $\alpha$  particles from a given product are all emitted with constant velocity, which is characteristic for that product. We have already mentioned that the velocity of expulsion appears to be connected with the period of transformation of the element. The laws of absorption of the  $\alpha$  particle were first worked out by Bragg and Kleeman. On account of its great energy of motion, the  $\alpha$  particle travels in nearly a straight line through the gas, producing intense ionisation along its track. The effects produced by the  $\alpha$  particle, whether measured by ionisation, phosphorescence or photographic action, vanish suddenly after the  $\alpha$  particle has traversed a definite amount of matter. This definiteness of the end of the range of the  $\alpha$  particle of given velocity is remarkable. The range of the  $\alpha$  particle is usually expressed in terms of cms. of air traversed at 15° C. and 760 mm. pressure.

On account of its great energy of motion the effect due to a single  $\alpha$  particle can be detected in a variety of ways. Sir William Crookes first noted that the  $\alpha$ -rays produce scintillations when they fall on a screen of phosphorescent zinc sulphide. It is now known that each of these scintillations is due to the impact of a single  $\alpha$  particle. The number of scintillations can be counted with the aid of a suitable microscope, and this method has proved of great utility in many investigations. Scintillations due to  $\alpha$ -rays are observed in certain diamonds, but they are usually not so bright as in zinc sulphide. Kinoshita has shown that a single  $\alpha$  particle produces a detectable effect on a photographic plate. When the  $\alpha$ -rays fall on a plate nearly horizontally the track of the  $\alpha$  particle is clearly visible under a high-power microscope. By the expansion method developed by C. T. R. Wilson, the track of the  $\alpha$  particle through the gas is made visible by the condensation of the water on each of the ions produced. In a similar way the track of a  $\beta$  particle can be easily shown. The photographs of these trails bring out in a striking and concrete way not only the individual existence of  $\alpha$  and  $\beta$  particles, but the main effects produced in their passage through matter.

*Properties of  $\beta$ - and  $\gamma$ -Rays (re-stated).*—We have seen that the  $\beta$  particles, which are emitted by a number of radioactive products, consist of swift negative electrons spontaneously liberated during the transformation of active matter. The velocity of expulsion and the penetrating power of  $\beta$ -rays vary widely for different products. For example, the rays from radium B are much more easily absorbed by matter than the swift  $\beta$ -rays from radium C. Moseley showed that in the case of these two products each disintegrating atom gave rise usually to one  $\beta$  particle.

There is undoubtedly a close connection between  $\beta$ - and  $\gamma$ -rays, and swift  $\beta$ -rays are usually accompanied by penetrating  $\gamma$ -rays. For example, radium C, which emits very swift  $\beta$ -rays, some of which reach a velocity more than 0.98 of the velocity of light, gives rise to the most penetrating  $\gamma$ -rays observed in the uranium-radium series. There is one very notable exception, viz.,

radium E, which emits swift  $\beta$  particles but weak  $\gamma$ -rays. Gray has shown that  $\beta$ -rays in passing through matter give rise to  $\gamma$ -rays, and that these in some cases correspond to the characteristic X radiations observed by Barkla. The absorption of the  $\gamma$ -rays has been determined by the electrical method. Radium B has been found to emit several groups of  $\gamma$ -rays which differ widely in penetrating power. The greater part of the rays from radium C consist of penetrating  $\gamma$ -rays which are exponentially absorbed by matter. The ionisation in an electroscope falls off according to the equation  $I/I_0 = e^{-\mu d}$ , where  $d$  is the thickness of matter traversed and  $\mu$  the coefficient of absorption. When lead is used as an absorbing material the value of  $\mu = 0.5$  for the most penetrating  $\gamma$ -rays from radium C. The absorption coefficient for different kinds of matter is roughly proportional to the density, indicating that the absorption depends only on the mass of matter traversed.

The detailed study of the  $\beta$ -ray spectra discussed below has led to the conclusion that the  $\gamma$ -rays are characteristic radiations emitted from the radioactive nucleus in its rearrangement after the ejection of the  $\beta$  particle. These radiations from the nucleus in their passage through the atom excite the characteristic radiations of the external electronic system. Thus the total  $\gamma$  radiation of a radioactive atom consists not only of the  $\gamma$ -rays from the nucleus, which are generally far more penetrating than any type of radiation observed in an X-ray tube, but also of the characteristic X-rays of the atom.

Rutherford and Wooster have re-examined the spectrum of the  $\gamma$ -rays from radium B by reflection from rock-salt and calcite crystals. They found that the lines of the characteristic "L" spectrum corresponded to an atom of number 83, while the atomic number of radium B is 82. The  $\gamma$  radiation must therefore be emitted after the ejection of the  $\beta$  particle of disintegration and the change of charge of the nucleus. This conclusion has been confirmed by independent methods by Black, Ellis and Wooster, and Lise Meitner. The wave-length of the most penetrating  $\gamma$ -rays is much too short to resolve or detect by the crystal method. In order to excite such rays in an X-ray tube potential differences of the order of 2,000,000 volts will be necessary.

When the  $\beta$ -rays from a product like radium B or radium C are bent by a magnetic field and fall on a photographic plate, a kind of magnetic spectrum is obtained. Superimposed on the continuous spectrum due to particles of all velocities (between certain limits) certain sharp lines are observed, each of which represents a definite group of  $\beta$ -rays which are emitted at the same speed. The velocity corresponding to each line in the spectrum has been determined for a number of  $\beta$ -ray products by Hahn and Lise Meitner. The magnetic spectrum of radium B and radium C was examined in detail by Rutherford and Robinson, and more than 50 lines were observed, representing  $\beta$  particles projected over a wide range of velocity. The appearance of these lines in the spectrum appears to be connected with the emission of  $\gamma$ -rays and is believed to be due to the conversion of the energy of the  $\gamma$ -ray of definite frequency into the energy of an electron according to the quantum relation. When a thin layer of absorbing material is placed over the source, the primary  $\beta$ -rays diminish in velocity and the lines become broad and diffuse. At the same time, however, new groups of  $\beta$ -rays are formed by the conversion of  $\gamma$ -rays into  $\beta$ -rays in passing through the absorbing material, and these give well-marked bands on the photographic plate, occupying very nearly the same position as those due to the primary  $\beta$ -rays before absorption. The study of these primary and excited  $\beta$ -ray spectra by Ellis, Meitner and others has given important results on the conversion of  $\gamma$ -rays into  $\beta$ -rays, and has furnished accurate measurements of the wave-lengths of the  $\gamma$ -rays emitted by several products.

**Production of Helium (q.v.).**—Since the particle is an atom of helium, all radioactive matter which emits  $\alpha$  particles must produce helium. This has been found to be the case for every  $\alpha$ -ray product that has been examined. The rate of production of helium by radium in equilibrium has been measured with accuracy by Dewar, Boltwood and Rutherford. In terms of the international radium standard, the rate of production of helium by

one gramme of radium in equilibrium with its three  $\alpha$ -ray products has been found to be 164 cu. mm. per year. This value is in excellent accord with that calculated from the rate of emission of  $\alpha$  particles, viz., 163 cu. millimetres. The rate of production of helium by the radium emanation, ionium and polonium has been found by Boltwood to be in fair agreement with calculation. Soddy has observed the production of helium by purified uranium, while Strutt showed that the rate of production of helium in uranium and thorium minerals was in perfect accord with calculation.

Strutt has made a systematic examination of the amount of helium present in many minerals and rocks which contain minute quantities of radium, and has utilised the results to estimate the age of the geological deposits. On account of the tendency of the helium to escape from minerals in the course of geologic ages, this method gives only a minimum estimate of the age of the mineral, except in the case of very dense and compact specimens. The measurement of the lead content should ultimately prove a more reliable method of estimating the age.

**Heat Emission by Radioactive Matter.**—As was stated earlier, there is no doubt that the evolution of heat by radium and other radioactive matter is mainly a secondary phenomenon, resulting largely from the energy of the absorbed radiation. Since the particles have a large kinetic energy and are easily absorbed by matter, all of these particles are stopped by the radium itself or by the envelope surrounding it, and their energy of motion is transformed into heat. The evolution of heat from any type of radioactive matter is thus proportional to the energy of the expelled  $\alpha$  particles, together with the energy of the  $\beta$ - and  $\gamma$ -rays absorbed in the envelope. The energy supplied by the recoil of the radioactive atom after the expulsion of an  $\alpha$  particle is about 2% of the energy of the  $\alpha$  particle.

These conclusions have been confirmed by the measurements of Rutherford and Robinson, who found that each of the  $\alpha$ -ray products gave a heating effect proportional to the energy of the  $\alpha$  particle and absorbed  $\beta$ - and  $\gamma$ -rays. The emanation and its products when removed from radium were responsible for three-quarters of the heating effect of radium in equilibrium. The heating effect of the radium emanation, radium A and radium C, decayed at the same rate as their activity. From their measurements they found that the total heating effect of radium in equilibrium surrounded by sufficient material to absorb the  $\alpha$ -rays was 134.7 grammes-calories per hour per gramme. Of this, 123.6 grammes-calories were due to the  $\alpha$  particles, 4.7 to the  $\beta$ -rays and 6.4 to the  $\gamma$ -rays. The energy of the  $\beta$ - and  $\gamma$ -rays comes from radium B and radium C, but on account of their great penetrating power it is difficult to measure the  $\gamma$ -energy with accuracy. The results, however, show that the energy of the  $\gamma$ -rays is even greater than that of the  $\beta$ -rays, and the two together are equal to about 28% of the energy of the  $\alpha$  particles from radium C.

Measurements have been made of the heating effect of radium, uranium and thorium, and of uranium and thorium minerals. In each case the evolution of heat is of about the magnitude to be expected from the energy of the radiations.

**Radioactivity of Ordinary Matter.**—Apart from the wellknown radioactive elements of high atomic weight, only two other elements have been shown to exhibit radioactivity to a detectable degree, viz., potassium and rubidium. Campbell showed that these elements emit only  $\beta$ -rays and in amount small compared with uranium. This property appears to be atomic, but no evidence has been obtained of any subsequent changes. If the  $\beta$  particle comes from the nucleus of the atom, potassium should be transformed into an isotope of calcium, and rubidium into an isotope of strontium.

Radium and thorium have been found to be distributed, but in very minute amount, in the surface rocks and soil of the earth. The emanation from the soil diffuses into the atmosphere and causes a small ionisation which can be readily measured. A penetrating  $\gamma$  radiation, no doubt due to the presence of radium and thorium in the earth's crust, has been observed near the earth's surface, but becomes very small over a lake or the sea.

**RADIO RECEIVER** (see also BROADCASTING; WIRELESS TELEGRAPHY AND TELEPHONY).—The ideal radio broadcast receiver would be one so sensitive that any desired station could be picked up and its performance reproduced with perfect acoustic fidelity, in any desired sound volume, to the exclusion of all other signals and disturbances, with substantially no effort in operation or maintenance on the part of the owner. Such a perfect machine can only be approximated in some respects by existing receivers. From the standpoint of the listener five qualities of commercial broadcast receivers may be distinguished and used in rating particular types of sets as to merit, namely: (a) sensitivity; (b) selectivity; (c) quality of reproduction; (d) magnitude of undistorted power output; (e) convenience of operation and maintenance.

(a) *Sensitivity*.—A receiver must be several hundred times more sensitive, *i.e.*, capable of extra radio frequency amplification in that ratio, if it is fed from a small loop rather than an outdoor antenna. This follows from the fact that the loop picks up a relatively minute amount of energy from the passing wave. The loop is more convenient and adds somewhat to the selectivity of the set, as for maximum signal strength, it must point in the direction of the station to be received, and at right angles to this orientation the signal is a minimum.

It is not unusual for radio receivers to have a voltage amplification in the thousands, corresponding to an energy amplification of the order of tens or hundreds of millions. At present there is no standard rating of receivers according to sensitivity or amplifying power. Roughly, the amplifying power depends on the number of vacuum valves, not necessarily in the geometrical ratio which one might expect, however, for one set may utilise its stages of amplification more effectively than the other, with the final result depending on an intricate concatenation of design factors. The radio salesman's rating is even more indefinite, as he refers to a receiver as having a normal range of so many hundred or thousand miles, with reference to a transmitting station of given power. In practice, inordinate sensitivity is useless, inasmuch as nothing is to be gained by amplifying a signal below the "noise level" at the location of the receiver.

(b) *Selectivity*.—Like amplifying power, selectivity with respect to frequency may be numerically expressed. The waves of transmitting stations are measured in metres of wave-length, corresponding in a fixed relation to oscillating frequency in kilocycles per second. One station may transmit at a mean wave-length of 400 metres, corresponding to a frequency of 750 kc. per sec., while another is set at a wave-length of 450 metres (666 kilocycles). In order to respond to either of these transmitters the receiver is tuned to the appropriate frequency. The ability to hear the performance of one without picking up an appreciable signal from the other depends on the width of the band of frequencies, likewise expressed in kilocycles, which the receiver will admit at any given setting. Dr. Alfred N. Goldsmith has proposed the following scale for expression of receiver selectivity:—

- (1) Poor selectivity: equal signals become inaudible 80 kc. off tune.
- (2) Good selectivity: equal signals become inaudible 30 kc. off tune.
- (3) Very good selectivity: equal signals become inaudible 10 kc. off tune.
- (4) Excellent selectivity: equal signals become inaudible 5 kc. off tune.

Condition (4) oversteps the limit of desirable selectivity, if the factor of quality of reproduction is to be kept in sight. The wave radiated by the broadcasting station is not confined to a single frequency, but has itself a certain width, normally about 10 kc., which cannot be clipped by the receiver without losing some of the essential component vibrations of speech or music. The receiver must accordingly admit a band 10 kc. in breadth, corresponding to zero audibility 5 kc. off tune, if serious distortion is to be avoided, and where interference conditions permit a 20 kc. receiver admittance is to be preferred. In other words, close juxtaposition of frequency bands of broadcasting stations

tends to impair quality of reception by (1) forcing receiver designers in the direction of excessive sharpness of tuning; and (2) interference between stations in spite of (1).

(c) *Quality of Reproduction*.—The human ear responds, by no means with equal facility, to air waves between certain limits of frequency, ranging from a few oscillations per sec. to an upper limit as high as 20,000 vibrations per sec. in some individuals. Actually this is a greater range than required, and an organ responding to from 10 to 10,000 cycles will take in all the fundamental tones and essential overtones of speech and music. This is about the width of the acoustic spectrum which the best broadcasting stations and the best receiving sets try to reproduce. To a greater or lesser extent, however, they tend to lose the end frequencies—those of very low and very high pitch. When the low notes are dropped out, the result is "tinny"—high-pitched, shrill, mechanical, lacking in body. If the high notes are discriminated against, the output of the set is "drummy"—lacking sharpness, intelligibility, and characteristic timbre of voice and orchestral instruments. In the intermediate band which is transmitted there may be over- or under-emphasised frequencies, which stand out unnaturally or are lacking in the final result. All these lapses may occur in either the amplifying system or the electroacoustic converter (telephone receiver or loud speaker) of the receiving system, as well as in the corresponding portions of the transmitting equipment. A properly designed system is "flat," *i.e.*, indiscriminatory, over a sufficiently wide auditory band. At the present time, a receiver and reproducer covering a band of from 60 to 6,000 vibrations per sec. is considered satisfactory, and does indeed afford a reproduction close enough to the original to satisfy critical taste.

(d) *Magnitude of Undistorted Power Output*.—The output of a radio receiver, in terms of a fraction of a watt of sound energy, is a finite quantity and overloading reveals itself by distortion of the acoustic output, a distortion distinct from that caused by unequal amplification of different audio frequencies, as discussed under "Quality of Reproduction," but just as important if pure reproduction is required. Overload distortion causes a characteristic splitting or cracking of strong notes and emphasised syllables, sometimes to the point of unrecognisability. Harmonics or partial tones, not present in the original, are generated in the receiver. The accompaniment in music, and extraneous noises such as microphone hiss at the transmitter, atmospheric disturbances, etc., are brought up out of proportion, since the thermionic machinery of the receiver is "saturated" for the passages which were louder in the original performance.

The fact that must be kept in mind is that the vacuum valves used in receiving sets, particularly the last or output tube, have a definite and limited capacity for undistorted reproduction. A small valve, drawing moderate energy from the receiver power supply, can only deliver a few hundredths of a watt to the loud speaker—enough to fill an ordinary room comfortably. If greater volume is desired, larger tubes, with adequate power supply, must be employed. Some of the amplifier-loud speaker combinations have tubes as large, and consume as much power, as small broadcasting stations. By this means an undistorted reproduction as loud as the original is rendered available.

(e) *Convenience of Operation and Maintenance*.—In the matter of convenience of operation the present trend is toward reduction of the number of controls. Some early models of multi-tube receivers carried from six to 10 controls, but the problem of tuning them proved too much for the average unskilled listener. The average number of tuning controls at present is probably three, with some auxiliary handles which do not require frequent adjustment. For local station selection, however, "uni-control" accomplished by turning a single knob or drum, has been developed. For reception of distant stations finer adjustments, involving auxiliary or "vernier" controls, are generally required. A "volume control" for setting the loudness of the received signal at the desired level is necessary in addition to the tuning selectors. The best modern receivers show an increasing intricacy of internal equipment, with a surprising development of simplicity of control in inverse ratio.

The principal maintenance problem in the radio receiver is in connection with the power supply, and this disappears where power for the receiver is derived from the electric-light mains. The crystal, in the case of crystal receivers, and tubes, in tube receivers, require occasional renewal. For the rest, continuity of operation depends largely on the reliability of the manufacturer and the effectiveness of his testing and inspection arrangements. In the mechanism of the receiver proper there is nothing to wear out.

#### CRYSTAL SETS

*Types of Receivers.*—The simplest of broadcast receivers is the crystal type, which consists of a single tuned circuit including the antenna and ground, with the crystal, bridged across the tuning inductance or a portion thereof, delivering audio frequency energy to the telephones.

Except in a few instances where the listener is located a fraction of a mile from an extremely powerful broadcasting station, a crystal set is incapable of giving a loud speaker signal. In these isolated cases a long antenna in combination with a crystal of large surface and current-carrying capacity, such as carborundum, may be used to operate a loud speaker. Usually the crystal set feeds a pair of telephones at low or moderate volume. The possibility of distortion in such a simple device is necessarily far less than in valve receivers.

Various crystals are used in radio reception. The most common is galena (lead sulphide), with a fine wire, generally called a "cat-whisker," resting lightly on one surface. This combination is sensitive and fairly stable, but a jar is apt to interrupt reception, and the frequent readjustment necessary is one of the outstanding defects of the crystal receiver. Some pieces of the ore, however, abound in sensitive spots and require relatively little attention on the part of the listener.

"Fixed" crystals, adjusted at the factory, have been developed, and in some instances hold a fairly good adjustment for months. The process consists in sealing the wire and crystal together, and sometimes in the use of a multiplicity of contacts. The sensitivity is usually less than that of a good crystal used with an adjustable contact.

No matter how carefully the tuning circuits are designed, the resistance of a crystal, being low compared with the input impedance of a tube, prevents sharpness of tuning. Hence the crystal receiver is scarcely of use in congested radio neighbourhoods. It fills the need for a cheap, easily handled piece of equipment within 25 m. of a station, and where the operator is content to listen on head phones. In the British Islands the crystal still holds a prominent position, in that distances from stations are less and the demand for the more realistic reproduction of large tube receivers appears to be more moderate than in the United States, where the crystal outfit has fallen into a position of commercial unimportance.

#### TUBE RECEIVERS

(1) *Non-Regenerative.*—The non-regenerative single tube receiver is more selective but a rarity. It is only slightly more sensitive than a good crystal. In many instances a non-regenerative rectifying tube is used in multi-tube receivers.

(2) *Regenerative.*—The principle of regeneration in tube circuits is described under WIRELESS TELEGRAPHY and TELEPHONY (q.v.). In receiving circuits regeneration affords an inexpensive form of radio frequency amplification. A single tube, regenerating, serves both as a rectifier and very effective radio frequency amplifier. At a wave-length of 400 metres, which is a common value in the broadcast band of many countries, a single tube with maximum regeneration, short of full oscillation, gives about as much signal as two radio frequency tubes and a straight rectifier, coupled through broadly tuned transformers with regeneration substantially suppressed.

A common form of receiver is one in which the antenna tuning circuits are followed by the regenerative tube and one or two stages of audio amplification. This suffices for local (10-20 m. from a 0.5 kw. station) reception on loud speaker, and reception

of distant (up to 1,500 m.) stations on telephones, or faintly on the loud speaker, when two audio stages are employed, under average conditions. If regeneration is carried far enough the radio frequency amplification secured is very sizable, but there is a tendency to impair quality of tone by cutting off the sidebands. The result is a characteristic muffled sound. By somewhat detuning the circuit just before the detector, it is possible to lose grave tones, on the other hand, and to "equalise" the signal to a degree (i.e., to correct for loss of high frequencies). A similar effect may be present in some super-heterodyne receivers, as described below.

One of the salient disadvantages of the simple regenerative receiver lies in its propensity to oscillate and radiate waves which cause howls in nearby receivers. This may be obviated by means of a "blocking" or one-way tube ahead of the detector. Another drawback is that sensitivity is secured more or less at the expense of quality, and that for high sensitivity careful adjustment is necessary to ensure that it remains tuned to the desired frequency.

(3) *Radio Frequency Cascade-Amplification.*—The difficulty of controlling regeneration was at first one of the principal obstacles to the construction of receiving sets with several stages of radio frequency amplification. Regeneration occurs through the coupling or interaction of the grid and plate (input and output) circuits of a tube. Even if these circuits are not deliberately coupled, the natural internal coupling between the closely adjacent grid and plate of each tube, when several radio frequency stages are used, is enough to set the receiver into oscillation, with the usual resultant squeals, distortion, etc., and methods were developed whereby these internal capacitive couplings could be balanced out or "neutralised." In the usual form the receiver designed on this principle has two steps of radio frequency, a rectifier tube and two stages of audio frequency. However, by careful shielding (enclosure in metal boxes) of individual stages still further to reduce stray couplings, it is possible to employ three or even four radio frequency stages.

Balanced receivers—also called "neutrodynes"—are nearly always operated on open antennae, although in one or two cases they have been built for sufficient amplification for use on a loop. The number of handles is generally three, for the antenna and two stages of radio frequency. One type of neutralised receiver having six tubes, with three stages before the detector, requires only two knobs, one for the antenna and the other for the three radio frequency stages. Another type of balanced receiver has been built, using five dry-cell tubes, including two stages of radio frequency without regeneration, controlled regeneration in the detector and two stages of audio. Another type of radio frequency receiver controls oscillation by biasing the grids of the radio frequency tubes positively, thus introducing losses which tend to brake the regenerative action and to suppress oscillation. The usual number of tubes is five; an outdoor antenna is desirable, and, unless carefully handled, the receiver may fall into oscillation and radiate strongly.

(4) *Intermediate Frequency Amplification: The Super-Heterodyne.*—In the super-heterodyne receiver the incoming wave is mixed with that of a local oscillator, producing, after rectification, a lower frequency which is the difference of the two component frequencies, and which is more readily amplified than the oscillations received directly from the station. This "intermediate frequency" is subjected to one to three stages of amplification, rectified a second time, producing telephone currents, which are then amplified at tone frequency in the usual manner.

Besides the facility of tuned radio frequency amplification at the intermediate level, which is commonly 50,000 cycles per sec., the super-heterodyne method has a peculiar advantage in development of selectivity. When two waves of different frequency enter this type of receiver, the percentage difference in frequency, and hence the separability, are much greater after heterodyning than before. For example, let the local oscillator have a frequency of 500,000 cycles per second. Two waves are admitted to the set, of 530,000 and 550,000 cycles respectively. The percentage difference in frequency is less than 4%. After

FIG. 1. A portable 6-tube super-heterodyne; loop antenna, batteries, and loud speaker, all self-contained. Photograph shows the outfit open, ready for operation, with addition of a battery box permitting use of larger cells for other than portable service. Usual American wave-length range. Dry cell tubes. Dual control for tuning. FIG. 2. Cone type loud speaker. FIG. 3. 8-tube super-heterodyne of the desk type, completely self-contained with exception of loud speaker. (Legs and battery chamber omitted from this picture.) Single control for tuning local stations; dual control for distance reception. Loop antenna on top; batteries in cabinet. Dry cell tubes, with power valve output. Wave-length range 200-550 metres. FIG. 4. (Internal view of Fig. 8.) Shows shielding of radio stages and gang condensers for parallel tuning of circuits. Two tuning controls; usual American wave-length range. Indoor or outdoor antenna. FIG. 5. A 6-tube receiver (three stages radio frequency; detector; two stages of audio amplification) with single dial tuning. Usual American wave-length range. Storage battery tubes; loud speaker operation. Indoor or outdoor antenna—preferably latter. FIG. 6. Internal view of a 5-tube receiver combining neutralised radio frequency amplification, regeneration and audio frequency amplification after detection. This set is built by home constructors according to plans furnished by a radio periodical. May be used with indoor or outdoor antenna and will operate loud speaker. Storage battery operation. Usual American wave-length range. FIG. 7. Cone type loud speaker with power amplifier enclosure. Operates on 60-cycle alternating current. Storage battery operation. Usual American wave-length range. FIG. 8. A cabinet model receiving set, with built-in loud speaker and space for all batteries required and for storage battery charger. Six storage battery tubes, the last being a power tube for increased output. Circuit includes three stages of neutralised radio frequency, detector, and two stages of audio amplification. (For internal view, see Fig. 4.) FIG. 9. Combination electric talking-machine and super-heterodyne radio receiver, employing a cone type loud speaker which may be switched at will from the phonograph to the radio output. Completely self-contained and operates without batteries on alternating current, 120 volts, 60 cycles. Power tube output for both radio and phonograph reproduction. Loop antenna in one of doors, with usual directional effect. Turntable of talking-machine is electrically driven. American wave-length range.

(Figs. 1, 3, 7, Radio Corporation of America; Figs. 2, 4, 8 Stromberg-Carlson Telephone Mfg. Co.; Fig. 5, Atwater Kent Mfg. Co.; Fig. 6, Doubleday, Page & Co.; Fig. 9, Victor Talking Machine Co.)

FIG. 1. Two-valve regenerative receiver capable of operating a loud speaker within 15-20 m. of a normal broadcast transmitter. Wave-length range, 250-5,000 metres, depending on the coils plugged in. May be used with dry or storage battery tubes. One of the valves is a high-frequency amplifier and detector; the other a transformer coupled note frequency amplifier. Intended for use with outdoor antenna. FIG. 2. A crystal set, wave length range 250-2,000 metres, suitable for reception on head telephones within 20 m. of an ordinary broadcast station and 100 m. from a high-power transmitter. Intended for use with outdoor antenna. FIG. 3. Horn type loud speaker. FIG. 4. A seven-valve super-heterodyne receiver, operated on a frame antenna, without ground connection. Two frames are provided, one covering the 250-550 metre wave-length range, the other 1,000-2,000 metres. Storage battery operation, last two valves being of the power type. Designed for loud-speaker output. FIG. 5. Four-valve receiver with one stage of radio frequency, detector, and two stages of audio frequency amplification; wave-length range of 150-4,000 metres. Takes storage battery tubes with power valve in output. Plate battery contained in base. Intended for use with outdoor antenna and loud speaker; head telephones for distant stations. Photograph shows appearance open.

(Figs. 1, 2, 3 and 4, Burndept Wireless, Ltd. Fig. 5, Falk, Stadelmann & Co., Ltd.)

heterodyning and rectification, the two intermediate frequencies are 30,000 and 50,000 respectively, a percentage difference of 66%. It is then very simple to discriminate between the two waves by means of an intermediate frequency amplifier tuned to, say, 50,000 cycles. In that case the 530,000 cycles station will be the one suppressed. Inasmuch as the local beating frequency is variable, the other station may be suppressed with equal ease, and the 530,000 cycle wave admitted. The super-heterodyne is really a fixed frequency receiver, with means of converting the wave of any desired station to that frequency.

Super-heterodyne receivers average eight tubes, operate readily on a small loop, with one or two tuning controls and may be made completely portable and self-contained. They constitute the most expensive class of radio receiver, and afford the maximum selectivity and amplification of any type as yet developed.

**Tuning Mechanisms.**—In the United States, with a relatively narrow band of wave-length (200–550 metres) to be covered, the usual form of tuning is with a fixed inductance and variable condenser. In British practice, with a 200–1,700 metre band in England, if the high power Daventry station is to be included, and Continental telephone channels up to 4,000 metres, it is necessary to vary the inductance as well, in order to cover wave-length ranges of this order. Hence sets employing inductance taps, interchangeable lattice-work coils and the like devices, are more popular in British broadcast reception.

**Reflexing.**—It is possible to use one or more tubes in a radio receiver for both radio and audio frequency amplification. For example, given two valves, the first may be used as a radio frequency amplifier, the second as a rectifier and the audio currents sent to the first tube again, with the low frequency output of the same feeding the telephones. Tube number one is then said to be "reflexed." In this way thermionic valves may be employed economically, but the application of the method is limited if good selectivity, quality of reproduction and stability are desired. As a rule, if reflexing is resorted to, only one tube in a receiver is so employed, although sets have been constructed with three tubes reflexed, and the term has been used to denote a separate receiver classification.

**Combinations of Types.**—The characteristics of the forms of sets described above may be combined in various ways. For example, a super-heterodyne receiver may utilise a stage of neutralised radio frequency amplification before the heterodyne operation, or reflexing, regeneration and neutralisation may be combined.

**Power Supply.**—Vacuum tubes may be classified according to filament consumption, whether intended for storage or dry battery operation. The filament of a storage battery tube will consume about one watt, as compared with 0.2 w. for a dry battery valve. Three or four of the latter may be run on three-standard dry cells. The storage battery tubes, being larger, yield more amplification per stage. In general, for moderate volumes dry cell tubes will give equivalent service to storage battery tubes. When the filament power is derived from a chemical source, plate power is usually drawn from small dry battery blocks. For very loud reproduction, it is necessary to resort to power tubes with energy supply from the alternating current mains, through suitable transformers, rectifiers, and "smoothing out" filters for converting the bi-directional voltages into a direct or uni-directional flow. The same devices may be used for smaller outfits as well, in place of batteries.

**Choice of a Receiver.**—The choice of a receiver is determined largely by the capital to be invested, as well as the operating conditions to be met. For example, if the prospective buyer is unable to erect an outdoor antenna, because of a landlord's prohibition or other reason, and insists on receiving distant stations, it will probably be necessary for him to purchase a super-heterodyne receiver operating on a loop. But if the location is in the country, with an efficient outdoor antenna available, and no broadcasting stations sufficiently near to require first-rate selectivity in reception, a cheaper receiver may be considered. Again, a receiver required to give strong, undistorted reproduc-

tion, to fill the ballroom of a residence, for example, will necessarily be more costly than one which only serves a few persons in a small room.

As in other fields, if one is dealing with a reputable firm the returns depend roughly on the amount expended. A sane procedure is to invest first in a small set of one or two tubes, and to become familiar with radio conditions before buying a larger outfit.

**Home Construction.**—Instead of purchasing receivers, many listeners buy the parts and assemble them at home. With the increasing intricacy and decreasing cost, per unit of value, of radio equipment, it is scarcely worth while for amateurs to assemble their own receivers. The product of extensive research, professional design, systematised manufacture and inspection, and large scale production, is likely to be superior to the results of untrained individual initiative, and not very much more expensive, even if the expenditure of the home-builder's time is not charged. For those listeners who wish to construct their sets, out of a desire to give rein to their creative energy, the best advice is to build equipment recommended by some well-known radio periodical possessing a laboratory where ideas are thoroughly tried out before being allowed to get into print, and to follow closely the directions given. In all such enterprises changes are made at the changer's risk. In the nature of radio design, a single substitution or slight alteration in wiring will sometimes entirely spoil the performance of a set.

**RADIOTHERAPY AND RÖNTGENOLOGY** (see 28.887).—The discovery of X-rays by Röntgen in the autumn of 1895 marked an advance in the history of science, which, even yet, is not appreciated by the average individual. Röntgen himself realised immediately the value of his discovery to the science of medicine, and communicated it to the Physico-Medical Society of Wurzburg. Since then, if one excepts the years of the World War, hardly a month has passed without some innovation.

In 1910 the X-ray tube had varied but little from the original tube used by Röntgen and Crookes, the improvements in focusing and increasing the intensity of the rays being due to the labours of Campbell Swinton and chiefly to Prof. Jackson in 1896; indeed the modern focus tube (gas tube) has not materially changed since then. In this tube, the current is carried across the tube by a certain amount of gas, which is left behind in the process of evacuation. The current, impinging on a tungsten target, under a pressure of anything over 80,000 volts, results in the production of X-rays, which rays are now known to be electromagnetic impulses of very short wave-length. The only disadvantage of this tube is that individual control of the current and voltage is not absolute owing to fluctuations in the amount of residual gas. Despite this, however, it is largely used and for many purposes possesses advantages over the Coolidge tube.

**The Coolidge Tube.**—At a later period Dr. Coolidge of New York discovered that a glowing body emitted electrons, and at once designed a new type of bulb in which the current was carried across the vacuum by a stream of electrons from a hot tungsten wire. The hotter the wire the greater the current which

passed across the bulb. This, of course, solved the problem of separate control of the voltage and the current and thereby the problem of being able to reproduce exact working conditions at any interval. Unfortunately the hope, raised at first by the production of this tube, of obtaining an absolutely homogeneous beam of X-rays, was not realised.

*Production of Rays.*—The intensity of the X-rays depends upon the voltage employed to produce it and as the manufacture of high-potential generators (induction coils and step-up transformers) has improved out of all recognition since 1910, we can now produce rays of very great intensity, far greater indeed than are needed for radiographic purposes.

On the photographic side, improvements in technique have been very noticeable, the most noteworthy improvements being the use of intensifying screens to shorten exposures, double-coated films to increase the contrast of the negative and the Potter-Bucky diaphragm, the latter an ingenious contrivance for the purpose of cutting out secondary radiations and thereby sharpening the resulting picture.

*Use in War Therapy.*—During the years 1914-8 science was more or less subservient to the claims and the necessities of warfare, but even in this limited field X-rays were of enormous help. The localisation of bullets and shrapnel, which by any other means would have been impracticable, if not impossible, was carried out by numbers of experts, and to the untiring energies of these men a host of soldiers practically owe their lives.

*Use in Diagnosis.*—The past few years have been ones of very great activity in the X-ray world. Improvements in technique previously mentioned have brought the use of X-rays into much greater prominence in the study and the diagnosis of internal diseases (see DIAGNOSIS). Scigrams of the lungs, which were difficult to make and still more difficult to interpret, are now of the very greatest possible value in the study of diseases of the heart (*q.v.*) and lungs. It is no exaggeration to say that no diagnosis of disease of either of these organs is complete without an X-ray examination.

This advance is seen in the large hospitals for diseases of the chest, where formerly only a few hundred examinations were made, now the number amounts to thousands in the year. Whereas the air-filled lungs showed up clearly against the more dense, blood-filled heart and solid thoracic walls, the abdominal organs, that is to say the hollow viscera, being all of the same density, were all penetrated equally by X-rays and consequently were not readily differentiated on a plate. For a long time this difficulty appeared to be unsurmountable. Many substances were known to be opaque to X-rays but none of them could be taken with safety. Haudek, of Vienna, made careful experiments with bismuth sulphate mixed with jam and watched its progress through the oesophagus, but completely forgot to look for it in the stomach.

*Use of Bismuth.*—In 1901 Becker gave small doses of the same material and was the first to publish anything definite about the radiology of the alimentary tract. His results were confirmed in the same year by other workers, but the danger of poisoning (chiefly from metallic impurities in the bismuth) was so great that not sufficient could be given for diagnostic purposes, and nothing of any special value resulted. Somewhat later, the publication of a paper on the treatment of gastric catarrh by large doses of bismuth inspired Rieder, of Munich, to give large doses of bismuth in order to examine the stomach and intestines by means of X-rays.

Some few cases of poisoning were later reported, but with the help of the chemist an absolutely non-toxic preparation of bismuth carbonate came into use. The production of this non-toxic preparation of bismuth was difficult and it never attained to universal popularity. In 1910 experiments were made with barium sulphate—which was found to be almost as opaque as bismuth and not only much more readily freed from inorganic impurities but infinitely cheaper to use. With very few exceptions radiologists use some form of this salt in diagnoses.

*The Gastro-intestinal Tract.*—The production of a safe and suitable method of making the gastro-intestinal tract opaque

very greatly stimulated the investigations which were being carried on as to the condition of the alimentary tract in health and in disease. The study of both is still far from complete but, even with the results so far attained, diagnosis of intra-abdominal conditions has been greatly improved and numerous complaints previously described as "indigestion" and "gastritis," for example, are now readily classified.

*Cancer and Gastric Ulcers.*—Cancer of the stomach gave fairly typical X-ray evidence, but gastric ulcer proved almost as elusive to the radiologist as to the clinician. Certain investigators had observed a "niche" or recess on the wall of the stomach but its significance was not appreciated. In the same year (1910), Haudek and others, but chiefly the former, produced definite evidence that the "niche" was in reality an ulcer on the gastric wall filled with barium. Since then many other signs indicative of gastric ulcer have been noted and now the diagnosis of this condition is not a difficult matter. Ulceration of the duodenum, thanks to the labours of Carman and Miller in particular, and to Gregory Cole and Barclay, this region of the intestinal tract is becoming an open book to the radiologist.

Apart altogether from the value of X-rays in the investigation of disease, many new facts of physiological and anatomical (see ANATOMY) interest have been elucidated. Actual kinematograph films of the movements of the stomach and intestines during the process of digestion have lately been exhibited at a congress held in London, and on the Continent the writer has seen films of the heart and lungs showing their movements. By injecting the blood-vessels after death with a salt of lead in suspension, much valuable information to anatomists in the study of the vascular system has been secured by means of sciagrams.

*Therapeutic Values.*—From the earliest days of the discovery of X-rays, they were known to have certain curative properties, and scientists all over the world have been experimenting to place this form of treatment on a sound and scientific basis. Intractable skin diseases (*q.v.*) which resisted every other remedy often responded to X-rays, and it was noticed that some forms of malignant disease disappeared after treatment by irradiation. Means of accurately measuring the dosage of the rays were not known, but cancer had become so terrible a scourge that they were utilised indiscriminately for its relief, and at times with disastrous results. From 1905 onwards methods of measurement improved and in 1914 a dose could be administered with a certain amount of accuracy, the risk of burning became almost negligible, and we are now in possession of instruments capable of giving precise knowledge as to the amount of X-rays falling upon a given area. A spectroscope is used which takes a photograph of the X-ray spectrum. From it the wave-length can be ascertained and, the wave-length and the intensity of an X-ray beam being synonymous terms, it follows that the shorter the wave-length the more intense the X-ray.

Most of this work was carried on in Germany, where the idea prevailed that it was only necessary to get an intense enough ray and to measure it carefully in order to kill cancer. Apparatus for the production of these very intense rays was soon devised and before very long a great number of patients were undergoing treatment, so rapidly did this idea stimulate the popular imagination. In the early stages of this new form of X-ray therapy the results appeared to be most encouraging and the conquest of cancer was thought to be within reach. Subsequent statistics showed relief to be merely temporary. Great credit is, however, due to the early German workers and to our own specialists in Britain for the ingenuity and skill shown in standardising and rendering accurate the dosage of X-rays; but as a method of treatment of cancer we are getting no better results than were obtained in 1910. Russ and Colwell (in an illuminating book, *Radium, X-Rays and the Living Cell*) put the matter thus: "In radiology applied to biological problems there is a double difficulty, for the intensity of the radiation used, whether it be X-rays or Radium is a quantity which under many experimental conditions presents very considerable difficulties in its accuracy of measurement, and the animal itself provides a complex which refuses to be reduced to simple terms."

**RADIUM** (see 22.807d) is an element of atomic weight 226, the highest term in the alkaline earth series, calcium, strontium, barium. It is a metal having many analogies with barium and it is also a "radioactive substance", i.e., a substance that suffers a spontaneous disintegration accompanied by the emission of radiation (see RADIOACTIVITY). This radioactive property confers on radium a special importance for scientific purposes or for medical use, and is also the cause of the extreme rarity of the element. Though radium is only one of numerous radioactive substances, being neither the most radioactive nor the most abundant, its rate of decay and the nature of the products of its disintegration have proved particularly favourable in the applications of radioactivity, and make it the most important of radioelements.

#### CHEMICAL PROPERTIES

**Spectrum.**—If we do not consider the chemical actions of the radiations it emits, radium has exactly the properties that can be expected from its place in chemical classification. Radium is placed by its atomic weight 226, in the second column of the Mendelyev table. With an atomic number 88, it is the last term of the alkaline earth series. The salts of radium are colourless and nearly all soluble in water; the sulphate and carbonate are insoluble. Radium chloride is insoluble in concentrated hydrochloric acid and in alcohol. Radium and barium salts are isomorphous.

**Preparation of Radium.**—Metallic radium has been prepared in the same way as metallic barium, by electrolysis of a radium salt with a mercury cathode, mercury being eliminated by heating the amalgam in dry hydrogen. The metal is white and melts at about 700°. It attacks water and is rapidly altered by the contact of air. The atomic weight can be determined by the methods used for barium, e.g., by weighing the anhydrous radium chloride and the equivalent silver chloride or bromide.

**Optical Spectrum.**—The optical spectrum is composed, as with the other alkaline earth metals, of a relatively small number of lines of great intensity; the strongest line in the limit of the violet spectrum is  $3814.6\text{\AA}$ , and this line is a very sensitive test for the presence of radium; but spectral analysis is little used in the detection of radioelements, the radioactive properties offering a considerably higher degree of sensitivity. The high frequency spectrum is in accordance with the prediction for the element of atomic number 88.

#### RADIOACTIVE PROPERTIES

**Radioactive Elements in General.**—The theory of radioactive transformation has been established by Rutherford and Soddy (see RADIOACTIVITY). If  $n$  is the number of atoms of a radioelement, the proportion of the atoms destroyed in a certain time  $t$  is always the same, whatever  $n$  may be; the number of atoms decreases with the time  $t$  according to an exponential law,  $n = n_0 e^{-\lambda t}$  where  $\lambda$  is the radioactive constant of the substance.

The reciprocal of  $\lambda$  is called the "average life" of the element; the time  $T$  necessary for the transformation of the half of the atoms is called the "period" and related to the constant  $\lambda$  by the expression  $T = \log_2 \lambda$ .

Radioactive substances emit three kinds of rays known as  $\alpha$ -,  $\beta$ - and  $\gamma$ -rays. The  $\alpha$ -rays are helium nuclei carrying each a positive charge equal to double that of the elementary charge; they are expelled from the nuclei of the radioactive atoms with a great velocity (about  $1.5 \times 10^9$  to  $2.3 \times 10^9$  cm./sec.). The  $\beta$ -rays are electrons of various velocities which may approach the velocity of light. The  $\gamma$ -rays constitute an electromagnetic radiation of the same kind as light or X-rays, but their wave-length is generally much smaller and may be as short as  $0.01\text{\AA}$ . While the emission of some radioelements consists almost entirely of  $\alpha$ -rays whose penetrating power is very small, other radioelements emit  $\beta$ - and  $\gamma$ -rays which are able to penetrate a considerable thickness of matter.

**Uranium-Radium Family.**—Radium is a member of the uranium family, i.e., one of the elements resulting from the transformation of the uranium atom; its period is about 1,700 years. We give here the list of the radioactive elements of the uranium-radium family, the mode of their disintegration ( $\alpha$ - or  $\beta$ -rays), the atomic number and the period.

| Element and its disintegration     | Atomic Number | Period                  |
|------------------------------------|---------------|-------------------------|
| (Uranium) UI $\alpha \downarrow$   | 92            | $4.6 \times 10^9$ years |
| UX <sub>1</sub> $\beta \downarrow$ | 90            | 24.5 days               |
| UX <sub>2</sub> $\beta \downarrow$ | 91            | 1.14 min.               |
| UII $\alpha \downarrow$            | 92            | $1.2 \times 10^8$ years |
| (Ionium) Io $\beta \downarrow$     | 90            | $7.4 \times 10^4$ years |
| (Radium) Ra $\beta \downarrow$     | 88            | $1.7 \times 10^3$ years |
| (Radon) Rn $\alpha \downarrow$     | 86            | 3.82 days               |
| RaA $\alpha \downarrow$            | 84            | 3.0 min.                |
| RaB $\beta \downarrow$             | 82            | 26.8 min.               |
| RaC $\beta \downarrow$             | 83            | 19.5 min.               |
| RaC' $\alpha \downarrow$           | 84            | $10^{-8}$ sec.          |
| RaD $\beta \downarrow$             | 82            | 16 years                |
| RaE $\beta \downarrow$             | 83            | 4.85 days               |
| (Polonium) Po $\alpha \downarrow$  | 84            | 139.5 days              |
| (Lead) RaG $\alpha \downarrow$     | 82            |                         |

The atoms of each element are formed out of the destroyed atoms of the preceding element. None of these atoms can exist in nature otherwise than in uranium minerals, unless recently transferred from such minerals by a chemical or physical process. When separated from the uranium mineral they must disappear, their destruction not being compensated by their production. Only uranium and thorium are radioelements of so long a life that they have been able to last through geological times without any known production.

According to the laws of radioactive transformation, in very old minerals a state of equilibrium is attained where the ratio of the number of the atoms of the different substances is equal to the ratio of their average life. The ratio radium/uranium is about  $3.40 \times 10^{-7}$  in the older minerals; accordingly we cannot expect to find a mineral containing a high proportion of radium. Yet pure radium can be prepared in ponderable quantities while the other radioelements, except the slowly disintegrating uranium and thorium, are not capable of preparation in quantity, most of them because they exist in much smaller quantities. The quicker the disintegration of a radioactive substance, the smaller is its proportion among the earth's minerals, but the greater its activity. Thus radium is several millions of times more active than uranium and 5,000 times less than polonium.

**Radiation of a Radium Tube.**—Small quantities of radium are frequently kept in sealed glass tubes called "radium tubes." Radium emits only  $\alpha$  rays and a feeble  $\beta$ -radiation; the penetrating radiation emitted by a radium tube comes from the disintegration products gradually accumulated by the radioactive transformations of radium; first, radon or radium emanation, a radioactive gas, the next term to xenon in the series of inert gases; secondly, radium A, B, C, called "active deposit of rapid change"; thirdly, radium D, E and radium F or polonium, called "active deposit of slow change"; finally, inactive lead, and also helium generated in the form of  $\alpha$ -rays.

The strong penetrating radiation of a radium tube is emitted by radium B and C. When pure radium salt is sealed in a tube, the activity increases during about a month, till a state of equilibrium is attained between radium, radon and the active deposit

of rapid change, when the production of each of these elements is compensated by their destruction. The penetrating radiation consists in  $\beta$ -rays and in  $\gamma$ -rays, the latter particularly known by its valuable use in therapy.

The quantity of radon in equilibrium with one gramme of radium is called the "curie." If the radon is extracted and sealed separately in a tube, radium A, B, C, will accumulate and the penetrating radiation for one curie of radon will be the same as for one gramme of radium. But the activity of the radon tube decreases to half its value in 3.82 days, the period of radon, while the activity of a radium tube remains practically constant after equilibrium has been attained; the decrease is only 0.4% in 10 years.

**Effects of Radiation.**—Radiation of radium produces all the ordinary effects of rays (see RADIOACTIVITY); ionisation of the gases, continuous production of heat, excitation of the phosphorescence of certain substances (zinc sulphide, etc.), colouration of glass, chemical actions (decomposition of water for instance), photographic actions, biologic actions. Radium compounds observed in the dark exhibit a spontaneous luminosity, which is particularly bright in freshly prepared chloride or bromide, and is determined by the action on the salt of its own radiation.

**Activity of Radium.**—The  $\alpha$ -rays belonging to radium itself have a range of 3.4 cm. in air at 15° C. and normal pressure. The number of  $\alpha$  particles emitted by radium was measured by different methods of numeration (scintillations or counting chamber); the result varies from  $3.40 \times 10^{10}$  to  $3.72 \times 10^{10}$  particles per sec. and per gram of radium; from this data the average life of radium can be deduced. Three other groups of  $\alpha$  rays, of ranges 4.1 cm., 4.7 cm. and 7 cm. are emitted by radon and the active deposit, radium A, B, C. The heat produced by radium itself is about 25 calories per hour and per gramme. For a tube of radium in equilibrium with the disintegration products of rapid change, the production of heat is about 137 calories per hour and per gramme. This heating effect is principally due to the absorption of the energy of the  $\alpha$ -rays.

#### DISCOVERY OF RADIUM

In the year 1896 H. Becquerel discovered that uranium emits spontaneously a radiation that produces an impression on a photographic plate through a sheet of black paper, and ionises the air. Mme. P. Curie proved that this property, later called *radioactivity*, is characteristic of the atom of uranium and is possessed also by thorium. But she found that uranium minerals were much more active than could be predicted from their uranium content. By the hypothesis of the existence of a very radioactive unknown substance present in very small quantity, she undertook, with Pierre Curie, research for this substance in the uranium mineral called pitchblende.

The method they used in that work was entirely new; the result of the separations made by the ordinary process of chemical analysis was controlled by tests of the *activity* of every fraction; the activity was measured quantitatively by the current produced by the substance when placed in a special "ionisation chamber." Thus concentration of the radioactive property was traced in two fractions of the treatment, the fraction containing bismuth and the fraction containing barium.

In July 1898, P. Curie and Mme. Curie published the discovery of *polonium*, the element accompanying bismuth; in Dec. 1898, P. Curie, Mme. Curie and G. Bémont published the discovery of *radium*. Though the existence of these new substances was certain, they were present only in a very small proportion in the products obtained at that time; yet Demarçay was able to detect in the barium-radium mixture three new lines belonging to radium.

Only in 1902 did Mme. Curie succeed in preparing the first decigram of pure radium salt and made a determination of its atomic weight. The separation of barium was made by a process of fractional crystallisation. The work proved exceedingly difficult in practice on account of the great quantities of material that had to be treated. Later Mme. Curie made a new determination of its atomic weight and prepared metallic radium.

The new method used by P. Curie and Mme. Curie for the

discovery of polonium and radium—chemical analysis controlled by measurements of radioactivity—has become fundamental for the chemistry of radioelements; it has served since for the discovery of many other radioactive substances. The discovery of radium and the preparation of the pure element has had very great importance in laying the basis of the new science of radioactivity. The identification of its spectrum and the determination of its atomic weight have been decisive facts for convincing chemists of the reality of the new elements.

#### INDUSTRIAL PRODUCTION OF RADIUM

Radium has been manufactured in several countries. The first factory was started in France in 1904, not six years after the discovery of radium.

**Minerals.**—Radium is to be found in all uranium ores; however only those that have been mined in sufficient quantity for the extraction will be here mentioned.

**Pitchblende or Uraninite.**—Uranium oxide more or less impure. Mines in Bohemia and Belgian Congo.

**Autunite.**—Double phosphate of uranyle ( $\text{UO}_2$ ) and calcium. Mines in Portugal, United States and elsewhere.

**Carnotite.**—Vanadate of uranyle and potassium. Mines in Colorado, Australia and elsewhere.

**Betafite.**—Niobo-titanate of uranium and calcium, with rare earths. Mines in Madagascar.

The first radium was prepared from pitchblende from Bohemia. Later the principal exploitation was that of carnotite in Colorado and of autunite in Portugal. At the present time the most important supply is extracted in Belgium from the pitchblende of Belgian Congo. A mineral containing more than one decigram of radium per ton is considered as very rich. Minerals were treated down to a few milligrams per ton.

**Industrial Treatment.**—The method of industrial extraction of radium, in its essential points, is still the original method that was used and described by Mme. P. Curie. The operation can be divided in three parts: dissolution of the mineral, purification of a barium-radium salt, separation of radium from barium by fractional crystallisation.

The treatment for dissolving the mineral differs from one mineral to another. Autunite and certain carnotites are soluble in hydrochloric acid, but nearly all other minerals must be attacked by more energetic agents, for instance with the aid of sodium carbonate.

When the mineral does not contain much barium, a certain quantity of barium salt is added in order to carry away the radium. The barium-radium mixture is separated. With some variations in the mode of separation of uranium and lead (always present in the mineral) or eventually vanadium, niobium, etc., the operation consists in separating barium-radium by precipitation as sulphates and redissolving these sulphates by ebullition with sodium carbonate followed by a hydrochloric attack. Generally the radium-barium mixtures pass more than once through the state of sulphates.

After the purification of the barium-radium chloride, radium is concentrated by a process of fractional crystallisation, radium chloride, less soluble than barium chloride, being concentrated in the crystals. After this first enrichment the active salt is again purified particularly by the elimination of a residue of lead, and is transformed into bromide for the continuation of fractional crystallisation (the use of bromide was suggested by Giesel). The final crystallisations are made on small quantities of salt in very acid solutions. All the operations are controlled by the ionisation method, to avoid the loss of radium. At the end of the purification, great care must be taken to protect the chemist from the action of the radiations, especially at the moment of the filling of the tubes or apparatus with the radium salt. The radon liberated in the room during the fractionation must be eliminated by a constant aeration.

**Mesothorium.**—Some minerals of uranium contain also thorium. In these minerals radium is mixed with another radioelement, mesothorium I, isotope of radium. Mesothorium I is much more active than radium, but has less commercial value

for the same activity, because its life is much shorter (6·7 years). Mesothorium can be used instead of radium in certain cases.

### MEASUREMENTS

Measurement of the quantities of radium is very important for scientific as well as for commercial purposes. The quantities to be measured vary greatly. For instance, the tubes of radium prepared for medical use contain in general from 1 to 100 milligrammes, but radium has often to be dosed in natural waters or minerals, where the quantities are of the order of  $10^{-7}$  gr. and even down to  $10^{-12}$  gr. per litre of water or per gram of mineral.

For very small quantities, only an ionisation method of measurement can prove successful. For relatively great quantities, radium could be weighed but it would require a careful purification of the radium salt and the precision would in general be very unsatisfactory, considering the high price (about £10 the milligramme of this element). Here also, therefore, ionisation measurements are used for the sake of accuracy.

For quantities ranging from about one-tenth of a mg. to the greatest quantities available the radium must be sealed in a tube where radon and the active deposit accumulate. Measurements are made by comparing the ionisation produced in an ionisation chamber by the penetrating rays from the tube containing the unknown amount of radium and from a standard tube placed in the same conditions. A correction is made for differences of form or of absorbing power of the two containers.

The sale of radium is made according to the certificates delivered by national technical laboratories: National Physical Laboratory (London), Radium Institute (Paris), Radium Institute (Vienna), Physikalische-technische Reichsanstalt (Berlin), U.S. Bureau of Standards (Washington). Discrimination between radium and mesothorium I in sealed tubes is rather difficult. For this purpose, of commercial interest, scientific methods have been devised, based on the different penetrating power of the  $\gamma$ -rays, or on the different production of heat.

An international radium standard was prepared in 1911 by Mme. P. Curie. A quantity (about 22 milligrammes) of very pure radium chloride was exactly weighed and sealed into a thin tube of glass. This standard is kept at the International Bureau at Sèvres, and secondary standards, carefully compared with this one, have been prepared for different countries.

Determination of the very small quantities of radium contained in a few grams of a mineral, or a few litres of mineral water, is made by measuring the quantity of radon it produces in a definite amount of time. The mineral is dissolved and radon removed by passing a slow current of air through the solution, then after a few days, the radon accumulated in the solution contained in a close vessel is conveyed to a special ionisation chamber, where the current produced by the  $\alpha$ -rays of radon and radium A, B, C, is measured. This allows calculation of the amount of radium in the solution, if the ionisation chamber has been standardised by a similar operation made with a known quantity of radium. For the standardisation a very dilute solution is prepared by taking a small definite fraction of a solution containing a quantity of radium directly measurable by the penetrating rays. To facilitate the standardisation of apparatus, technical laboratories deliver standardised solutions or samples of radium-barium salt containing a known proportion of radium. The method of quantitative determination is exceedingly sensitive and can be used for amounts of radium from  $10^{-6}$  gr. to  $10^{-10}$  grammes.

### APPLICATIONS OF RADIUM

The principal application of radium is the use for therapeutic purposes of the biological action of the rays (see RADIOTHERAPY; THERAPEUTICS). The biological action is a selective destruction of certain cells and can have very dangerous consequences, but can also be directed against nocive tissue, as for instance in the case of cancer. For medical use radium is put into tubes of glass or in platinum needles, sometimes also on flat surfaces recovered by a varnish, for the irradiation of the skin. Another form of use is to keep radium in solution and to extract from

time to time the accumulated radon which, introduced into small tubes, has the same efficiency as radium till its activity has disappeared. The use of radium for pharmaceutical preparations has been frequently tried. The scientific basis, however, in this case is far from being well established. Experimentation on the improvement of the soil by small quantities of radium has been till now very limited and some favourable results in this direction have been claimed.

By incorporating radium with phosphorescent zinc sulphide it is possible to obtain luminous paints giving a weak light visible in darkness. The most important use of this paint is for watches. The quantity necessary is of the order of one-tenth of a milligramme per gramme of zinc sulphide. After several years, the phosphorescent product is altered by the action of the rays and becomes less luminous, though the quantity of radium has not changed appreciably.

*Radium in Nature.*—Radium exists in minute proportion in every kind of soil and water; the extraordinary sensitiveness of the methods of analysis has made it possible to ascertain this fact. If some inactive element is present in the same proportions, we are not able to detect it. The quantity of radium contained in the ordinary soil is of the order of  $10^{-12}$  or  $10^{-11}$  gr. of radium per gramme while a good radioactive ore contains about  $10^{-7}$  gr. of radium per gramme of mineral.

Radium existing in the depths of the earth is sometimes dissolved by water and affects springs. Other springs dissolve principally the radon liberated by the radium and their activity dies out with the radon. This would explain why certain mineral waters are reputed to be efficient for curative effect only when used directly at the source. Some radio-active waters contain amounts of radium up to  $10^{-10}$  gr. per litre: the amount of radon can attain  $10^{-7}$  curies per litre.

The radium in the soil is the origin of the small quantity of radon present in the air and is partly responsible for the natural ionisation of the air which is known to be an important factor in the meteorological conditions of the atmosphere. Radium and radioactive elements in general have played an important part in the evolution of terrestrial heat. It is not improbable that the radium present at the surface of the earth in a very dilute state has some connection with the evolution of life on our planet (see Mme. Curie, *Traité de Radioactivité*, 2 vol. (1910). (M. C.\*; I. C.)

**RAEMAEKERS, LOUIS** (1869— ), Dutch cartoonist, was born at Roermond, Holland, April 6 1869. He was educated in Amsterdam and Brussels, and began his career by painting landscapes, portraits and posters. In 1908 he produced his first political cartoons, and subsequently gained international fame by his violent anti-German cartoons in the Amsterdam *Telegraaf* and other papers during and after the World War.

**RAILWAYS** (see 22.819).—In this article the main developments since 1910 in the practice of railway engineering are described. Problems of track laying, both new construction and renovation and repair work, are discussed. New designs of locomotives are described and the substitution of steel for wood as a material for construction of coaches and wagons is recorded. The improved methods of signalling now adopted are dealt with, while the concluding section deals with the electrification of the railways, the whole being preceded by a short historical account of railway development during the years under review.

### I. HISTORY

The period 1910–26 was marked by a slowing up in the rate of additions to railway mileage. There were exceptions, as in Canada where railways were extended too rapidly, and in certain parts of Africa and Asia, but elsewhere, particularly in the United States, the additions were relatively small although large sums were invested annually since 1922, in enlarging and improving existing railway facilities and equipment. The greater use of motor-trucks and 'buses on the highways has tended to take away a part of the railways short-haul traffic, thus relieving the facilities for the longer hauls and postponing the need of new trackage. The annual growth in ton-miles has been smaller in

degree than in previous periods and the passenger traffic has tended to decline in volume. War conditions and the restriction of immigration have held down the rate of growth in population and agricultural development in North America.

The period under review was marked also by increases in the extent of governmental regulation of railways. The rate structures have become less flexible. Higher wages and other rising costs have borne heavily on the carriers. Rates have been increased, but not in degree corresponding with costs. Net income has suffered, the return on railway investments has declined, and railway securities have lower market values.

In Great Britain and the United States, the two countries which have been foremost in faith in private ownership rather than government ownership of railways, it was found expedient to turn the railway over to the Govt. for unified operation during the crisis; but in both cases private ownership and operation were resumed after the War. In Great Britain the policy of consolidation was made effective and the many small companies were reduced to four. In the United States a similar policy was written into law, but little progress has been made in carrying it into effect. In Canada the financial collapse of several weak carriers led to a substantial enlargement in the nationalised system.

In no country did the War bring about greater changes in respect of the railways than in Germany. Before the War they were mostly the property of the individual States of the Empire, but in 1920 they were handed over to the Reich. The results of their operation under these conditions were far from successful, and by the end of 1923 their working expenses were seven times greater than their receipts. In 1924 it was arranged that their operation should be put in the hands of a company, the Reichseisenbahn Gesellschaft, whose concession was to run normally for 40 years, expiring on Dec. 31 1964. The capital was fixed at £1,300,000,000, made up of (1) £650,000,000 ordinary shares to be issued fully paid to the Reich; (2) £100,000,000 preference shares to be issued to the public as required; and (3) £550,000,000 Reparation bonds bearing 5% interest, with a 1% sinking fund calculated to redeem them in 40 years. The transport tax imposed in 1917 on the gross receipts of the railways was continued, its proceeds up to a maximum of £12,500,000 being paid over for Reparation purposes, for which therefore, with the sum of £33,000,000 for the service of the Reparation bonds, a total of £45,500,000 annually was charged upon the railways. Fuller details about the railway systems of the various countries will be found under the several headings, e.g., GREAT BRITAIN: *Communications*; UNITED STATES: *Communications*. (X.)

## II. TRACK LAYING

This article deals with: (1) the laying of track on new lines; (2) the laying of new tracks parallel to existing ones; and (3) the relaying or renewal of tracks worn out in service. Track laying on new lines has been subject to little improvement owing to the marked decrease in new railway construction. Where mechanical equipment is employed, it consists usually of a pioneering machine placed at the head of a material train, the machine comprising a combination of derricks and conveyers by means of which the rails, sleepers and fastenings are passed forward and set in place. In America, during the years 1915-25, the locomotive crane was sometimes substituted for the track laying machine because of its ready availability and its adaptability to a wide variety of other uses. The laying of new tracks in close proximity to other lines already in service imposes no particular difficulties, as the materials can be readily distributed from trains on the operated track.

*Relaying Track.*—The relaying of track is a process constantly under way on the entire railway mileage of the world which must be carried on without obstructing traffic. The wooden sleepers or cross-ties used suffer deterioration from decay and mechanical agencies. Rails are subject to wear, particularly on curves. The tread or wearing surface becomes battered at the ends by the pounding of the wheels. The most common cause for renewal is the battering of the ends. A preventive measure is to replace worn fishplates or joint bars with new ones as a means of affording a more secure joint. Heat-treated high carbon fishplates and bolts have been used for this purpose. In the

United States and Canada marked economies have been effected by restoring or building up the rail surface with metal applied by means of the oxy-acetylene torch. Rails removed from track are often restored to a serviceable condition by sawing off from six to twelve inches of the ends. The adoption in America during 1925 of a standard rail length of 39 ft. instead of 33 ft. brings about a 15% reduction in the number of joints.

*Rebuilding Methods.*—In Europe it is customary to rebuild the entire track structure in one operation. The intervals between these "relayings" vary from two to eight years or more with the density of the traffic carried. In America and on a few railways in Europe the renewal of the rails, sleepers and ballast comprises three distinct operations, which are generally handled separately. The procedure under the European method ranges from a complete removal of the old track followed by its replacement with a new track, to the construction of a new track interlaced with the old, i.e., with the new sleepers placed between the old ones and the new rails offset a few inches to one side of the old rails. Under this plan the completion of a section of the new track is followed by the transfer of trains from the old to the new track, the removal of the old track and the shifting of the new track to correct alignment.

When the rail and sleeper renewals are carried on independently, the relaying of the rails is usually completed for one line of rails at a time. The new rails are set up on the ends of the sleepers and moved over into position as the old ones are unfastened. The number of rails changed on one operation and the amount of preliminary work done preparatory to the actual change depend on the time available between trains. It has been the almost universal practice to carry on rail laying without discontinuing the use of the track by trains, even on multiple-track lines. But some of the double-track lines in the United States have greatly expedited this work by confining the movement of trains temporarily to one track for the distance between the nearest stations provided with crossovers.

*Mechanical Equipment.*—Much of the work of laying rails is done by hand even in America, where heavy sections are employed. Some use is being made in England and America of hoisting equipment of various kinds, particularly for loading the old rails. In America considerable use is made also of portable hoists mounted on rollers or wheels for setting the rails into position and a few of the railways employ locomotive cranes. Renewal of the sleepers is also a manual operation except as it concerns the tamping or packing, which is now being done to a small though increasing extent with pneumatic and electric tampers in both Europe and North America. In the replenishing of the ballast the most laborious operation is the surfacing or raising of the track on the new material and it is this operation rather than in sleeper renewals that mechanical tamping has had its greatest application. More recent developments in the delivery and distribution of the ballast include the use of special cars with bottom doors designed to dump the material in any amount, and ploughs or spreader cars which distribute it uniformly over the track.

The conventional method of cleaning ballast is to scrape it out from between the sleepers and shake it up on the ballast forks to screen out the foreign matter. Sometimes it is thrown against stationary screens. Among the methods employed for accomplishing this end is a revolving power-operated screen and the use of a hoist and bucket to dump the ballast on a screen mounted on a car; a further scheme is the application of the principle of the vacuum cleaner in a large machine, which draws up the ballast through pipes into a chamber where the foreign matter is separated from the stone. (W. S. L.)

## III. LOCOMOTIVE DESIGN

Progress in the development of the locomotive steam engine during the period 1910-25 has been characterised by (a) increase in weight and power; (b) installation of superheated steam apparatus and feed-water heaters; (c) extended adoption of articulated types; (d) the application of the turbine engine with condenser; (e) the application of the internal combustion engine.

*Increase in Weight and Power.*—In Great Britain the 4-6-2 express engines on the L. & N. E. Rly. weigh 93½ tons and develop about 2,000 horsepower. Heavier engines of this type are in service on the Continent, while in the United States 150 tons has been reached. For freight service, the 2-8-0 type is in general use, the 2-8-2 type and the 2-10-0 have, especially in the United States, been largely adopted and the 2-12-0 has been tested.

FIG. 1. "Reid-MacLeod" Geared Turbine Condensing Locomotive. FIG. 2. 2-8-8-8-2 Triplex "Mallet" Articulated Locomotive.  
FIG. 3. Brown-Boveri Electric Locomotive, fitted with individual axle drive.

(Fig. 3. Courtesy of British Brown-Boveri, Ltd.)

Three-cylinder engines have been at work for some years on the L. & N. E. Rly. for both express and mineral traffic and are reported to be entirely satisfactory, and the system has also been adopted in the United States and in Germany. Three-cylinder engines, arranged for "simple" or "compound" (1 high pressure and 2 low pressure) working are standard practice on the L. M. & S. Rly. 4-4-0 type express engines. In France only, the four-cylinder compound engine has extensive application. The four-cylinder "simple" has had several applications in Great Britain notably on the L. M. & S. and G. W. Railways.

**Boiler Power.**—The great increase in boiler power, as is indicated by the provision of large grate areas, normally 18 to 30 sq. ft. but now reaching from 50 to 112 sq. ft., greatly exceeds in many cases the ability of the stoker to maintain the supply of fuel to the furnace. For such cases mechanical stokers have therefore been adopted. The use of oil fuel is still limited to countries with extensive oil producing areas, or to those in which the cost of coal is exceptionally high. Apparatus for burning pulverised fuel is now in considerable use in the United States and to a limited extent elsewhere.

**Boosters.**—In all locomotives, the adhesion required for "starting" purposes is greatly in excess of that required for running." If an additional temporary adhesion can be provided for "starting," much higher loads may be worked. In engines with hind carrying axles, the provision of a "booster" has this effect. A booster is an engine forming, on the locomotive, an auxiliary unit which can be attached to a carrying axle at will, to utilise the adhesive weight on that axle. Such boosters are in considerable use in the United States and are now being tentatively adopted on some engines on the L. & N. E. Rly., England.

**Superheaters.**—Superheating of the steam has been widely adopted on all main line engines. In the type of apparatus generally employed (introduced in Germany by W. Schmidt) the steam before reaching the cylinders is passed through a set of double-loop tube elements inserted in enlarged boiler tubes. The temperature aimed at is about 650° Fahrenheit. The economy of steam realised is from 15 to 25%. Many systems of feed-water heating apparatus have been installed on locomotives both on English and foreign railways, but as yet no system has commanded a general adoption.

**Articulated Types.**—In the "Fairlie" and "Kitson-Meyer" types of locomotives, the boiler, tanks and bunker are carried on a main frame below which two motor bogies are pivotted. Greater freedom could thus (owing to the short rigid wheel base of the bogies) be obtained for traversing curves, less weight per axle or per ft. run of the vehicle and double power with one engine crew.

The "Mallet" articulated locomotive now represents the heaviest and most powerful engines in the world (see plate, fig. 2). In this type, there are as in the "Fairlie," two sets of wheels, but the front set only are (in a bogie frame) pivotted or hinged on the main frame which carries the boiler, the hind set being mounted on the main frame in the usual manner. The engine is a four-cylinder compound, the two H.P. cylinders are on the main frame and drive the rear set of wheels and the two L.P. cylinders are on the bogie frame and drive the front set of wheels. The first U.S. Mallet was installed on the Baltimore and Ohio Rly. in 1905. It was of the 0-6-6-0 type, and weighed 150 tons. Mallet engines are now in service of 2-8-8-3-4 type, *i.e.*, three sets of eight coupled wheels 54 in. diameter, each set being driven by a pair of cylinders 34 in. diameter by 32 in. stroke (one pair being H.P. and two pairs L.P.) with a leading two-wheel truck and a trailing four-wheel bogie. The rear wheels (eight-wheel coupled and four-wheel bogie) also form the tender carrying wheels. The total weight in working order is 376 tons.

The "Garratt" type of articulated locomotive has, similar to the Fairlie, two free bogies (with the pivots located towards either end) but carries its tanks directly on the bogies. The "Modified Fairlie," as its name implies, embodies all the essential features of the Fairlie with girder frame and central pivotted bogies. Both of these latter types can embody a very large boiler consequent on a large extension of their wheel base, and in their carrying their tanks fore and aft of the boiler.

**Turbine Locomotives.**—A locomotive ("Reid-Ramsay" of 1904) with a turbine engine driving through electric transmission to motors on the driving axles and fitted with condenser was constructed and was put through a series of tests. Thereafter a more powerful locomotive (Ramsay Condenser) was constructed; this locomotive was tested on the L. & Y. Railway. Neither of these experiments indicated that the locomotive had attained the necessary combination of the requisite economy in construction, running charges and maintenance, with the requisite efficiency in operation.

The latest system, now (1926) in process of testing, is the application of the geared turbine driving direct on to the motor axles. Four types of locomotives have been built. In Switzerland by the Zoelly method ("Zoelly"), on an existing 4-6-0 type locomotive the turbine is placed transversely on the framing. The gear ratio is 30/1. The condenser is of the "surface" type with a condensate cooler of the air-cooled evaporative type. In Sweden on a locomotive of the two-vehicle type, one vehicle carries the boiler and the other, which has three-motor axles and one-truck axle, is equipped with the main driving machinery and also carries the condensing plant. The turbine (transversely placed) develops 1,800 H.P. at 9,200 R.P.M. and has a gear ratio of 22/1. The condenser is surface type air-cooled. In Great Britain (North British Locomotive Co. Ltd.) the locomotive, on the "Reid-MacLeod" system is of the double-bogie type (see plate fig. 1). Two geared turbines are employed; the high pressure driving two-motor axles on one bogie and the low pressure on the other. The turbines are arranged longitudinally on the frame. Coupling rods between the motor wheels are not required. In Germany (Krupp) the application is in principle similar to "Zoelly's" but a new locomotive has been constructed of the two-vehicle type; one vehicle 4-6-2 type (as in ordinary locomotive practice) is equipped with the main driving mechanism and also carries the boiler; the other vehicle carries the condensate cooler in addition to the necessary supplies of coal and water.

**Internal Combustion Locomotives.**—Little progress has been made to the present time in respect of the application of the internal combustion locomotive to the work of railways. Installations up to 450 H.P. (Diesel-Electric) for a saloon car with trailers have been adopted for light railway work. The locomotive in the German-Swiss experiment ("Klose-Sulzer") of 1913 was of the 4-4-4 type equipped with two Diesel engines direct-coupled to the motor axles. Starting the locomotive and running up to 6 M.P.H. were effected by the admission of compressed air to the combustion cylinders. Speeds of 12 to 20 M.P.H. were reported to have been effected, but difficulties involved by the low temperature of the air exhaust seem to have proved insuperable. At the Stettin Exhibition of 1924 was shown the two-vehicle locomotive designed by Professor Lomonosoff. The main vehicle 2-10-2 type is equipped with a six-cylinder set of Diesel engines with generator and with electrical transmission to motors on the driving axle, and developing about 1,200 brake horsepower. The weight is about 120 tons. The other vehicle or tender carries the circulating water cooler. There was shown also at this Exhibition an 0-8-0 type "Linke-Hoffman-Lauchhammer" locomotive equipped with a six-cylinder Diesel engine of 400 H.P. driving through a Lentz hydraulic-transmission-gear on to a lay shaft and thence to the eight-coupled wheels.

**Locomotive Types, Names and Symbols.**—The following table gives the popular names which have been adopted for locomotives in general use and also their type symbols. The mid figure or letter signifies the number of wheels or axles which are coupled. In the British and American systems it signifies number of wheels; in the French, number of axles; and in the German, the letter signifies number of axles, *i.e.*, A=1, B=2, etc. The first and third letters signify similarly the number of front and hind carrying wheels or axles. In articulated engines the mid figures or letters signify the number of coupled wheels or axles, and the end ones the carrying wheels or axles. In articulated engines with carrying wheels between the coupled sets, each set is read as for non-articulated engines, thus: 2-6-2—2-6-2.

#### IV. CARRIAGE, WAGON AND BRAKES

Broadly speaking, both in the case of carriages and wagons, the aim of designers is to secure the greatest possible capacity in relation to tare weight, due regard being, of course, paid to strength of construction. Railway companies in general attach great importance to the question of weight, due to considerations of economy both as regards hauling power and maintenance of permanent way.

**Materials.**—The scarcity of suitable timber for manufacturing coaches has become so serious a problem, that efforts had to be made to find a suitable substitute. Steel had already been used with success for wagon construction, but doubts were expressed as to whether passenger vehicles made of steel would be satisfactory. In the first place it was argued that steel coaches would be too heavy and secondly that they would prove entirely unsuitable for tropical countries owing to the heat conducting properties of the material. The latter was held to be a very serious objection for the shortage of timber was being most strongly felt in India, where teak was becoming more and more expensive.

A strong belief existed in certain quarters, however, that a substitute for timber had undoubtedly to be found. Considerations connected with the safety of passengers also exerted a strong influence, for it was felt that with steel vehicles the risk of fire would be reduced to a minimum and that in the event of a collision there would be much less danger of coaches telescoping. These contentions were borne out quite dearly by subsequent experience.

**Steel Coaches.**—The question of steel coach design, therefore, received very close attention from designers. A perfectly satisfactory vehicle was not, however, produced at once. Early designs were heavy and expensive to manufacture and the modern steel coach, which matches the wooden coach in weight, in price and in comfort, is the result of a process of careful development. According to the best modern practice, steel coaches are built in

sections, that is to say, the body sides, ends and roofs are constructed on separate jigs, these parts on completion being assembled with the underframe. This method ensures that parts shall be interchangeable—a specially important point when coaches are being shipped abroad—and is economical as regards cost and distribution of labour.

The steel coach may be so designed that the body provides the necessary strength in itself, trussing on the underframe not being required. The elimination of truss rods, besides reducing the weight of the coach, affords perfect accessibility to the brake-work and the electrical gear.

In order to prevent discomfort to passengers from extremes of heat and cold, an inner lining of insulating material is so arranged that air can circulate freely up the sides and along the roof. This device very effectively solves the temperature question and steel coaches are now firmly established in such countries as India and Egypt. Corrosion is one of the chief problems where any steel structure is concerned and measures have to be taken to prevent this. At the design stage, therefore, ledges or receptacles where moisture might accumulate are eliminated as far as possible. When the constructional stage is reached, all parts, before assembly, receive an application of anti-corrosive paint, and a method of cold riveting may be employed in order to avoid damage to this protective covering. In some instances lead-coated sheets are used as an alternative. Either wood or steel interior trim may be employed, but the former is generally preferred by British designers.

**Brakes.**—The principal innovation in regard to brake gear is the introduction of the automatic slack adjuster, to reduce the amount of slack due to wear and thus make the retarding action as uniform as possible.

**Articulated Carriages.**—Carriages built on the articulated principle are also an interesting development. According to this system two bodies may be carried on three bogies instead of four, or the system may be extended to any number of bodies. The object is to obtain smoother running with less weight and less cost. The adoption of pneumatic operating gear for doors has proved particularly useful on underground systems where it is imperative that stops at stations should be as short as possible.

**Other Developments.**—The modern demand for increased comfort for passengers has led to improvements in seating arrangements, increased dining accommodation, extension of heating systems, etc., and one of the designer's chief problems is how to meet this demand without undue increase in the weight per passenger carried.

**Wagon Designs.**—The chief object has been to obtain the maximum possible paying loads, and both bogie and four-wheeled wagons of high capacity and low tare weight have been more largely introduced in recent years. Special types of wagons have been introduced for special duties and improvements have particularly been made in the design of self-discharging wagons of the hopper and tipping type. Further interesting points are the introduction of the solid forged and rolled disk wheel, the adoption of high tensile steel for drawgear and the tendency to replace ordinary types of couplings with automatic couplers. (X.)

#### V. SIGNALLING

Since 1910 railway signalling (*see* 25.73) has made great strides and is now a very important part of a railway organisation. The modern signal engineer must be not only a mechanical but an electrical engineer, as both these branches of engineering play a most important part in the schemes of signalling as practised at the present time.

**Mechanical Signalling.**—There have been important evolutions in so far as the semaphore is concerned; the lever frame, however, remains much as it did in 1915. The system of tappet locking is in vogue in England; the so-called duplex locking is very little used, the locking being direct on the catch handle or in some instances on the lever only. The locking trays are usually fixed to the frame under the cabin floor and at an angle of 45° to 60° from the horizontal, in order to be more accessible. In Europe and America as well as the British Dominions and Colonies the same type of interlocking frame is used as in England, in so far as the general design and principles are concerned.

**Semaphore Work.**—The semaphore or fixed signal arms which inclined downwards to an angle of  $60^\circ$  for the clear position as shown in fig. 1 are gradually being superseded by those whose arms incline upward to  $45^\circ$  and  $90^\circ$  above the horizontal. The old type of semaphore is known as the "lower quadrant" and the new the "upper quadrant two-position and three-position." (See figs. 2 and 3.)

could not be more than 250 yards away. Points are now operated by double wires in Europe as well as in some of the British Dominions and Colonies.

Rodding transmission has been much improved in late years by the introduction of roller or ball bearings for cranks, compensators, rod rollers and chain wheels.

**Electrical Work.**—Safety electrical features are now added to mechanical installations. These are (1) a system of route locking to hold a certain set of points, as at a junction, until the train has passed over the facing points and is beyond the clearance point, (2) electrical disengagers which automatically set the signal to danger by the passing of a train, (3) electrical detection of facing points, which indicates in the cabin when the points are properly in position and bolt locked, (4) the use of track circuits in place of mechanical locking bars.

**Power Signalling.**—Power signalling such as the "All Electric" and the "Electro-pneumatic" are now very important in railway signalling. By its use points and signals can be operated a much greater distance from the cabins and very much faster. It is possible to close certain mechanically operated cabins, and in place of them operate from one centrally located power installation—with economy in operation and a more efficient service. By the use of track circuits and electrical controls on signals and points, and an illuminated diagram in the cabins, it is not essential that the signalman should have a view of the trains running over his section.

**Automatic Signalling.**—Automatic signalling has enabled engineers to increase their track capacity by 20% to 30% and to operate trains more cheaply than by the old system of lock and block, because by it many cabins may be eliminated. Automatic signals may be of the 2 and 3 aspect semaphore signals or the 2 and 3 aspect light signals. The fourth aspect is receiving some attention by signal engineers, and will no doubt soon be a standard on railways where traffic is dense.

**Light Signals.**—Light signals (figs. 4 and 5) can be seen as well in bright sunshine as at night. The long range signal for country districts has a special stepped lens 8 in. in diameter and is illuminated by a low voltage electric lamp with a special filament. The low range signal, as used for underground railways or in long tunnels, usually has a 6 in. stepped lens and the same type of lamp.

Light signals are much cheaper to instal and operate than mechanism semaphore signals and, their visibility being better than that of semaphores, they are being largely installed in the Dominions, Colonies and to some extent in England, and very largely in the United States of America.

**Track Circuiting.**—Track circuiting has become a necessary feature for power and automatic signalling, the most modern track circuits employing alternating current. By using this source of power, dangers from stray currents are almost entirely eliminated. (R. F. M.\*)

## VI. ELECTRIFICATION

**Electrification.**—Economic conditions during and following the War period emphasised to those countries poor in fuel supply their utter dependence on foreign countries for the fuel necessary for steam railway operation. Immediately after the Armistice many European countries decided to electrify their trunk lines without delay, and rapid strides are being made toward electric operation in such countries as France, Switzerland, Austria, Germany and Czechoslovakia. The advantages of railway electrification, the elimination of smoke, dirt and steam in tunnels and terminals, the increased capacity of track and the multiple unit feature of operation, are still important factors in favour of electrification, sometimes one and sometimes another being the controlling one.

The argument over the question of the best system to be used for electrification, which for many years retarded electrification, has been settled in many of the countries of Europe, either by governmental decree or by a mutual agreement of the railroads. In the United States of America, however, where so much has

FIG. 1.—"Lower Quadrant" semaphore. FIGS. 2 and 3.—"Upper Quadrant" semaphores. FIGS. 4 and 5.—Types of light signals.

Where the two-position upper quadrant is in use, it is the general practice to fix below it, if the block sections are short, the distant signal of the home signal in advance as shown in fig. 2, but where three-position upper quadrant signals are used, this arrangement of the distant signal is not necessary.

The first mechanical two-position upper quadrant signals used in the British Empire were on the railways of the Transvaal and Orange river in South Africa in 1902. Mechanical semaphore signals in England are still moved to the clear position by means of one wire, but in many other countries, particularly in Europe, two wires are used, one to pull the signal to the clear position and the other to return it to the danger or horizontal. In America, home and starting signals are operated by rodding, and distinct signals by two wires.

**Operation of Points.**—Mechanically operated facing points are moved by rodding as in the past, but they may now be 300 yards away from the signal cabin or lever frame. Formerly they

been done to develop both the continuous-current and the single-phase systems, the question is still unsettled. So many factors enter into the problem, the data as to first cost and operating costs are so conflicting and the relative values of the advantages possessed by the different systems are still so much a matter of opinion, that thus far no body of engineers has been able to make a decision on the subject that could be universally accepted. Local conditions and engineering, commercial and political considerations, all affect the decision in any particular locality, so that in America each railroad has thus far decided the question for itself.

#### SYSTEMS IN USE

There are three systems in general use for the electrification of railways, depending on the kind of current used: 1. The three-phase alternating-current system. 2. The single-phase alternating-current system. 3. The continuous or direct-current system. Each one has some advantage that appears to outweigh any possible handicaps or disadvantages that it may have.

*The Three-phase System.*—The three-phase system was the first real factor in trunk-line electrification, because when it first appeared there was no continuous-current railway in operation using more than 750 volts, universally admitted to be unsuitable for trunk-line work, and the single-phase motor had not yet been born. To Dr. Koloman von Kando of Budapest belongs the credit for the development of the three-phase system. It is used extensively and successfully in Italy, but in spite of the excellence of the equipment and the fine work that is really being done by over 400 three-phase locomotives, the verdict of the rest of the world seems to be against it. Engineers were attracted to it initially by the three-phase induction motor and the alternating-current transmission. The induction motor could be wound for the full line potential of 3,000 v. selected, and it had what appeared at that time to be the great advantage of a motor without a commutator. Alternating current on the trolley permitted the use of simple transformer substations which required no attendants.

The chief objections to the three-phase system lie in the double overhead contact lines which become very complicated in yards, limiting the potential to the order of 3,000 or 4,000 volts, and in the constant speed characteristics of the three-phase motor. The complications of the double-contact system are apparent, although they may easily be overestimated. The potential of 3,000 volts in general use is too low for an alternating-current system carrying heavy loads because the inductive drop in the lines causes too much fluctuation in line voltage unless very frequent transformer stations are used.

The constant speed, especially where each locomotive has two or three such speeds, is well suited to some classes of service but not to others. It facilitates adherence to schedules regardless of train load and grades. On the other hand there is danger of unequal division of load between motors, especially where a number of motive-power units are operated in the same train. Driving-wheel diameters must be maintained at the same diameter or the motors operated with resistance in the circuit. It is inflexible and gives a very bad load factor on a line where the grade changes frequently, since for any speed the load varies almost directly with the grade. On the other hand it has a special advantage in grade work, since in descending a grade the motors automatically become generators and the locomotive holds the train at a uniform speed by "regenerating" power which is returned to the line.

*The Single-phase System.*—The predominating advantage of the single-phase system lies in its utilisation of a single overhead contact wire from which alternating current at high potential may be collected. The prevailing potential in Europe is 16,500 volts, while in the United States of America 11,000 volts predominates with two trial instances of 22,000 volts. These voltages are so high that very little copper is required in the distributing circuits and the sub-stations require simply lowering transformers which may be, and usually are in modern installations, of the outdoor type. The single-phase system was made

possible through the invention by the late Benjamin G. Lamme of the low-frequency series compensated commutator type single-phase motor. On this motor or its modifications the system has always depended.

*Single-phase Commutator Type Motors.*—From the very nature of things, this is a difficult type of motor to build. Having an alternating field, the entire magnetic circuit must be laminated. In order to secure a good power factor, a small air gap and a compensating winding are essential. To avoid heavy transformer currents under the brushes at starting, which cause bad sparking and burning, the magnetic flux in the pole must be limited to a low value or resistance leads used between the armature winding and the commutator bars. All of these features combine to make a complicated construction with relatively large dimensions, great weight, low efficiency and high initial and maintenance costs.

With these limitations understood, thoroughly satisfactory and reliable motors have been developed. The difficulties decrease rapidly as the frequency is reduced. The standard frequency adopted for electrification in European countries is 16½ cycles per sec., as originally suggested by Lamme, and is suitable only for railway electrification. In America the low-frequency gained little support and the frequency of 25 cycles, the lowest standard frequency in use, was adopted for the single-phase railway. Aside from the motor, the single-phase car or locomotive is comparatively simple in view of the fact that transformer tapping is used for speed regulation. While the commutator-type motor is still considered the "first line of defence" and is used exclusively for multiple unit car equipments as well as for many locomotives in all classes of service, both the three-phase induction motor and the low-voltage continuous-current motors are used on locomotives under the single-phase trolley in the United States.

*Split-phase Systems.*—The three-phase induction motor when on what is known as the split-phase locomotive gives all the characteristics of the three-phase locomotive. It runs at a constant speed and regenerates automatically on descending grades. It avoids the complicated double overhead contact system but adds to each locomotive a rotating-phase converter by means of which three-phase current is obtained for operating the motors. Split-phase locomotives are used on the Norfolk & Western and the Virginian railways, two parallel lines from the coal fields of West Virginia to the seaboard. These locomotives are used for hauling heavy coal trains. The locomotives for the Virginian railway undoubtedly exert the greatest tractive effort of any locomotives in the world. Two locomotives, each capable of developing a tractive effort of 270,000 lb., move a train of 6,000 tons (2,000 lb. each) up a grade of 2% at a speed 14 m. per hour. In this class of service, the split-phase locomotive is notably successful. The constant speed characteristic, with the automatic regenerative braking, is very satisfactory, increasing both capacity of the line and safety of operation over those of steam operation.

*Motor-generator Type.*—The low-voltage continuous-current motor is used on what is known as the motor-generator type of locomotive, as an alternative to the split-phase for heavy freight work and to the single-phase locomotive in all classes of service. The motor-generator type really combines the best features of both the direct-current and the single-phase alternating-current systems. It utilises the direct-current series motor at its best for driving the locomotive and the high-potential single-phase trolley for its power supply. A lowering transformer and a motor-generator set consisting of a single-phase synchronous motor and a direct-current generator connect these two. Other advantages of this type of locomotive are:—Voltage control of the generator for acceleration and speed by varying the field of the motors to give constant output of the generator; the ability to regenerate within the capacity of the generator at practically any speed down to standstill; and high line-power factor. It will be noted that both the split-phase and the motor-generator type locomotives really carry rotating substations whose losses are added to that of the traction equipment.

*The Continuous or Direct-current System.*—The direct-current series motor is particularly well adapted to railway work by its variable speed characteristics and by its simple and rugged construction, its relatively light weight, small dimensions and high efficiency and comparative cheapness both in first cost and in cost of maintenance. About 1905 the direct-current system was limited to practically 600 volts. Large amounts of feeder copper were required in the line. The current that could be collected successfully from the overhead wire was limited to 300 or 400 amperes. Frequent sub-stations with motor-generator sets or synchronous converters were required, each with its attendants and, except in services with frequent trains, with a low load factor and consequent low average efficiency.

Under modern conditions voltages of 1,200, 1,500, 2,400 and 3,000 are in regular use with a single overhead contact line. With automatic sub-stations attendants are practically eliminated; sub-station machines are shut down when not needed; efficiency is increased and by spacing sub-stations at frequent intervals a great reduction in the amount of feeder copper required is effected. High-speed circuit breakers in sub-stations, by inserting a resistance in the circuit, minimise the damage resulting from short circuit on line or equipment. Owing to improvements in overhead construction and in current collectors, very heavy currents of as high as 5,000 amperes for experimental work and of 1,000 to 2,000 amperes are collected on the Chicago, Milwaukee & St. Paul Railway and elsewhere.

The steel tank mercury vapour converter is gaining ground for sub-stations, especially for higher voltages. This eliminates rotating machinery from the sub-stations, and has a very high average efficiency. It can take alternating current at any commercial frequency and convert it to direct current. It has been applied extensively for railway sub-stations in Europe.

The higher voltages increase the weight and cost of motors and the complications of the control equipment, particularly for voltages over 1,500, so that it is desirable, where the cost of motive-power equipments predominates in an electrification project, to use the lowest voltage that is feasible from the standpoint of current collection, especially for congested service. The mercury vapour converter, the high-speed circuit breaker and the heavy current-collecting devices have greatly increased the possibilities of the lower voltages.

A direct current of 1,500 volts has special advantages for congested service and has been adopted as standard by Great Britain, the Netherlands, France, Japan and Czechoslovakia, as well as by the Illinois Central Railroad in the United States of America. For long lines, however, with relatively infrequent trains and for very heavy trains, 3,000 volts seems to be the favourite for direct current electrification and has been adopted with notable success for several electrifications in the United States, Brazil, Chile, Spain, Mexico and South Africa. The first one of these, the Chicago, Milwaukee & St. Paul Railway in the United States has the longest route mileage electrified of any railway in the country. It crosses five mountain ranges and uses regenerative braking with excellent results. With direct current, regenerative braking may be utilised at practically any speed.

#### MECHANICAL DESIGN OF LOCOMOTIVES

*Drive.*—A great many radical schemes have been employed for the transmission of motor torque from the driving motors to the wheels. The type of drive and the locomotive arrangement are very largely governed by the type of motor used. The direct-current motor may be used with any known type of drive. It is usually applied, however, with one motor for each driving axle, utilising either direct gearing, a gearless arrangement or some system by which the entire motor weight is spring-borne.

Both the single-phase and the three-phase motors have their limitations. The dimensions and weight of the single-phase motor—except in very small sizes—make it imperative to have the entire weight of the motor spring-borne. It is, therefore, applied either with some form of quill drive or by the use of direct or geared side-rod drive. In the case of three-phase, it is very desirable to reduce the number of motors per locomotive to a

minimum. For this reason the three-phase motors have been applied exclusively with scotch yoke or side-rod drive, either geared or gearless.

*Wheel Arrangement and Cab Structure.*—The wheel bases and wheel arrangement of locomotives depend very largely on the type of motor and the form of drive. There are two general wheel arrangements: (a) a rigid frame similar to steam locomotives, with or without guiding trucks, and a cab mounted rigidly on the frame; (b) an assembly of two or more trucks, each with its equipment of motors, supporting a cab containing the control equipment, etc. This type is used both with separate swivel trucks like a car or with articulated trucks, the truck frames being coupled together.

The rigid-frame type has the advantage of simplicity but generally has a long rigid-wheel base. The truck type of construction has the advantage of much greater flexibility for curving and in providing better carrying springs.

*Power Supply.*—This varies greatly according to the local conditions in each instance. In the past a great majority of railroads have produced their own power, but for the future the tendency is toward the purchase of traction power from central station networks. This means that for the alternating-current systems a frequency for the railroad load is desirable that is an even multiple of the accepted distribution frequency. In Europe this has been secured by the adoption of 16 $\frac{2}{3}$  cycles, or one-third of the standard 50-cycle system in general use. In the United States the ratio of 60 to 25 is not so satisfactory.

*Diesel Electric Locomotives.*—There was in 1926 very important development in progress in the application of the Diesel oil engine to rail cars and locomotives, both in Europe and in America, and several locomotives have been built with engines of 1,000 to 1,200 H.P. capacity. The favourite method of connecting the

Table of World Electrification Giving Total No. of Locomotives and Electrified Route Distance in Each Country

| Country       | Voltage  | A.C. <sup>1</sup><br>or<br>D.C. | No. of<br>Locomotives | Route Distance<br>Approx. |       |

<sup>1</sup> A.C. = alternating current; D.C. = direct current; cy. = cycles; ph. = phase.

engine to the drive wheels seems to be by means of an electric generator and railway motors. This offers the most flexible and reliable means by which the speed and tractive effort may be varied to suit the conditions.

The Diesel electric system seems to be well suited for use on rail cars, where engines of 250 to 400 H.P. are required, and on slow-speed locomotives used in switching and freight service. The advantages of this type lie in fuel economy, comparative freedom from smoke, dirt and noise and in greater availability for service, it should prove to be a strong auxiliary in the electrification of the steam railways.

*General.*—The table on p. 293 contains a summary of the principal main line railroad electrifications of the world as they were on Jan. 1 1926. Multiple-unit car equipments are used extensively on the electrifications in Great Britain, Australia, Japan and the United States of America, and almost all of the suburban passenger traffic on the electrified railroads in the cities of London, New York, Philadelphia, Tōkyō and Melbourne is handled by such equipment.

**RAILWAY STATIONS** (see 22.839).—The completion of the Pennsylvania (New York) and Grand Central (New York) stations, in 1910 and 1913 respectively, marked the most important epoch in the history of passenger station design. It witnessed, for cities of major importance, the passing of the old style single purpose passenger station buildings, the introduction of dual purpose buildings in locations where land values were high, and the intensive development of the so-called "air rights," thus permitting of expenditures not warranted from a purely railway operating viewpoint.

Both these stations were designed for electric operation, insuring the elimination of the smoke and gas incident to steam-operated layouts and permitting the tracks to be depressed and covered over, with the consequent practicability of the utilisation of space over the yard for private and public buildings. While the advantages of electrification have been demonstrated in the operation of these stations, recent developments in passenger station design and operation seem to have proved that many features first introduced in the electrified stations mentioned can, with proper design, be duplicated in steam operated layouts. This is particularly true of the Chicago Union station, a project which had its inception about 1910, but was completed only in June 1925.

*Chicago Union Station.*—As this station is the latest and one of the most interesting of all large stations, it is described here in some detail. It serves as a terminal for four railways—the Chicago, Burlington and Quincy; the Chicago, Milwaukee and St. Paul; the Pennsylvania system (these three as owners) and the Chicago and Alton (as tenant). Like the Grand Central station, the Chicago Union station is designed to serve two purposes: as a station and as an office building. It is the only station in America of major importance where passengers and baggage are handled on separate platforms, an arrangement making it possible to dispense with baggage elevators between the different trucking levels, these being connected by ramps. It embodies the most complete facilities for handling mail of any railway station in the world. Its design is marked by an entirely new type of train shed and an ingenious arrangement of interior driveways and platforms which make the use of the city street space unnecessary in the handling of mail and passengers' baggage. It is also one of the few large passenger stations in the world where the waiting-room, the concourse and the platforms are on the same level.

The over-all dimensions of the station proper, or head house, are 320 ft. by 372 feet. The main waiting-room occupies the central court. Because of the necessity of carrying the streets over the tracks, the floor of the main waiting-room is depressed below street-level, thus securing the advantages of a common level for the station and the tracks. Necessary inequalities of level are taken care of by almost imperceptible slopes in the floor of the concourse between track grids. While the design of the station provides for greater ultimate development of railway land than any similar project ever undertaken, only eight stories of office building over the station have been completed as yet. Ultimately the office structure will be carried up to a total height of 25 stories. The design is such that there is a complete segregation of station and office functions in the building, this being accomplished by the depression of the station facilities below street level, the use of six steps up from street level to the office building loggias and the provision of entrances to the office building as remote as possible from the entrances to the station. The office building loggias open into entrance lobbies at the ends of the waiting-room; the lobbies are at an elevation of about 14 ft. above the level of the waiting-room floor, giving the effect of balconies. The station is the only double stub layout in the United States, the tracks being arranged in two groups separated by the concourse. The tracks vary in capacity, accommodating 7 to 18 car trains, the track group to the south having a capacity of 191 cars, and the group to the north a capacity of 141 cars. Through tracks, east of the station tracks proper, provide connection between the two groups. This arrangement also provides access to the mail terminal tracks for trains or cars entering or leaving the station by either of the two—north and south—approaches.

A feature of the station track layout is the provision of a platform on each side of each track. Alternate platforms are used by passengers and for baggage handling. This permits giving platforms the elevations best suited to their particular uses. However, the chief advantage of the separate platforms for baggage and passengers is direct access from the baggage platforms to the baggage-room (located in the basement level) by means of ramps sufficient in width to permit the operation of baggage trains in both directions—up and down—simultaneously.

The mail terminal building is 75 ft. wide and 796 ft. long; it encloses 11 ac. of floor area and has a cubical content of 8,500,000 cu. ft.; it was designed to handle 3,000 tons of mail in 24 hours. It is distinguished by its mechanical equipment, including 65 conveyor belts totalling seven m. of belting, overhead trolley conveyor systems, spiral chutes and other devices which provide for the elimination of manual labour in the handling of mail.

The train shed provided in this layout is of an entirely new type, designed to give adequate protection from the weather, to give more than the usual headroom found in low-type sheds, and to keep the trucking platforms free from supporting columns. This involves a transverse span of nearly 50 feet. To avoid deep transverse girders to carry the roof load a heart-shaped truss was developed. With the use of such trusses over each column it was possible to secure the desired headroom, particularly efficient lighting and ventilation, and a shorter effective span of the transverse girders. To keep the passenger platforms as free as possible from obstructions, the supporting columns for the roof were spaced at nearly 42 ft. centres. A smoke slot over the centre of each track placed at a height to clear the stacks of locomotives allows the smoke and gas from engines to be dissipated into open air.

TABLE I.

| Station               | No. of tracks | Trains per day     | Passengers per day |
|-----------------------|---------------|--------------------|--------------------|
| Grand Central, N.Y.   | 25            | 418 <sup>1</sup>   | 100,000            |
| Pennsylvania, N.Y.    | 21            | 558 <sup>1</sup>   | 101,400            |
| South, Boston         | 28            | 660                | 120,000            |
| Union, Chicago        | 24            | 300                | 65,000             |
| Leipzig               | 26            | 400                | 85,000             |
| St. Lazare, Paris     | 31            | 1,200              | 250,000            |
| Liverpool St., London | 20            | 1,018              | 242,000            |
| Waterloo, London      | 21            | 1,261 <sup>2</sup> | 140,000            |
| Northwestern, Chicago | 16            | 314                | 74,700             |

<sup>1</sup> Normal.

<sup>2</sup> Normal winter service (1925-6). The number is greatly increased in the summer.

*British Railway Stations.*—In Great Britain very little was done during the period under review (1910-26) in the way of building new railway stations; consequently no English station is included in Table II. The most considerable undertaking was the replanning and enlarging of Waterloo Station, London, the headquarters of the Southern Railway, which was opened formally by H.M. Queen Mary on March 21 1922. The platforms are about 700 ft. in length, of which 540 ft. is under cover. The area covered is 560,000 superficial feet. 1,000 tons

TABLE II.

| Station                   | Date completed | Dimensions of main building | Cost <sup>1</sup> |
|---------------------------|----------------|-----------------------------|-------------------|
| Washington, D.C.          | 1907           | 663x211 ft.                 | \$120,000,000     |
| Pennsylvania, N.Y.        | 1910           | 430x784 "                   | 115,000,000       |
| North-western, Chicago    | 1911           | 320x218 "                   | 24,000,000        |
| Grand Central, N.Y.       | 1913           | 673x301 "                   | 150,000,000       |
| Ottawa, Canada            | 1912           | 281x141 "                   |                   |
| Michigan Central, Detroit | 1914           | 345x266 "                   | 7,000,000         |
| Kansas City               | 1914           | 510x150 "                   | 55,000,000        |
| Havana, Cuba              | 1914           | 240x80 "                    | 400,000           |
| Buenos Aires              | 1916           | 700x604 "                   |                   |
| Tokyo                     | 1914           | 1,083x132 "                 | 1,400,000         |
| Leipzig                   | 1915           | 984 "                       |                   |
|                           |                | (Frontage)                  | 32,130,000        |
| St. Paul, Minn.           | 1922           | 315x220 ft.                 | 20,000,000        |
| Union, Chicago            | 1925           | 320x372 "                   | 75,000,000        |

<sup>1</sup> Includes entire cost of terminal development.

of glass and about 60 m. of metal glazing bars, weighing 95 tons, were used. The reconstruction scheme involved the clearance of a large area and the rehousing elsewhere of the population. The main "A" signal box is one of the largest in the world, and about 24,000 lever movements are performed every 24 hours. The traffic is both steam and electric.

**Leipzig Station.**—The Leipzig (Germany) station, completed in 1915, has a frontage of 984 ft. and occupies an area of 172,000 sq. feet. The train shed has a high roof of steel and glass, built in the form of six arches; it is 785 ft. long, with an area of 710,500 square ft., and covers 26 tracks. The station serves as a junction for the passenger traffic of Magdeburg, Thuringia and Dresden, and the larger part of the traffic between Prussia and Saxony passes through it. The Leipzig station is the largest, though not the busiest, station in Europe. It is smaller than the Grand Central and Pennsylvania stations in New York, and handles considerably less traffic than the Gare St. Lazare (Paris), the busiest station in the world.

**Retiro Station, Buenos Aires.**—The Retiro station of the Central Argentine railway at Buenos Aires, said to be the finest station in South America, was opened in the latter part of 1915. The terminal, including buildings, train sheds and approaches, occupies 744,000 sq. ft., and in point of size and design compares with any of the newer stations elsewhere.

**Tokyo Central Station.**—The Central railway station in Tokyo, completed in 1915, was erected at the very small cost of \$1,400,000; in the West it would have cost 10 or 20 times as much. The explanation lies in the extremely low price paid for Japanese labour, 20 cents a day (of 10 to 12 hours) for common labourers, and \$25 a month for carpenters and masons. Estimated in days' labour, the cost was 730,000 labourer-days. The main building is of brick and granite, 1,083 ft. long, 66 to 132 ft. wide and 54 ft. high, with a dome (152 ft.) at either end. The terminal took the place of three stations which formerly served the three main-line Government railways (J. G. L.)

**RAKOVSKY, CHRISTIAN GEORGIEVICH** (1873– ), Russian politician and diplomat, of Bulgarian descent and Rumanian nationality, was born Aug. 13 1873 at Kotel, Bulgaria. His father's home in the Dobruja passed after the Russo-Turkish War to Rumania and the family became Rumanian. Rakovsky's Bulgarian ancestors, especially his grandfather, had organised risings against the Turkish rule, and the revolutionary traditions of the family were revived in Christian Rakovsky. His revolutionary career began in his college days, when in 1890 on account of his socialist activities all schools in Bulgaria were closed to him. He therefore went to Geneva, where he joined the International Social Democratic Student movement and came in contact with Plekhanov and other Russian Social Democrats; and also to Germany, where he met Liebknecht. He was expelled from Prussia in 1894; went to France, where he graduated as a doctor of medicine at Montpellier, and wrote his famous thesis on *The Etiology of Criminality and Degeneration* (1897), upholding the Marxian conception of crime as a result of economic conditions, in opposition to the Lombroso theory of the

atavistic criminal type. He also studied law, and took an active part in political journalism. Returning to Bulgaria, he recommenced revolutionary activities, and in *Russia in the East* (1898), denounced Tsarist politics. In 1900 he served his term as an officer in the Rumanian Army. During the peasant riots of 1907 he was expelled from Rumania, his title to Rumanian citizenship not being considered adequate, and his civil rights were only restored in 1912. The five years of Rakovsky's exile were interrupted by illicit homecomings and consequent labour troubles; the question of his citizenship became a *cause célèbre*, political parties being sharply divided on the issue, and the whole of the Radical press in Europe supported his claim.

After Rumania entered the World War Rakovsky was arrested and imprisoned in various places, and finally at Jassy, whence he was released by the Russians on May 1 1917. Kerensky's Government was hostile to him, and it was not until after the Soviets came into power in Nov. that he joined the Government. Rakovsky had lived in St. Petersburg in the past, and but for the persecution of the Tsarist government would have settled there. He was well known as a writer on political and economic subjects under the pen name of "Insarov," and a number of his books were written and published in Russia (*Modern France*, 1900; *Metternich and His Time*; *Turkey and Macedonia*, etc.).

Rakovsky's diplomatic career began with his appointment as head of the delegation entrusted with the peace negotiations with the Ukrainian Central Rada. In 1919 he was appointed President of the Soviet of People's Commissars of the Ukraine, and in 1922 represented Russia at the conference of Genoa. In 1924 he was the Soviet chargé d'affaires in London, and as such negotiated a treaty between the Soviets and the British Labour Government. The treaty, however, was subsequently rejected by the succeeding Conservative administration. In 1926 he was appointed Soviet ambassador to France, and became a member of the Central Committee of the Council of the People's Commissars. (Z. V.)

**RAMON Y CAJAL SANTIAGO** (1852– ), Spanish histologist, was born May 1 1852 at Petilla de Aragon (Pamplona). He graduated at the University of Saragossa, and went in 1881 as professor to the University of Valencia, and in 1886 to Barcelona, publishing in 1889 his first important work (*Elementos de Histología normal y de Técnica Micrográfica*). In that year he discovered "the laws which govern the morphology and the connections of the nerve cells in the grey substance." In the years 1890 and 1891 he discovered the primary changes of the neurin, and the genetic unity of the nerve fibres and the protoplasmic appendices. During this period of his career he discovered the axis cylinder of the fibres of the cerebellum and their continuity with the parallel fibrillae of the molecular covering, formulated the principle of the dynamic polarisation of the neurins, aided by Van Gehuchten, and worked upon the analysis of the sympathetic ganglia. In 1892 he took the chair of normal histology and pathological anatomy in the University of Madrid. In 1894, on the invitation of the Royal Society of London, he developed systematically his views on morphology and connections of the nervous cells of the spinal medulla, ganglions, cerebellum, retina and olfactory bulb. In 1899 he was called upon by the Clark University (Worcester) to give an exposition of his investigations regarding the cerebral tegumen, and in 1900 the International Congress of Medicine, which met in Paris, gave him the Moscow International Award. He was awarded half the Nobel Prize for medicine in 1906. His work in three volumes, *Histologie del Sistema Nervioso de Hombre y de los Vertebrados*, appeared between the years 1897 and 1904. In May 1922 he was exempted, on account of long service, from his duties in connection with the chair which he held, and, on the initiative of the Government, he founded the Cajal Institute in Madrid.

**RAMPOLLA, COUNT MARIANO DEL TINDARO** (1843–1913), Italian cardinal (see 22.877), died in Rome Dec. 17 1913.

**RAMSAY, SIR WILLIAM** (1852–1916), British chemist (see 22.880), died at High Wycombe, Bucks., July 23 1916. In 1904 he was awarded the Nobel Prize and in 1911 was president of the

British Association. In 1913 he resigned his professorship of chemistry at University College, London.

**RAMSGATE**, England (*see* 22.881), with a population in 1921 of 36,560 and an area of 2,306 ac., retains its picturesque features, though it is a growing place. The district beyond the West Cliff is being developed as a western suburb, and the parade nearly reaches Pegwell. Eastward it has been carried as far as East Cliff Lodge, and the cliff above laid out as gardens. A western undercliff promenade was opened in 1925, and there is a concert hall below the West Cliff promenade. Extensive measures of cliff protection have been necessary both east and west of the town. Fifty acres of land were bought for a recreation ground in 1924, and the site and money for another were given in 1925. A gun from a German submarine has been placed in Nelson Crescent, and a War Memorial erected in Albion Gardens. Chatham House, a Canadian hospital during the War, has been bought by the county education committee, and is used in part as a county school.

During the War a large aerodrome was established at Manston, two miles from Ramsgate. Both railway stations are to be closed, and a new station built at St. Laurence;  $1\frac{1}{2}$  m. of line, to connect with the line to Broadstairs, will be constructed and the present branch to Margate and part of the line to the Harbour Station closed. During the War 93 bombs were dropped on Ramsgate. Considerable damage was done, but casualties were light.

**RANDEGGER, ALBERTO** (1832-1911), Italian musical composer and conductor, was born in Trieste April 13 1832. He studied piano under Lafont and composition under L. Ricci. After conducting opera at Fiume, Venice and other Italian towns, he settled in London in 1854. He became professor of singing at the Royal Academy of Music in 1868 and at the Royal College of Music in 1896. He was conductor of the Carl Rosa Co. from 1879 to 1885 and conducted the Norwich Festivals 1881-1905. Randegger, who died in London on Dec. 18 1911, did much towards the popular revival of opera in England. His works include *Bianca Capello* (1854, opera) *The Rival Beauties* (1864 comic opera); a setting of the 150th Psalm; *Fridolin* (1873, dramatic cantata); and also a valuable *Primer on Singing*.

**RANGE-FINDER** (*see* 22.888).—Range-finders or position-finders, as they are sometimes called, are used both in land and sea warfare.

### I. MILITARY RANGE-FINDERS

The range-finder usually consists of two main parts, viz.: a strong outer tube and an inner frame which supports the delicate telescopic system, any slight derangement of which would seriously upset the accuracy of the range-finder. The outer tube is made as strong and rigid as possible, having regard to the weight which can be allowed. The inner frame is supported in such a way that any slight bending of the outer tube will not affect it.

Some form of double end reflector is always used. This at one time consisted of a pentagonal prism, but large pentagonals are very costly; they absorb a good deal of light and are liable to slight distortion with changes of temperature. There is therefore a tendency to replace them by a combination of two silvered plane mirrors inclined to one another at  $45^\circ$ , and either fixed in a mount made of a metal having the same coefficient of expansion as glass, or rigidly attached to an upper and lower glass support, to prevent change in their relative positions.

The central reflectors usually take the form of two or more prisms balsamed together, and are known as the centre prism combination. Their object is to deflect the rays received through the two ends of the range-finder into the eye-piece, and to present the two images of the target in the field of view immediately above and below a thin separating line.<sup>1</sup>

*Stereoscopic Range-Finders*.—The principle of the stereoscopic range-finder is entirely different. Stereoscopic range-finders have not found much favour in the British services; but they have

been extensively used by the Germans. Speaking generally, a stereoscopic range-finder contains the elements of a stereoscopic telescope rigidly mounted in a tube. It is very similar in outward appearance to a coincidence range-finder with two eye-pieces. Objects viewed through a stereoscopic range-finder are seen to stand out in stereoscopic relief; and it is comparatively easy for the observer to judge their relative distances. The actual distance of a target is obtained with the assistance of one or more marks which are seen in stereoscopic relief in the field of view. By means of suitable optical arrangements the stereoscopic relief of either the objects in the field of view or of the mark can be varied until the target and mark appear to the observer to be the same distance away from him. The range of the target can then be read off a range-scale attached.

### FOR COAST DEFENCE

Coast defence range-finding instruments may be divided into classes, depending upon the nature of their bases, as follows:—

1. Depression instruments, having vertical bases (either range-finders or position-finders) the accuracy of which depends upon their height above the sea-level. It is usually considered that, to obtain ranges with an error not exceeding 1%, 100 ft. of height is required for every 5,000 yd. of range. All that the range-taker has to do is to keep a cross wire in the telescope of his instrument laid on the water line of the target.

2. Instruments having a fixed horizontal base (usually position-finders). Each usually consists of two instruments installed at the ends of a base which may be several thousand yards in length, the length required depending upon the range and arc of fire of the gun for which the instrument has been installed. The instrument at one end of the base is known as a transmitter and usually consists of a telescope mounted above an azimuth circle. It measures the bearing of the target and transmits it to the instrument at the other end of the base which is known as the receiving instrument. The bearings may be transmitted by telephone; or, as the telescope is traversed, electric impulses may cause some portion of the receiving instrument, e.g., a metal arm or a dial, to move automatically. The receiving instrument is usually an accurate, solidly constructed plotter, made to a certain scale, e.g., 500 yd. to an inch. In its simplest form it would consist of a base plate upon which two straight arms were pivoted, the relative positions of the pivots being, to the scale of the instrument, the same as those of the transmitter and receiving instrument. The first arm would be kept set to the azimuth angles received from the transmitter, and the second arm would be kept in line with the target by means of a telescope attached to it. The point where the two arms intersect would represent the relative position of the target. The arms being graduated in ranges and moving over azimuth scales, the range and bearing of the target from either end of the base could be read off. By means of a third arm, pivoted to the base plate in the position representing the position of the gun, the range and bearing of the target from the gun could be ascertained if the arm were brought above or below the point of intersection of the two other arms.

3. One-man range-finders used for coast defences are constructed on the same general principles as those used in the field; but, as their weight and size need not be limited to the same degree, many modifications to make them as accurate and convenient as possible are introduced. Their base lengths are usually between 9 ft. and 10 metres, but even longer bases have been considered. They are practically always of the coincidence type with both fields erect.

The Mark III. Depression Range-finder will be taken as a type of a depression instrument. In this range-finder the range-finding triangle is reproduced in the instrument on a small scale. Fig. 1 shows diagrammatically how this is effected by means of two arms.

FIG. 1.—Diagram of the principle of the two-arm range-finder.

AB represents the height of the axis of the telescope above the surface of the sea BC. Ab represents the distance between the pivot of the telescope arm Ac and the range arm bc, and this to the scale of the instrument, represents the height AB. When the instrument is level, the arm cb is horizontal, and therefore parallel to the surface of the sea. cb is subdivided and graduated in equal divisions

<sup>1</sup> A very complete account of the construction and accuracy of this type of range-finder will be found in vol. 4 of the *Dictionary of Applied Physics*.

bridge, where he leaped into eminence as a cricketer, subsequently becoming familiar to the British public by the affectionate designation of "Ranji." He first played for Sussex in 1895 and in 1897-8 he was a member of the Stoddart all-England eleven which went to Australia. He headed the English batting averages in 1896 and again in 1900. On his cousin's death in 1907 he succeeded as chief of the state of Navanagar, in the Bombay Presidency of India, and quickly developed into an enlightened and sagacious ruler. During the early part of the World War, he provided troops for the Allies, and himself served at the front in France. He represented the Indian States on the League of Nations Assembly in 1920 and became vice-chancellor of the Indian Chamber of Princes. He wrote *The Jubilee Book of Cricket* (1897); *With Stoddart's Team in Australia* (1898); *Cricket Guide, and How to Play Cricket* (1906). See P. C. Standing, *Ranjitsingh, Prince of Cricket* (1903).

**RAPALLO, TREATY OF** (April 16 1922).—During the Conference of Genoa (see GENOA, CONFERENCE OF), at which it was designed to consider the economic relations of the participating Powers with Russia, the Russian delegates showed no great desire to resume relations with the Allied and Associated Powers, but to the consternation of the latter signed an agreement with Germany, after secret negotiations. The Treaty was initialled on April 16 1922 by M. Chicherin and M. Rathenau. Germany and Russia renounced reciprocally all claims to war indemnities of any sort, including payment for the maintenance of prisoners of war. Germany renounced any compensation for losses incurred by German subjects in consequence of Russian socialisation of private property "provided that the Soviet Govt. does not satisfy similar claims of other States." Diplomatic and consular relations were resumed, the principle of the most favoured nation was to be mutually applied, with a Russian reservation in favour of States formerly belonging to the Russian Empire. Economic relations were to be regulated "with mutual feelings of goodwill." The Treaty was made public immediately on signature (English translation is printed as a British White Paper, Cmd. 1637 of 1922), and it was emphatically denied that it contained any secret political or military clauses. On Nov. 5 1922 the Treaty was extended to the Ukraine, White Russia, the Transcaucasian republics and the Far Eastern republic.

**RÁŠIN, ALOIS** (1867-1923), Czechoslovak statesman, was born at Nechanice. While at the university he took an active part in politics, and his abilities as an orator, journalist and organiser brought him into the forefront of the Czech progressive movement. His anti-Austrian activities brought him into conflict with the authorities; he was tried in connection with the "Omladina" affair in 1893 and condemned to two years imprisonment and the loss of his doctorate. After serving his sentence he gained a prominent position in the Czech Liberal ("Young Czech") party, which he represented both in the provincial diet of Bohemia and in the Austrian Reichsrath. During the anti-Czech persecution in the World War period, Dr. Rašín, together with Dr. Kramar, was arrested in 1915, charged with treason and condemned to death. The sentence, however, was not carried out, and after the accession of the Emperor Karl, Dr. Rašín, with other political prisoners, was amnestied. He then took part in the preparations for the revolutionary coup in 1918, which, as a member of the National Committee, he helped to bring about. In the first Czechoslovak Govt. he became Finance Minister and rendered inestimable services to his country by freeing the Czechoslovak currency from that of Austria and inaugurating a financial policy which led to the stabilisation of the Czechoslovak crown. He described his achievement in a book entitled *Financial Policy of Czechoslovakia During the First Year of its History* (1921, Eng. trans., 1923). In January 1923 he was attacked by a demented youth and died of his injuries six weeks afterwards, on Feb. 16 1923.

**RASMUSSEN, KNUD JOHAN VICTOR** (1879- ), Danish explorer, was born at Jakobshavn, Greenland, June 7 1879. In 1902 he made the first of several expeditions to Greenland

and the northern polar regions. Between 1905 and 1924 Rasmussen visited all the extant Eskimo tribes and ascertained that they were originally Red Indian tribes which had wandered east and west from the coast. Rasmussen, whose ancestors in the maternal line were Eskimos, gained a thorough knowledge of arctic peoples and customs and made them the subject of numerous tracts and publications, including *Nye Menesker* (1905); *Myter og Sagn fra Gronland* (1921) and *Gronland Langs Polhavet* (1919). The last mentioned work has been translated into English by G. A. and R. Kennedy as *Greenland by the Polar Sea* (1921).

**RASPUTIN, GREGORY EFIMOVITCH** (1871-1916), Russian monk, was born in 1871 in the village of Pokrovskoe, near Tyumen, in the province of Tobolsk, Siberia. He was the son of a poor peasant whose disorderly behaviour resulted in his being given the name of Rasputin, meaning "debauchee." He received no education, and till the end of his life was unable to write properly. He spent the first part of his life till the age of 33 in his native village; he married in 1895 a well-to-do girl, Olga Chanigoff, and they had two daughters and a son. In 1904 Rasputin resolved to change his mode of living. He left his family and devoted himself to religious exercises, declaring to his people that he was inspired by God. His passionate nature, his great physical strength and the superstitious atmosphere in which he had been brought up, gave an unexpected direction to his religious exaltation. He adopted the views of the sect known under the name of "Khlysty," the leading idea of whose teaching was that salvation could be achieved only by repentance.

"Sin in order that you may obtain forgiveness"—was the practical rule which he drew from this doctrine. "A particle of the Supreme Being is incarnated in me"—he told his hearers. "Only through me you can hope to be saved; and the manner of your salvation is this: you must be united with me in soul and body. The virtue that goes out from me is the source of light, the destruction of sin" (E. J. Dillon, *The Eclipse of Russia*). This extravagant and dangerous teaching, which resulted in practice in the most wild orgies, not only created for Rasputin immense popularity and the reputation of a holy man among his fellow-peasants, but opened before him the doors of some of the most fashionable Russian houses and even those of the Imperial Palace. Looking for new experiences Rasputin left his native village, and made long pilgrimages to various holy places, and even went to Mount Athos and Jerusalem. He spent some time in different monasteries and applied himself to the study of holy books, but his lack of elementary education reduced the results of his labours almost to nothing. He only retained by heart some incomprehensible passages, and often used them in his prophecies. He had, however, a strong magnetic power, the influence of which was recognised by his bitterest opponents.

In 1907, during a stay in St. Petersburg (Leningrad), Rasputin was introduced to the Archimandrite Feofan, rector of the Theological Academy and confessor to the Empress, who took an interest in the story of his conversion. The Archimandrite, with the assistance of the Grand Duchesses Militza and Anastasia, presented Rasputin at Court, and he produced a deep impression on the Empress and Emperor. The mystic atmosphere which always prevailed at the Russian Court, and which was especially strengthened by the disasters of the Japanese War, the internal troubles in 1905 and the constant fear for the health of the Tsarevich, created a convenient background for the appearance of such a man. His disdain for all rules of good behaviour, his dark prophecies, and, above all, the eventual improvement in the health of the Grand Duke Alexis, which more than once seemed to result from his influence when medicine was ineffectual, created an exceptional position for him with the Empress. Disgusted with the Russian intellectual classes and the bureaucracy, she saw in Rasputin the representative of the mass of peasantry, the only sure support of orthodoxy and autocracy, specially sent by God to save the heir to the throne and preserve the dynasty.

Rasputin took advantage of this belief, and did his best to

persuade the Empress that his fate was closely tied with that of the imperial family. The example of the Court was followed by a large section of the upper class, and many doors were opened for the "Saviour," as the Empress used to call him. For some time Rasputin was satisfied by this side of his social success, and at first he did not interfere in politics. But his activity was felt in church questions. His friendship with the famous monk, Heliodor, and the Bishop of Saratov, Hermogen, which resulted in a complete rupture between them and in a series of scandals, had a painful echo in the country. The appointment of Varnava, an illiterate peasant and a friend of Rasputin, to be Bishop of Tobolsk in 1911, and the extraordinary servility with which the Holy Synod followed the wishes of the favourite, provoked a strong opposition among all classes of society. The most prominent upholders of orthodoxy demanded a complete reorganisation of the Russian church, and denounced the servile attitude of the Holy Synod. Guchkov, the Octobrist leader, in a famous speech delivered at the state Duma, made direct allusions to the nefarious influence exercised by Rasputin. But the influence of the "Saviour" was too strong to be checked by any expression of feeling in the country, and Rasputin triumphed over all his enemies.

An unsuccessful attempt to kill him, made by a certain Guseva in 1914, incited by the monk Heliodor, only strengthened his influence, which became especially powerful during the two last years of the imperial régime. No important nomination was made without his approval, and the most unexpected people rose to the highest offices as the result of his interference. Rasputin was too ignorant to have any opinion on political questions: he was in most cases an instrument of the reactionaries. Numberless stories of the debauchery practised at the Court, in which the name of Rasputin was coupled not only with some of the court ladies but even with that of the Empress herself, became a common topic of conversation in all classes of Russian society. At length a supreme effort to free the Empire and the dynasty from his influence was made by a small group of men of the highest social position, which included the Grand Duke Dimitri Pavlovich, Prince Yussupoff and M. Purichkevich. Rasputin was invited to a supper at the Yussupoff Palace on Dec. 15 1916, and shot dead, after an attempt at poisoning him with a strong dose of potassium cyanide mixed with wine had not produced the desired effect. His body was thrown under the ice of a canal. The death of Rasputin was a terrible shock to the Empress; she transferred his body to the park of Tsarskoe Selo, where a special chapel was erected, and came every night to pray on his grave. The Grand Duke Dimitri Pavlovich was sent to Persia to join a fighting column. Yussupoff was ordered to leave St. Petersburg (Leningrad) and interned in his estate. Purichkevich, protected by his immense popularity in the army and by his title of member of the Duma, returned to his work on the front. (P. VI.)

See *Letters of the Tsaritsa to the Tsar 1914-6* (1923); and further letters published in *The Manchester Guardian*, Jan. 9 and Feb. 7 1924.

**RATHENAU, WALTHER** (1867-1922), German statesman and industrialist, was born in Berlin Sept. 29 1867, the son of Emil Rathenau, the founder of the Allgemeine Elektrizitäts-Gesellschaft. After studying philosophy, physics and chemistry at Berlin and Strasbourg he graduated in 1889, and spent a year studying machine structure and chemistry at Munich. He was then engaged as a civil engineer by the Aluminium Industrie A.-G. of Neuhausen, Switzerland.

In 1893 he became a director of the Electrochemische Werke G.m.b.H. at Bitterfeld for the utilisation of a process for making chlorine and alkalis by electrolysis. He also built large works at Rheinfelden, in Russian Poland, and in France, and elaborated processes for the production of ferrosilicate, chrome, soda and magnesia. In 1899 Rathenau became a director of the Allgemeine Elektrizitäts-Gesellschaft, and built central stations at Manchester, Amsterdam, Buenos Aires and Baku. In 1902 he belonged to the board of directors of about 100 enterprises. During 1907 Rathenau accompanied Dernburg, the Secretary of State of the Imperial Colonial Office, to German East and West

Africa, and also visited the British Colonies in Africa. His *Reflexionen* (1908) contain his two final reports on those visits. The year 1912 marked his first public appearance in politics. He published *Zur Kritik der Zeit*, in which he subjected the existing social and economic order to severe criticism. His fundamental philosophic work, *Zur Mechanik des Geistes*, appeared in 1913.

Even at the beginning of the World War Rathenau realised the whole extent of the danger which the British blockade meant to Germany as regards raw material. In an astoundingly short time, with the acquiescence of the War Minister Von Falkenhayn, he established a huge organisation for the administration of the war raw materials then at Germany's disposal. This Board of the War Ministry, called the "Kriegsrohstoff-Abteilung," which he left in splendid working order to his successor on March 31 1915, alone made it possible for Germany to hold out with raw material till the end of the War.

After his father's death in the summer of 1915 Rathenau was made president of the Allgemeine Elektrizitäts-Gesellschaft, to which he devoted his best energy. During this time he published *Von Kommenden Dingen* (Eng. trans. *In Days to Come*), *Eine Streitschrift vom Glauben und Vom Aktienwesen*. In 1918 his collected works were published. After the War Rathenau endeavoured to found a middle-class Democratic Party which was to bridge the gulf between the middle classes and labour caused by the revolution, and in this way to restore to the country its unity. In 1919 he was called by the government to participate in the preliminary preparations in Berlin for the Conference of Versailles. From April 1920 to May 30 1921 Rathenau was a member of the so-called "Socialising Commission" convoked by the newly founded "Reichswirtschaftsrat" in order to discuss the question of nationalising the coalmines. In the summer of 1920 he submitted to the public his report on this question, in which he proposed to hand over the privately owned coal-mines to the state with a reasonable compensation and within a space of about 30 years.

He was appointed government expert at the Spa conference of July 1920, and in the spring of 1921 took part in the preliminaries to the London Conference. At the end of May 1921 he was asked by the Chancellor Wirth to join the government. The two leading men of the Cabinet thus formed, Wirth and Rathenau, were united by deep confidence and friendship. The combination of the Chancellor's original and impulsive nature, his courage and love of responsibility, was a happy blend with Rathenau's far-sighted and extraordinary capability.

Rathenau as well as the Chancellor realised that the chief task was how to bring about a better understanding abroad of Germany's real position, thereby annulling her complete isolation, just once more revealed at the London Conference (April-May 1921) and leading to a "reasonable solution" of the reparation problem. This policy of mutual understanding was to secure peace for Germany, Europe and the world, a peace absolutely necessary for the reconstruction of what had been destroyed. In a speech made at Stuttgart a fortnight before his death Rathenau characterised the task allotted to him as follows:—

When in a space of 100 years the history of this epoch will be written, then the question will be carefully investigated: Where were the first threads of peace tied? How was it possible in a world poisoned by hatred and on a planet flaming with the passion of mutual revenge, in a world of destruction and dissension to knit the first threads? The answer will be: The German nation has united these threads by its patience, its energy, its positive will, its idealism, by its sense of sacrifice.

In this spirit Rathenau co-operated in the final conclusion of the Peace Treaty with the United States of America in Aug. 1921. As Minister of Reconstruction he concluded with Loucheur, the French Minister of the Régions Libérées, an agreement at Wiesbaden, securing to France the privileged supply of deliveries in kind as reparation payment, which contributed greatly to the relaxing of the tension between France and Germany. However, this fact did not, unfortunately, react on the Upper Silesian decision of the League of Nations. The

disruption of the Upper Silesian coal and iron district, quite contrary in German opinion to the Versailles Treaty and to the result of the plebiscite, provoked Rathenau to a demonstrative resignation from the Cabinet.

Rathenau did not withdraw his help from the Cabinet, however, and went, deputed by the same, in Nov. and Dec. 1921 to London, to enlist England's interest and understanding, and moreover to secure a British loan for the next reparation installment due from Germany. This loan was refused, for the reason that "under prevailing conditions" decreed by the reparation commission for the German liabilities during the next year such a loan could not be granted by Britain. Whilst in England Rathenau came in touch with the then leaders of the British Government. Under his influence arose the famous Lloyd George "Project of Chequers," which for the first time gave a certain practical form to the idea of a "United States of Europe" by proposing the reconstruction of Russia through the united economic forces of the other chief nations of Europe, including Germany. The ideas underlying the later Pact of Locarno (1925) were also discussed.

In Paris, whither Rathenau went immediately after the London negotiations, he found less support. Nevertheless, the project discussed at Chequers led to the conference of Cannes (Jan. 1922), which gave Rathenau the opportunity, in an eloquent speech, to declare before the world the impossibility of the London reparation demands and to obtain an essential diminution for the reparation payment of 1922. It led also to the great economic conference of Genoa (April-June 1922) in which for the first time since the War Germany was admitted on equal terms with the other Powers.

In the meantime, at the wish of the Chancellor, Wirth, Rathenau had entered the Cabinet again, this time as Minister for Foreign Affairs. The negotiations in Genoa, opened under such great auspices, did not unfortunately produce the expected result of a united European work of reconstruction. The fundamental theme for the settlement of the question of reparation was not discussed owing to the opposition of the French Govt., led by Poincaré; Russia also would have nothing to do with the Chequers plan. But separate negotiations between British and French representatives took place with Russia to the exclusion of Germany. Rathenau, fearing that these secret negotiations would be carried out at the expense of Germany, accepted on April 16 1922 at Rapallo the Treaty of Peace and Friendship offered by the Russians, cancelling all reciprocal demands which had accrued from the War, thereby visibly proving that Germany was endeavouring on all sides to unite the threads which had been torn asunder by the catastrophe.

The climax of his endeavour to lead back the minds of the nations from their condition of blind hatred to the "way of reason" was shown by his great speech in Genoa on May 19 1922, which, after a concise summary of the hindrances to Europe's reconstruction and the necessary steps for the accomplishment of the same, ended with the soul-stirring cry of Petrarch: "Pace—Pace—Pace!" The question of the alleged war guilt of Germany was one that Rathenau had mostly at heart. He zealously furthered the publication of the pre-War documents and declared, on July 13 1922: "The way of truth is long; it is all the longer as the lack of European interest has caused the questions which to us are vital questions to be looked upon as solved and the verdict of history as pronounced. The verdict can only be pronounced by a universally acknowledged tribunal. Our search for the truth will not be satisfied till, in the name of history, a verdict has been passed by an authorised tribunal."

The effects of the inflation of the currency on the middle classes, who had made great sacrifices during the War and were now absolutely impoverished, caused him the greatest anxiety. Many relief measures for these classes were passed owing to his efforts. At the same time he fully realised that German industry, when no longer under the influence of the inflation, would have to encounter extraordinary dangers; but that the development of reparation payment in kind and the treaty with Russia

would at least ensure some work for industry in the impending hard times of recovery. Nevertheless, he considered that all attempts in this province must of necessity be frustrated until the burden of reparation was kept within reasonable bounds.

Rathenau, however, was not permitted to see the fulfilment of his plans. On his usual morning drive from his house to the Foreign Office on June 24 1922 he fell a victim to the bullets and hand-grenades of misguided young Germans, who by this deed robbed their country, not only of a great philosopher and industrialist, but of one of their most fervent patriots and of the best Foreign Minister of that time. The intransigence of Poincaré made Rathenau's politics appear too lenient to the fanaticised eyes of his youthful murderers. The anti-Semitism which is always wont to follow great upheavals contributed the rest. Numerous threats had preceded the murder; Rathenau knew too well to what dangers he was exposed during the whole of his public career as Minister, and in the proud consciousness of the integrity of his intentions he declined every attempt of the Chancellor and his friends to surround him with detectives.

The space available is insufficient to deal with Rathenau's philosophy as expressed in his writings. He was, in the philosophical sense, an idealist. Adopting the evolutionary theories of Leibnitz and Darwin, he saw the development of man's purpose in three stages—first, prehistoric man wholly guided by instinct, then historical man led by intellect and conscious purpose, and lastly the man of the future whose fulfilment will be in the kingdom of the soul. "The soul is no weapon," says Rathenau. It thus stands in contrast to the whole spiritual world of the instinct and purpose resulting from the struggle of life. In the social world, whilst believing in an aristocracy of the mind, he realised that democracy was necessary to consolidate the crumbling foundations of the society of his day. A capitalist by birth and training, without repudiating his creed he held that in countries like Germany, carrying the burden of a dense population, "Consumption, like all enormous activities, is not an individual but a communal affair"; "The equalisation of property and income is prescribed both by ethics and by economics"; "The extant sources of wealth are: monopolies in the widest sense, speculation and inheritance"; "The restriction of the right of inheritance, in conjunction with the equalisation of popular education at a higher level, will throw down the barriers which now separate the economic classes of society, and will put an end to the hereditary enslavement of the lower classes."

Rathenau's collected works (5 vol.) were published in 1925. The following were not included and appeared separately: *Die Neue Wirtschaft* (1918); *An Deutschlands Jugend* (1918); *Zeitliches* (1918); *Nach der Flut* (1919); *Der Kaiser* (1919); *Der Neue Staat* (1919) (Eng. trans. *The New Society*; *Krit. der dreifachen Revolution* (1919); *Die neue Gesellschaft* (1919); *Autonome Wirtschaft* (1919); *Was wird werden?* (1920); *Demokr. Entwicklung* (1920); *Albert Kollmann* (1921); *Reden* (1924); *Briefe* (1926). The Rathenau Stiftung (Berlin), founded after his death, collects all bibliographical material.

(F. St.)

**RATIONING.**—This is a term of military origin, indicating the apportionment to each member of a population or of an army of his due share of the available supplies. As usually understood, the process of "rationing" is associated with the distribution of commodities in a time of shortage. It aims at just and economical distribution and the prevention of improvident consumption. During the World War most countries were compelled to ration foodstuffs in the public interest.

*Nature of the Operation.*—A complete and effective system of rationing involved the control of commodities at every stage from the source of supply to the consumer. Rationing proved to be a twofold problem, positive in the securing and conserving of supplies, negative in the prevention of injustice, waste and fraud. The consumer saw only a small part of a complex and far-reaching organisation. The economic order of the operations involved is: (1) supply; (2) distribution to localities; (3) distribution to consumers or rationing. The experience of rationing schemes has led to the establishment of a fundamental rule, i.e., "that supply must precede the ration"; in other words, sup-

plies must be assured before scientific distribution can be attempted.

During the World War two distinct rationing plans were evolved, by Germany and Great Britain respectively. Other countries adopted one or other of these schemes, with more or less modification.

## I. THE CENTRAL EUROPEAN SYSTEMS

In Sept. 1914, the general commanding in Brandenburg assumed control of all cereals, and, before the end of the year, bread cards had appeared in many German cities. By the early days of 1915, all bread cereals in Germany were under official management. The method adopted to deal with supplies and distribution gives the keynote for all the Central European efforts at rationing. The control of bread was quickly followed by that of practically every article of daily consumption. The German scheme was based on the local control of consumption, and this reposed on a supply in the main nationally controlled. Distribution and control were largely conditioned by the existing machinery of local government, with its regular gradation from the Reich to the Commune. The registration system already in use rendered it easy for the local authorities to determine the incidence of demand, and the management of actual "rationing" fell naturally into their hands.

*Control of Bread Cereals.*—Taking the control of bread cereals as an example, the system may be thus described: The consumer was provided with a card, with dated and numbered sections, and the appropriate section was cancelled by the retailer or official distributor when the ration allotted by the local authority (Kommunalverband) was purchased. Card sections were only valid as dated and numbered. This was to prevent fraud and sudden fluctuations in demand. Bona-fide travellers used special cards. Supplies were allotted to Kommunalverbände on the basis of the amounts available and the number of "men" to be fed. Manual workers received slightly more than a "man's" ration, and women and children less. The Kommunalverband got its supplies either from local producers, or from the authorities of the Kreis. These again indented on the next highest authority, and, step by step, the requisitions went on till they reached the central authority of all. This was a company formed, partly of business representatives, partly of government nominees, and capitalised partly by subscription and partly by government funds. Beyond this central company, which controlled only the supplies of its own particular group of products, was the Imperial Food Bureau, with corresponding Ministries in most of the Federal states. All supplies of breadstuffs, except those allowed to the producers for their own sustenance, had to be held at the disposal of the central company, which, in the case of cereals, was the Reichsgetreidestelle.

The country's supplies were thus centralised, and the requirements of the various subordinate authorities were met in that degree which the national or local food policy made possible. Flour and all corn products were of necessity included in the scheme. This complicated machinery resulted in faulty distribution, especially as supplies became less plentiful.

The Central Empires had to rely for their food supplies almost exclusively on home production. They had, therefore, to face the problem of obtaining the articles to be distributed from the actual producers. A special ration was allowed to "self suppliers" (*Selbstversorger*), which, although small, was generally greater in amount than that allowed to other people. This was inevitably accompanied by evasion of regulations. If the self-supplier could conceal part of his output he could retain more than his official "ration," and this he usually succeeded in doing. As official rations dwindled, the practice of concealing output increased, and an extensive illicit trade (*Schleich-handel*) came into being. The activities of this trade completely upset the calculations of the German and Austrian food controllers, and by the middle of 1917 the rationing authorities themselves were obliged to have recourse to this efficient and wide spread organisation. The German plan for rationing food was beginning to break down. Till the end of the War the central European situation was one of increasing difficulty.

## II. THE BRITISH SYSTEM

The British control of foodstuffs began to take shape in 1917. This system, as finally organised, depended principally on the

fact that the bulk of supplies was seaborne. Nearly all articles, therefore, came naturally and easily under public control from the moment they entered the country. Since Britain met her problems after Germany had been compelled to deal with similar difficulties, she had the advantage of the German experience. The British authorities had first of all to find out the real incidence of demand. This was accomplished indirectly by the first measures adopted to deal temporarily with the effects of shortage in the supply of sugar, and the movement of population occasioned by the concentrated effort to produce munitions of war.

*Sugar Supplies.*—In Aug. 1914, a Royal Commission on Sugar Supplies was set up. By the end of 1916 sugar began to be in short supply. Each trader, wholesale or retail, was then given 50% of his 1915 supply, and left to share this among his customers as best he could. In June 1917, the Cabinet decided upon a rationing scheme, under which each householder was invited to register with a particular retailer, to whom supplies were issued at a given ration per head of registered customers. In order to work this first sugar rationing scheme, some 1,800 food control committees were appointed by local authorities. Their expenditure was met from national funds, and they were supervised by 15 divisional food commissioners. These commissioners were appointed by a special wartime Ministry of Food, at the head of which was the Food Controller.

*Food Committees Established.*—The 1,800 food committees were appointed in Aug. by the local authorities, and each set up its food office, appointed its executive officer and distributed to each household in its district a sugar card, showing the number of persons in the household and having a counterfoil for deposit with the retailer. Thus, the whole population was completely registered by households, in each district. In Oct. and the following months this scheme was revised, and household cards were exchanged for individual cards, which became the sole title to the sugar ration.

On Jan. 1 1918, the rationing of individuals began, and as meantime other food supplies (e.g., tea, margarine, bacon, cheese) had begun to run short, and there was no hope of a national rationing scheme being made effective for some months, local food committees had, therefore, to arrange for the consumers under their charge as they best could. Several of them, that of Birmingham notably, began to use the powers of requisition granted to them by the Ministry of Food, and to distribute supplies to retailers, with whom consumers had to be registered. General provision for such schemes was made by an Order of the Food Controller, dated Dec. 22 1917. The same difficulty arose, however, as had been experienced in Germany many months before; different action by the authorities of adjacent districts led to confusion and discontent while some foods, such as margarine or frozen meat, were entirely unsuitable for local control. In London these difficulties at once became pressing.

*Rationing in Force.*—A rationing scheme, covering meat and fats, for London and the Home Counties, came into force on Feb. 25 1918. Each individual (about 10,000,000 were involved) received two cards, one with detachable coupons for meat, and one with numbered spaces, to be marked by the retailer, for butter and margarine. Each consumer was registered with one retailer, and each retailer was supplied with the appropriate quantity of rationed articles necessary for his registered customers. By a very efficient system of control of supplies at the ports and of the local producers through Government organisations, operating with powers of requisitioning supplies at fixed prices, and (in the case of home-grown produce) by the careful demarcation of areas of surplus and deficit, it proved possible to balance quantities available against requirements, and to insure with astonishing success that the ration cards were honoured on presentation. Just before the rationing scheme for London and the Home Counties was put into force, 500,000 people stood in food queues every Saturday in London. A month afterwards the queues had practically disappeared.

Since local authorities could not wholly insure or control supply, they could not effectively ration meat. A national scheme for meat rationing was therefore introduced on April 7. The success was as great as that of the London scheme. On July 14 1918, each member of the public received a single book, with coupons for meat and bacon, fats, sugar and lard. The supply of these articles was nationally controlled; their distribution was arranged through the normal channels of trade; and an equitable and unbroken distribution was thus assured. Jam was nationally rationed in Nov. 1918, and some

food committees rationed tea and cheese locally. It never became necessary to ration bread in Great Britain. Fodder stuffs were also controlled by the Ministry of Food, and a scheme for rationing them was coming into force when the War ended. After May 3 1919, coupons were abolished; and when sugar was decontrolled, in Nov. 1920, the period of rationing was over. In Ireland, the only rationing was a control over the distribution of sugar.

The British method of rationing was this: Each household had to send in an application form to the local Food Committee, and a ration book (with a validity, first of 16 weeks, and afterwards of six months) was then issued for each individual. The ration book contained differently coloured leaves for various foods. Each leaf consisted of a counterfoil to be signed, and given to the retailer with whom the holder of the book wished to register, and coupons (to be detached by the retailer at the time of actual purchase) for each week's supply. Spare leaves were inserted, for use if other foods (such as bread) had to be rationed at short notice. Special books were provided, entitling the holders to suitable rations for young children, growing lads, soldiers and sailors on leave, vegetarians, Jews and other particular classes. The essence of the scheme lay in the fact that each customer was tied to a particular retailer, and that thereby not only was fraud prevented, but the Food Ministry was able to have accurate information both as to the total demand and as to its distribution at any time. No retailer could obtain larger supplies than those to which he was entitled on the basis of the number of persons registered with him and the ration per head. In the case of some foods the ordinary machinery of the trade was maintained and the retailer got his permitted supplies by indenting on the wholesaler, who in turn had to send copies of the retailers' indents to a primary supplier.

Supervising and controlling the whole organisation was the Ministry of Food, which had to arrange for the importation and supply of foodstuffs in sufficient quantities to meet the rations. Special measures had to be taken in the case of meat and fats. The ordinary methods of distribution in the meat trade were transformed, farmers were tied to a particular market, each producing area had to deliver prescribed quotas of cattle, and a most elaborate control was set up at every stage of supply distribution. Butchers' meat was rationed by value, not by weight. The consumer received three coupons, each entitling him to 5d. worth of uncooked meat. The price of meat was elaborately controlled. All "establishments" of a public character, such as hotels, schools, teashops, asylums, etc., were classified, and specially treated, so that effectively their inmates or customers were on the same footing as other people.

### III. CONCLUSION

*The Two Systems Contrasted.*—The two types of European rationing systems are thus contrasted. In Germany the essential idea was the administrative independence of the local authority, which, within its limits, was jealously guarded. The whole organisation of food supply had to turn upon that which lay within the competence of the local power, namely, the actual distribution of the ration. In Britain, and the countries which followed Britain, the primary thought was the assurance of supply, and its control. The ration was a consequence rather than an antecedent of the system. The difference is largely, but not wholly, to be explained by the economic effect on a nation at war of free access to the sea.

In none of the other Allied countries was food rationing as complete or as successful as in Great Britain. Both in France and Italy the system was conditioned mainly by the allocations of the inter-Allied programme committees (*see* CONTROL) and by the fact that the scheme was administered by local bureaucrats acting to a large extent independently, with the natural result of unco-ordinated control and public indifference. Among the neutral countries Holland and Sweden had the most efficient organisation, built up on German experience. Rationing in these countries was due chiefly to vicissitudes arising out of the Allied blockade, supplies being regulated by agreement with the belligerent powers.

*United States.*—In the United States sugar and wheat flour were subjected to regulation. Towards the end of 1917 the diversion of ships from the Cuban trade made it necessary to reduce the supplies to confectioners and sweet-makers; and from July 1 1918, shipments of sugar to retailers were made on the authority of certificates issued by the food administration on the basis of the number of their customers. The restrictions placed on the sale of wheat flour were at first voluntary, but compulsory regulations were issued in Jan. 1918. These were dictated solely by the necessity of maintaining export to the European Allies.

**RAVEL, MAURICE** (1875– ), French musical composer, was born at Ciboure, near St. Jean de Luz, Basses-Pyrénées, March 7 1875 and is the most distinctive voice in modern French music. More than that, he holds an assured place in that line of composers beginning with the *clavicinistes* of the 17th century, who had so powerful an influence on French instrumental music. Educated at the Paris Conservatoire, where his master in composition was Gabriel Fauré, Ravel won the second Prix de Rome for composition in 1901. But he was not awarded the "Grand Prix de Rome," and the judges were severely criticised for thus refusing to recognise his talent; the resignation of Dubois from the directorship of the Conservatoire was in fact attributed to this cause.<sup>1</sup> When Ravel's piano pieces began to be known, notably *Pavane pour une Infante Défunte* and *Jeux d'eau*, played in Paris by Ricardo Viñes in 1902, a comparison was made between him and Debussy, whose *Pelléas et Mélisande* (Opéra-Comique, 1902) was then arousing heated controversy. It was suggested that Ravel was under the influence of the older man, but calmer reflection<sup>2</sup> showed that his technical methods were not those of Debussy; and though their names were coupled as typical of an epoch, they nevertheless represent very different aspects of that epoch.

It is true that such diverse minds as Fauré, Chabrier, and Erik Satie<sup>3</sup> exercised an influence on Ravel during his formative years, but his personality showed itself from the first. This personality became more clearly defined in his subsequent works, which included the string quartet in F, the three *Schéhérazade* melodies for voice and orchestra or piano (both 1904); the *Histoires Naturelles* (1907); *Introduction and Allegro* (septet for harp, strings, flute and clarinet) and the *Rapsodie Espagnole* for orchestra (1907). For the piano he wrote *Miroirs* and *Sonatine* (1905); *Gaspard de la nuit* (3 pieces) (1909); *Ma Mère l'Oye* (suite of five pieces) (1908); and *Valses nobles et sentimentales* (1911). The last two of these are best known in England as orchestrated by the composer. The qualities of imagination and satirical humour, combined with a vivid, and at times grotesque, sense of the picturesque are all held in poise by a clearness of vision and a sense of values and effect which are Ravel's leading characteristics. However daring Ravel's harmony may appear, he is never experimental. He has an unerring sense of direction and knows where he is going, even if he sometimes seems to watch himself going there with a smile of amusement. The cynical wit of his one-act opera, *L'heure Espagnole* (Opéra-Comique, 1911) and the conscious pose of the ballet *Daphnis et Chloé* (choreography by Fokine and produced by Diagphilev, 1912), emphasise in different ways the detached attitude of Ravel towards his art. Each work is an accomplishment in which he takes delight, and he satisfies himself by mastering each *genre* in turn. As with many artists of his generation, Ravel's career was interrupted by the World War; but his subsequent works maintained, without materially adding to, his reputation. These included a sonata for violin and violoncello and a trio for piano and strings (1922); *La Valse* for orchestra (1920) and *Trigone* (violin and orchestra). Studies of Ravel's work and aims have been made by Roland Manuel in *Maurice Ravel et son oeuvre* (1914) and *L'oeuvre de Maurice Ravel* (1921), and by André Coeuroy in *La musique française moderne* (1922). (H. C. C.\*)

**RAVENSTEIN, ERNST GEORG** (1834–1913), British geographer, of German origin, was born at Frankfurt-on-Main on Dec. 30 1834, and was educated there. In 1852 he went to England, where he served in the topographical department of the War Office from 1855 to 1872. His studies led mainly in the direction of the practice and history of cartography. He com-

piled many original maps and atlases, bringing a fine critical faculty to bear upon the data where these were not of the first order of scientific accuracy, as in his series of eastern equatorial Africa, scale 1:1,000,000 (1881-3), and of British East Africa, 1:500,000 (1889). One of his earliest writings was *The Russians on the Amur* (1861), but he was concerned mainly with the history of geography, as exemplified in his *Vasco da Gama's First Voyage* (1898) and *Martin Behaim, His Life and His Globe* (1908). He was an active member of the Royal Geographical Society and of the British Association, over the geographical section of which he presided in 1890. He died at Hofheim in the Taunus, Germany, March 16 1913.

**RAWLINSON, HENRY SEYMOUR RAWLINSON, 1ST BARON** (1864-1925), British soldier, was born Feb. 20 1864, son of Maj. Gen. Sir H. Rawlinson, Bart. He joined the army in 1884 and a year later became aide-de-camp to Sir F. Roberts in India on whose staff he served intermittently for some years. He took part in the Burma operations in 1886-7 and on the Nile in 1898; he had succeeded to the baronetcy in 1891. He served throughout the South African War (1899-1902). Some months after his return to England he became commandant of the staff college and from 1910 to May 1914 commanded the 3rd Division. Gen. Rawlinson was in charge of the forces sent to assist Antwerp in 1914, and took part in the first battles of Ypres and in the Neuve Chapelle and the Loos offensives. He commanded the IV. Army during the battle of the Somme (1916) achieving important successes. At the end of 1917 he was transferred temporarily to the command of the II. Army during Gen. Plumer's absence in Italy, and in Feb. and March 1918 he acted for some weeks as British representative on the Supreme War Council. Resuming his command of the IV. Army in April, his troops on Aug. 8, in conjunction with the French, attacked the enemy near Amiens and gained a signal victory, which heralded the general advance of the Allies. After the War he was raised to the peerage as Baron Rawlinson of Trent and received a grant of £30,000. In the latter part of 1919 he was sent to North Russia to conduct the withdrawal of the Allies from Archangel and Murman, and on his return he commanded at Aldershot for a year. At the end of 1920 he went to India as commander-in-chief. He died at Delhi March 28 1925 as the result of an operation for appendicitis.

**RAW MATERIALS.**—This term, borrowed from commerce, covers a variety of objects, classified with respect to their place in trade and industry, rather than with respect to their physical character. An object that may be classed with raw materials at one time may become a finished product at another, or vice versa. Camphor and indigo were formerly classed as raw materials in the chemical industry. Since the invention of the synthetic processes for their manufacture they have come to be classed as finished products. Coal tar, formerly a finished product of the distillation process, has now come to be the raw material for a great variety of chemical manufactures.

**An International Pool.**—As modern industry developed in many countries after the middle of the 19th century, notably in the United States and Germany, France, Belgium, Italy and Japan, the principal raw materials became, as it were, an international pool, distributed automatically among the consuming nations in proportions determined by what may be described in general terms as relative power of economic attraction; this power being based on a number of factors of fluctuating value, of which the chief are: (1) facilities for assembling materials in large masses; (2) facilities for distributing the manufactured product; (3) cheapness of fuel, or other sources of power, especially hydroelectric; (4) cheapness and above all efficiency of labour; (5) abundant liquid financial resources for carrying raw material stocks and finished products on their way to the consumer.

**Old Versus New Countries.**—The predominance of England as a market for raw materials in the first three-quarters of the 19th century rested upon a relative superiority in all these factors. Gradually other nations gained upon England in one factor or another; Germany in fuel and labour, especially the highly trained labour of the chemical industries; the United States in fuel, particular kinds of labour, financial power; Italy and

Switzerland in hydroelectric power. In general, it may be said that the tendencies of the 50 years before the outbreak of the World War were in the direction of reducing the lead of the older industrial countries and sections in the power to attract raw materials. The disturbances of trade resulting from the War forced many countries to develop independent manufacturing facilities, such as the cotton industries of China and of certain South American countries, with the consequence that the claimants upon the international pool of raw materials have become more numerous and more nearly on an even footing. Under the régime of virtual freedom the trade in raw materials underwent an immense development. The demands of industry produced a great expansion in the production of raw materials, and this expansion, often outstripping demand, reacted upon industry and stimulated its development.

**Science Gives New Resources.**—In rare instances the progress of science and invention has freed industry from its dependence on the raw materials that figure in world trade. The development of aniline dyes cut severely into the trade in materials for the manufacture of vegetable dyes, and the rise in recent years of artificial silk, or rayon, has been regarded as a menace to the raw-silk industry. Scientific and industrial progress has steadily increased the number of raw materials in trade and the volume consumed. The enormous increase in the consumption of pig-iron, copper, lead, tin, zinc; the rise of rubber, petroleum and aluminium industries; the extension of the paper industry, are outstanding examples of the effect of technical progress on the demand for raw materials.

At the same time technical progress applied to the production of raw materials themselves has greatly extended the range of possible sources. Prior to the introduction of the flotation process in copper extraction, the minimum paying ore was about 3%; 1% is profitable now. Electric concentration has made available magnetic iron ores formerly regarded as too lean for working. The progress of plant-breeding is greatly extending the possibility of supplementing the limited natural production of long-staple cotton. The development of effective systems of plantation management has opened the whole tropical belt to the production of rubber, formerly confined to limited areas in the tropical forests. Moreover, chemical science progresses steadily toward a stage when an increasing number of raw materials may be produced synthetically.

**Increased Consumption.**—The growth of industry and wealth has further affected the demand for raw materials by raising the standard of consumption. To this influence must be ascribed not only such striking instances as increase in the demand for raw silk, and the finer grades of wool and cotton, but also the growth in the consumption of a long array of articles of common use. The increase in the use of soap, for example, together with advances in organic chemistry, have produced a demand for vast quantities of vegetable oils, ground nut, soya bean, cottonseed and palm oils. The increased purchasing power of the masses and the consequent demand for a more varied diet has produced a huge increase in the requirement of tin for preserving vegetables, fruits and meats. The steady increase in the consumption of aluminium wares is another example of the effect of a rising standard of mass consumption.

**Distribution of Raw Materials.**—Most of the important raw materials are distributed widely over the world. Hardly any considerable territory is entirely devoid of workable iron deposits, although the countries bordering on the Pacific are meagrely supplied as compared with those bordering on the Atlantic. Copper deposits are almost as widely distributed; the most extensive being found in the Americas. Zinc and lead are also widely distributed. Tin in workable deposits occurs far more rarely, and a few limited areas have virtually a monopoly of it. Wool, hides and skins are of universal production, but are more likely to yield a surplus for world trade where population is relatively sparse and great areas remain in pasture or forest. Wood pulp comes from regions of extensive woodlands and cheap water power. Rubber and the more important coarse fibres and some of the important vegetable oils are limited to the tropics,

**Marketing.**—It is rarely the case that rich sources of raw materials coincide with the industrial equipment and the consuming power requisite to their utilisation. They must, as a rule, seek distant markets, and therefore assume an important place in international trade. This trade is marked by serious fluctuations in both demand and supply. The production of raw materials of mineral origin is subject to shrinkage from the exhaustion of deposits and to expansion due to the discovery of new deposits. Raw materials of vegetable and animal origin are subject to serious fluctuations under seasonal influences. The demand for many of these products is peculiarly responsive to the alternations of prosperity and depression in the centres of industry and population. In prosperous times the consumption of rubber in the manufacture of motor tyres is very active. Copper is freely consumed in the replacement and extension of electric plants that would be left untouched in bad times.

**Fluctuations of Price.**—Because of the wide fluctuations in the demand and supply of raw materials, rapid price fluctuations are characteristic of the whole field. In the case of raw materials that are relatively imperishable, like the textile fibres, metals and other minerals, the fluctuations are somewhat evened out by the accumulation of stocks in plethoric times, to be gradually released to trade in times of scarcity. This involves a complicated organisation of finance for carrying the stocks and for distributing the risks of price fluctuations. The physical aspects of the problem involve grading and storage—technically complicated processes, but seldom occasioning serious issues of policy. The financial aspects are more difficult, involving as they do the question of speculation.

In general, it may be said that the carrying of raw material stocks is inherently speculative. Where the producer holds the raw material until he can dispose of it directly to the manufacturer, he carries the risk of price fluctuations himself. Where the manufacturer accumulates large stocks for future use, the risk rests on him. If speculative markets are well developed, much of the risk may be transferred from the producer of raw materials to a specially trained body of men, whose business it is to study all the possible sources of supply and form forecasts as to the future. Where such markets exist the manufacturer who makes a contract for the future delivery of goods, may safeguard himself against fluctuations in raw material prices through buying "futures;" a manufacturer who is producing for the general market may safeguard himself against a fall resulting from falling prices of material by "hedging," or selling futures for an equivalent volume of raw material.

From time to time the belief gains currency that the speculative markets are themselves responsible for price fluctuations in raw materials, and laws are passed for curbing their operations. While there are numerous instances of price manipulation through "corners," the weight of experience seems to indicate that speculative operations which do not conform with underlying conditions of demand and supply are doomed, as a rule, to disaster. It also indicates that price fluctuations are most disastrous in those materials for which there is no organised speculative market.

**The Chief Markets.**—The principal markets for dealing in raw materials are located at the financial centres that were originally most closely related to the points of assembly and primary distribution. London has long been the predominant market for an extensive list of raw materials. Alongside of the London market, independent markets are established wherever the business of handling materials becomes important. The various markets are closely interrelated. No very wide difference can long maintain itself in the prices on the London and the New York copper markets, for example. The initiative toward price changes may arise in either market; it will soon be reflected in the other. Chief influence, however, rests with the market which represents the greater aggregation of trained speculative abilities combined with financial power. For this reason a market might retain its dominant position long after the immediate cause of its establishment, the concentration in the vicinity of material stocks for consumption, has disappeared.

**International Control.**—The World War brought to the attention of the governments and the public the remarkable dependence of modern industrial countries upon the international movement of raw materials. For the tremendous consumption of war the ordinary supplies of many raw materials were inadequate. Accordingly every belligerent nation adopted measures for conserving, rationing, stimulating the production or importation of, or preventing the exportation of various raw materials. Raw materials occupied the centre of wartime economic policy (see CONTROL). After the close of hostilities there was a flood of projects for the rationing among nations of the available stocks of raw materials, and for the working out of a permanent policy of international controls. All these projects fell to the ground because of the inherent difficulties of the problem. The world's trade in raw materials returned for the most part to the system of automatic distribution under the principle of relative economic attractive power.

But the idea of controlling raw materials in the nationalistic interest did not entirely disappear. Various materials were in 1926 controlled by governments, or by private combinations under government auspices. Among them were plantation rubber, Egyptian long-staple cotton, iodine, nitrates, potash, mercury and sisal. Some 20 or 30 more materials might be controlled by one government, or by a combination of two governments. The object of control is in each case to maintain prices. While to a certain extent the maintenance of prices may be justified, any such policy of control lends itself readily to abuses, creating international friction and ill will. It is in effect a harking back to the early modern system of controlling raw materials in the supposed national interest.

While it is not to be denied that in certain cases the policy of national control of raw materials may exert a perceptible effect on prices and for a limited period of time work a certain amount of mischief, in the way of fixing exorbitant prices, there are many reasons for doubting its practicability in the long run. A nation or a combination of two or three nations may appear to control the chief sources of the supply of a raw material. But the high prices offer a tremendous stimulus to the development of new sources elsewhere. The Chilean nitrate monopoly, for example, is exposed to the remorseless progress of the technique of nitrogen fixation. The potash monopoly of the French and German producers is exposed to the progress of methods of recovering by-product potash. The plantation rubber of the East Indies is exposed to the progress of rubber-planting in tropical America and Africa. Moreover, modern science grows more and more fertile in the development of synthetic products, or substitutes that allow the replacement of a controlled material or reduce its use to a minimum. (See COAL; PETROLEUM; RUBBER, etc.)

**RAYLEIGH, JOHN WILLIAM STRUTT, 3RD BARON** (1842–1919), British physicist (see 22.933), died at Witham, Essex, June 30 1919. He was succeeded as 4th Baron by his eldest son, Robert John Strutt (b.1875), also distinguished as a physicist and the author of numerous scientific papers in the Royal Society's *Proceedings* and elsewhere.

**RAYON:** see ARTIFICIAL SILK.

**RAYS.**—Most people are aware that the sun is the great source of energy, though probably few realise the implication of this: that they all live and move and have their being in a physical sense entirely owing to the phenomenon of radiation. All things living, from man to the humble lichen, even the "life" of inanimate Nature—fire and flood, tempest and waterfall—derive their animation from the same far-distant source and owe their every movement to rays. These wonderful messengers carry into every nook and cranny of our teeming world supplies of energy, permits to continue to live, postponements from the oncoming of utter stagnation and death. Do we seek other

FIG. 1.—Diagram showing range of electromagnetic waves. 62 octaves; uniform velocity of 30,000,000,000 centimetres per second. From *Phases of Modern Science*. By permission of the Royal Society.

supplies? We kindle the log fire as the nights draw in and there leaps into life again the sunshine of by-gone summers. We delve into the earth for coal and oil to augment the parsimony of the northern climate and stumble into a civilisation of steam and gas and electricity, such as the world has not before seen. But the glow of its furnaces is again that of the sunshine when the world was young, stored by the giant tree-ferns of the carboniferous era, ages before there was such a thing as man. In the last analysis the chariots of science are still harnessed to the same steeds as those that Boadicea flung against the Roman legions. But though unharnessed as yet and in the keeping of the future as regards their application, there are now known to theoretical science the higher powers that command and equip the chariots of the suns.

*Radiation and Life.*—In the whole economy of nature there seems to be one only door through which the prodigal outpourings of energy from the sun can find their way into the world of life. It is through chlorophyll, the green colouring matter of the leaves of all plants. The ordinary processes of destructive metabolism are the same as those of combustion and may be written after the manner of a chemical equation:—

In the presence of chlorophyll illuminated by the sun's rays, this process is reversed and the energy of the light is stored up in the form of the carbohydrates—cellulose, starch, dextrin and sugar—produced in the tissues of the plant out of the carbon dioxide and moisture of the air. A forest in sunshine is storing energy at the rate of some 5,000 H.P. per sq. m., recoverable when the timber is burnt. But this is but a minute fraction compared with that which eludes the vigilance of life. The solar radiation between latitudes  $45^{\circ}$  N. and S. of the equator corresponds on the average to 1 H.P. per 4 sq. ft., or 7,000,000 H.P. per sq. m., so that a very tiny fraction of it would suffice to do all the mechanical work of the world thousands of times over. Actually, in practice, experimental solar radiation engines have been constructed developing 1 H.P. per 100 sq. ft. of heating surface.

*Rays, Old and New.*—The subject of rays divides itself naturally into the old and the new. The older known rays are all of the one type, being electromagnetic rays travelling through empty space radially outward from their source at the uniform speed of light, 185,000 m. (or  $3 \times 10^{10}$  cm.) per second. Some of the more recently discovered rays are of the same type as light, with either very much longer waves and lower frequencies—the Hertzian waves—or very much shorter waves and higher frequencies—Röntgen or X-rays, the  $\gamma$ -rays of radium and the most recent of all, which may be termed Millikan rays. Others of the newer rays—the  $\alpha$ - and  $\beta$ -rays of radioactive substances and the cathode rays and positive rays of the vacuum tube, are not waves at all but radiant particles carrying an electric charge. When the radiated particle is a negative electron, as is the case for the cathode and  $\beta$ -rays, it generates rays of the first or wave type on impact with matter, much as a stone thrown into water generates waves in the water. The relation, however, as is so often the case with electrical phenomena, is reciprocal, and electromagnetic waves will liberate electrons from (*i.e.*, “ionise”) the atoms of matter in their path, and these liberated electrons may, under suitable conditions, act as cathode rays. The  $\alpha$ -rays consist of the flight of atoms of helium, carrying two positive charges, and the only justification for calling them  $\alpha$ -rays as well as  $\alpha$  particles, both terms being in use, is that they are propagated radially from their source. The positive rays, similarly, are positively charged atoms, and like cathode rays generated inside vacuum tubes, they follow the lines of electric force in the tube. So for these there is not even this justification for calling them rays. The most consistent definition of the term “ray” would perhaps be any carrier of physical energy across empty space, but this would include a meteor and exclude a sound wave.

*Electromagnetic Radiation.*—The whole gamut of electromagnetic radiation is well set forth in the accompanying chart,

prepared by the British Empire Exhibition Committee of the Royal Society and reproduced here by their courtesy. The wave-length in centimetres, multiplied by the frequency, which is defined as the number of waves per sec., obviously gives the distance travelled in one sec., or velocity of the rays. As this is uniform for all electromagnetic waves, it follows that the wave-length is inversely proportional to the frequency, and if one is known the other is also. The wave-length, or distance measured from crest to crest of the wave, is usually expressed in terms of the Ångström unit (Å) which is  $1/100,000,000$  of a centimetre ( $10^{-8}$  cm.). The known rays range from an estimated wave-length of  $4/10,000$  of an Ångström unit and a frequency of  $10^{22}$  to wave-lengths of many miles and frequencies of the order of 10,000. By analogy with sound, the frequency may be well expressed in octaves. It is doubled in one octave, quadrupled in two, multiplied by eight in three and so on. In the chart each octave is shown of the same length from the left-hand end of excessively high frequency and very long wave-length. The numerical details are set forth in the chart so that we may concentrate on the more important characteristics and uses of this vast range of radiation.

*Light.*—All that the 18th century handed on to the 19th was the visible region of the solar spectrum from violet to red, which is about one octave out of 62 shown in the chart, which does not include the new Millikan rays at the extreme top. It would be difficult to find in science another example of a set of phenomena apparently so diverse being comprehended under essentially the same cause, the only difference being the frequency or “pitch” of the vibrations.

Immediately on either side of the visible spectrum are the invisible ultra-violet and infra-red rays. The former, called also the photographic or actinic rays, are chiefly responsible for the chemical, physiological and therapeutic actions of light, as in photography, the photochemical synthesis of carbohydrates by vegetation already dealt with, sunburn and the pigmentation of the negroid races, and the modern methods of health culture and treatment of ailments by sun-baths, arc light and mercury vapour lamps. The shorter wave-lengths ionise the air and make it a conductor of the electric current, and on this account they play a large part in meteorological phenomena such as the electrification of the atmosphere, the condensation into rain, thunderstorms and, indirectly, of the aurora. Though invisible, they produce powerful visible fluorescent effects in a variety of crystalline substances, notably the platinocyanides.

*Absorption of Ultra-violet Light in the Atmosphere.*—In passing from the red end of the spectrum into the ultra-violet, a gradual and continuous change comes over the general penetrating power of the rays, which is reversed when we get beyond the ultra-violet into the region of X-rays. The redness of sunrise and sunset, when the rays tangentially striking the earth have to pass the maximum thickness of air in their path, shows that the red rays are less absorbed than those of shorter wave-length. On ascending a mountain and leaving the atmosphere more and more beneath our feet, the light becomes richer and richer in ultra-violet rays. Above 18,000 ft., the greater part of the atmosphere has been left behind, but long before this the well-known burning action of the sun on the skin makes itself felt. It needs something of a coarser texture than a gas like air—the suspension of liquid and solid particles which constitutes smoke, fog and cloud—to stop the visible rays. But in a fog, if the sun shows at all it is usually red. A much smaller pollution of the atmosphere by smoke than is necessary to stop the visible rays suffices completely to absorb the health-giving ultra-violet, so that it becomes of vital importance to the national health, especially in northern latitudes, to deal with the smoke problem which is one of the penalties attaching to the new coal-and-oil civilisation. Sometimes, however, when there is great uniformity of size in the particles causing the fog or smoke, curious selective absorption effects occur. The writer once saw for several days together in the Rockies, during forest fires of exceptional extent even for that region and which were causing an enormous amount of smoke, a pure violet sun.

*Absorption of  $\gamma$ -Rays.*—The transparency and opacity of matter to radiations of the range dealt with in optics are highly specific properties of the substances themselves, though outside of this range in both directions these specific differences disappear. We think it natural that most gases are colourless and transparent, whilst most solids are opaque, and the power of the X-rays and  $\gamma$ -rays to pass through opaque solids seems extraordinary. The  $\gamma$ -rays of radium can still be detected after passing through 20 cm. (8 in.) of solid lead or liquid mercury, yet if the sun were made of pure radium not a detectable trace of the radiation would survive absorption at a height of 18,000 ft. above sea-level, for the absorption of the air would there be due to the equivalent of half the total atmosphere, *i.e.*, 38 cm. of mercury, and this would reduce the  $\gamma$ -rays of radium to one million-millionth ( $10^{-12}$ ) of their original value. In this region of very short wave-length the differences of transparency, so marked for substances with light, have totally disappeared and all substances absorb a homogeneous radiation of very short wave-length to the first approximation simply according to the weight of the matter in the path of the beam. In this respect ordinary light, which reaches us so abundantly from the sun through a weight of air corresponding with 76 cm. of mercury, is far more penetrating than the  $\gamma$ -rays.

*The Region Between Light and X-rays.*—As we proceed from the red to the far ultra-violet, air becomes less and less transparent until we reach a point at a wave-length of 1,700 Å., when air and other gases are ionised by the light rays just as they are by X-rays and radium rays, and air becomes so opaque to the rays that further progress in their investigation can only be pursued in a vacuum. Ordinary glass is opaque to waves shorter than 3,500 and longer than 30,000 Å., whereas quartz will transmit between 1,800 and 70,000 and fluorite between 1,000 and 95,000 Ångström units. For the investigation of the Schumann and Lyman rays, which lie between 1,700 and 500 Å., not only is a vacuum essential but also specially sensitised plates containing hardly any gelatin which is strongly opaque. The necessity for totally excluding the air beyond this range makes it exceedingly difficult to excite the spectrum, because the electric discharge will not ordinarily pass through a perfect vacuum. Under these circumstances, Millikan in 1920 succeeded in reaching 200 Å. in the spectrum of nickel by the use of very powerful short sparks, which produced also X-rays. So that the gap between light and the X-rays may be regarded as bridged (*see SPECTROSCOPY*). We are here approaching the maximum opacity of gases where the wave-length is diminishing to molecular magnitude and the frequency increasing to that of the natural periods of vibration of the electrons in the individual molecules and atoms.

The X-rays are generated by the collision of high-speed cathode rays with platinum, tungsten or other heavy metal targets in a vacuum, in the well-known X-ray tube. For these X-rays the penetrating power, not only for gases and transparent substances, but for all substances increases rapidly as the wave-length decreases, right up to the shortest wave-lengths known.

*The Reaction Between the Electrical and Optical Projections of Matter.*—For any substance to be transparent it must be an insulator. The absorption of the waves is due to their communicating their energy to the electrons in matter and if these are free from, or only loosely associated with, the atoms the substance will conduct electricity. A gold-leaf which is so excessively thin that it will transmit green light becomes quite transparent by annealing and then loses its power to conduct an electric current. Air is rendered a conductor by Schumann rays and so is opaque to them. Ebonite, a splendid electrical insulator, is practically transparent to all rays of longer wave-length than the visible, and acts as an almost perfect filter of the dark heat or infra-red rays from light. It is indeed just transparent to the extreme red, as may be tried by looking at the sun through a very thin ebonite sheet, when it will be distinctly seen as a deep red ball. The writer noticed this in testing the light-tightness of a photographic shutter, of all things in the world, the leaves of which were made of this material, and so ran to earth the cause of a suc-

cession of mysterious failures with his camera when isochromatic plates were employed! In modern thought the chemical and physical activity of light coming into evidence in photography and fluorescence are traced primarily to the ionising action of the rays and to the electrons temporarily "jerked out" of the atoms and molecules of matter by the passage among them of waves of light in tune with their natural periods.

*Dark-heat Rays.*—In the infra-red region, rock salt is by far the most transparent optical material, and the spectrum can readily be explored by photography up to 10,000 Å., using plates sensitised with dicyanin. Beyond this they must be investigated by their thermal effects, usually by some adaptation of the thermopile which converts the heat into electric energy. The very shortest Hertzian waves which can be electrically generated have a wave-length of about 2 mm. (20,000,000 Å.) but heat waves as long as 0.3 mm. have been detected in the radiation from the Welsbach gas-mantle, so that the gap here also is practically bridged. Quartz refracts these very long waves far more strongly than the others, and by the simple plan (termed "focal isolation") of passing the rays through a quartz lens furnished with a central circular disk of black paper, the long waves may be brought to a focus under conditions that leave the others divergent, the device acting as a perfect filter for this extreme heat radiation. Wood, to whom, with Rubens, this is due, made the further very interesting observation that a "dew" of mercury globules of diameter from 0.01 to 0.03 mm., condensed on a quartz surface from the vapour, though opaque to light and ordinary heat waves, will still transmit the longest waves of all.

*Wave-length and Molecular Magnitude.*—This is a good example of how the behaviour of matter to radiation is dominated largely by the condition whether or not it is "in tune" with the rays. We get the most interesting results when the order of fineness of the material structure corresponds with the wave-length. The ruby glass of the photographer owes its beautiful pure red tint to the merest trace of metallic gold, the particles of which are of such a size as to resonate with red light but to damp out and destroy other frequencies. In microscopy this consideration is again of the utmost importance, for the resolving power of lenses is properly expressed in terms of the wave-length of the light employed. To get higher resolving power than is at present possible—as an example, to reveal the still sub-microscopic world wherein it is suspected reside the bacterial agents responsible for many diseases that baffle the physician—the only possible line of further improvement of the existing methods is by working entirely by photography in the far ultra-violet region, with objectives compounded for use with these short wave-lengths. The limit of resolvability with visible light has been already reached.

*Some Applications.*—By photographing the lunar surface through screens capable of transmitting only yellow, violet and ultra-violet light respectively a sort of lunar survey by colour has been attempted. It revealed a remarkable deposit round one of the craters, Aristarchus, which in all probability is due to sulphur. Screens transmitting ultra-violet light with hardly any of the visible rays produce the most revealing effects on the human countenance, distinguishing instantly false teeth from real and skin from cosmetics by their different fluorescent power. Under radiations of short wave-lengths including the X-rays and  $\gamma$ -rays, many natural gems, such as the diamond, shine brilliantly by fluorescence, whilst imitations remain dark, and this simple test serves to distinguish the false from the true.

*The Laws of Radiation.*—The most important laws concerning radiation are those connecting the quantity and quality of radiation with the temperature of the radiator. They are strictly true only for perfect radiators or "black bodies," but are applicable under certain conditions to all bodies: for example, when they are heated in a closed furnace and their radiation examined through a small hole in the wall. Stefan's law states that the total quantity of energy radiated freely to outer space by a body is proportional to the fourth power of the absolute temperature. Wien's displacement law states that as the temperature increases, the region of maximum radiation shifts along the spectrum from

longer to shorter wave-length, the maximum energy is radiated at a wave-length which is inversely proportional to the absolute temperature, and the quantity of energy radiated at this maximum is proportional to the fifth power of the absolute temperature.

The latter law states in exact form the familiar fact that a body when treated first glows red, and that as its temperature is increased the colour changes through yellow ultimately to white. Below red heat, the maximum of energy emission occurs in the infra-red region, and the hotter the body the further is the maximum displaced towards the violet. In this way the surface temperatures of the sun and stars have been estimated. The red stars, like Betelgeuse, are comparatively cool with a temperature of about  $3,000^{\circ}\text{C.}$ , which is about that of the carbon arc, the highest attainable on the earth, whilst blue-white stars like Sirius have temperatures at least four and perhaps 10 times as great. The surface temperature of the sun is estimated at about  $6,000^{\circ}\text{C.}$ , and the maximum of energy emission at this temperature occurs at the yellow-green. It is probably by no means mere coincidence that this is also the most vivid colour, in the sense that light energy of this colour is perceived by the eye in smaller amount than that of any other. Probably the eye has adapted itself through the ages to make the most of that which there is most of in the sunlight. If so, and in the course of time the sun cools, people, if any were still alive, would see red most vividly. Our violet would have faded out and become ultra-violet, and our infra-red heat rays would have become visible as light.

*The Structure of Matter.*—To understand the mode in which electromagnetic radiation originates it is necessary to be acquainted with the modern theories of the nature of matter. Matter is regarded as intrinsically positively charged, *i.e.*, it carries a positive charge of electricity as an essential quality. In the neutral atom, this charge is exactly neutralised by a corresponding number of separate electrons or atoms of negative electricity. The atom is regarded as a miniature solar system with a positive material nucleus as the sun and the individual electrons as planets. The number of units of positive electricity on the nucleus and the number of revolving electrons both differ by unity in passing from one element of the periodic table to the next. This number is called the Atomic number, or Moseley number, after the brilliant young Oxford physicist who fell at Gallipoli shortly after his researches on the characteristic X-rays of the elements, from which this conclusion was drawn. The Atomic or Moseley number is one for hydrogen, two for helium, three for lithium and so on through the periodic table of the elements up to uranium, the last and 92nd, for which it is 92.

But these numbers really represent the net positive charge of the nucleus, the difference between its gross positive charge and a smaller number of nuclear electrons, for all atomic nuclei except hydrogen contain some electrons. The hydrogen nucleus is regarded as the pure positive sub-constituent of all matter, and is called sometimes the "proton." When for two atoms the nett charge is the same, but the gross charges (positive *minus* negative) different, we get elements identical in chemical character but of different atomic weight, called isotopes (*q.v.*). So far as wave radiation is concerned, we deal with the electrons external to the nucleus, but the  $\beta$ -rays of radioactive substances are electrons ejected from the nucleus of the atom. The external electrons are regarded as arranged in sets of "shells" at different "levels" or distances from the nucleus, whilst the odd ones over are the outermost of all and are relatively far removed from the central nucleus. They are called the valency electrons, as it is they alone that confer on the atom its chemical affinities or valencies. The others constitute with the nucleus a more self-satisfied economy, which, however, entirely controls the configuration of the outer electrons and therefore the chemical character of the atom. The most complex elements, like uranium with 88 "shell" electrons and four valency electrons, are regarded as having many shells, called as we go outward the K, L, M . . . shells, whilst the lightest element with a complete shell, helium, has only the K shell.

*The Origin of Radiation.*—Electromagnetic radiation arises whenever an electron alters its previous mode of coexistence with

matter sufficiently abruptly. Beyond the range of frequency even of the longest Hertzian waves, with wave-lengths of many miles and frequencies of the order of 10,000, we come to the frequencies of the ordinary alternating electric current of commerce, given by a dynamo, and ranging from 15 to 100 or so a second. In the conductors carrying such a current the electrons are surging back and forth at these low frequencies, but the motion is too leisurely to excite any external radiation. Besides, the wave-length for a frequency of 15 would be  $1\frac{1}{2}$  times the earth's diameter.

*Hertzian Waves.*—In the spark that occurs when a condenser or Leyden jar is discharged, or in the lightning flash, alternating currents of precisely the same kind, but with the frequency of the order of a million are set up. The frequency is completely controlled by the resistance, self-induction and capacity of the oscillating circuit. The electrons surging backward and forward through the circuit set up waves of their own period, which carry outward through space some of the energy of the electric current as Hertzian waves. In general the smaller the dimensions of the oscillating circuit, the higher the frequency and the shorter the wave-length. As we pass along the gamut, beginning with this artificially excited surging, through the aerial and antennae of a transmitting station, to the infra-red rays, we pass to the natural motions of the electrons in the molecules of matter at their own proper periods, which are excited by heat.

*Spectrum Lines.*—At first there is probably no very close connection between the vibrating electrons and the individual atoms and molecules. As in the transmission of the ordinary electric current, the electrons concerned in producing radiant heat are probably those associated loosely with aggregates of matter rather than with single atoms and molecules. But the higher frequencies result from the constituent electrons of the individual atoms of matter moving with their natural periods around the nucleus in definite orbits, each orbit giving a sharp line in the spectrum (*q.v.*) of the element. The break between ultra-violet light and the X-rays occurs at the valency electrons. Optical spectra result from the outermost electrons, and X-ray spectra from one or other of the inner completed shells.

The actual emission of radiation is depicted as due to the "falling in" of an electron towards the nucleus, after some previous disturbance has ejected it. In the series spectra in which the lines of the series are mathematically related, which line of the series is emitted depends upon which of many possible orbits the falling electron ends up at. There are for each electron a large number of possible "non-radiating" orbits in any one of which it may revolve indefinitely without radiating energy, if undisturbed, but if it falls from an outer to an inner orbit, the atomic system as a whole loses energy, which is emitted as radiation. The frequency is a function of the amount of energy so lost (*see QUANTUM THEORY*).

*Different Types of Spectra.*—Should the initial disturbance which precedes the emission of radiation eject the electron altogether from the sphere of influence of the parent atom the latter is ionised; that is, it becomes a positive ion, and the electron, if it has sufficient velocity, may come into evidence as the cathode-ray. Without going too far into the details, we may broadly regard the emission of radiation as accompanying in general the reunion of electron and positive ion. Not only one, but two, three or even four of the valency electrons may be ejected from an atom and the positive ion may be singly, doubly, trebly or quadruply charged. This gives the explanation of the fact that certain elements give different spectra according to the mode of excitation, whether by heat as in the flame or electric arc, or by electrical agencies as in the electric spark. It has been ascertained that the arc spectrum signalises the union of the electron with the singly charged, or as the chemist would say, monovalent, positive ion, to yield the neutral atom, whereas the spark spectra signify that a multiply charged or polyvalent ion has united with an electron to form a positive ion with one charge less than before.

These phenomena are the spectroscopic equivalent of the changes with which the chemist is familiar in the reactions of

salts, bases and acids, as distinct from those of organic compounds and other non-electrolytes, or non-ionised substances. Ferrous iron,  $\text{Fe}^{++}$ , resembles magnesium,  $\text{Mg}^{++}$ , in its chemistry, whereas ferric iron,  $\text{Fe}^{+++}$ , resembles aluminium,  $\text{Al}^{+++}$ , the element next to magnesium in the periodic table. So the spark spectrum of a metal, whilst totally different from the spark spectrum of the same metal, often bears a very close resemblance in its series relationships to the arc spectrum of the metal next preceding it in the periodic table. The spark spectrum of magnesium, due to the change  $\text{Mg}^{++} \rightarrow \text{Mg}^+$ , is analogous to the arc spectrum of sodium, due to the change  $\text{Na}^+ \rightarrow \text{Na}$ . Sodium, magnesium, aluminium and silicon are successive elements in the periodic table. So we find aluminium giving, in addition to the arc spectrum, two spark spectra due to the changes  $\text{Al}^{+++} \rightarrow \text{Al}^{++}$  and  $\text{Al}^{++} \rightarrow \text{Al}^+$ , the first of which is analogous to the arc spectrum of sodium and the spark spectrum of magnesium, and the second to the arc spectrum of magnesium. Similarly, silicon, in addition to its arc spectrum, possesses three spark spectra (1)  $\text{Si}^{++++} \rightarrow \text{Si}^{+++}$ , analogous to the arc spectrum of sodium, the spark spectrum of magnesium, and the second spark spectrum of aluminium, (2)  $\text{Si}^{+++} \rightarrow \text{Si}^{++}$ , analogous to the arc spectrum of magnesium and the first spark spectrum of aluminium, and (3)  $\text{Si}^{++} \rightarrow \text{Si}^+$  analogous to the arc spectrum of aluminium.

*Stellar Spectra.*—In some of the hotter stars the sparks or, as they are sometimes called, the enhanced lines, are found unaccompanied by the arc lines of the element. This is never the case for artificially generated spectra. Norman Lockyer ascribed their origin to veritable transmutations of the elements into simpler "proto-elements" due to the intensely high temperatures. We now know that they are of electrical rather than thermal origin, and are due to precisely the same changes as we are familiar with in the chemistry of elements capable of acting with more than one valency.

*X-ray Spectra.*—In the X-ray spectra the inner shells of electrons are concerned, and although these correspond with changes of a deeper character than chemical—the material counterpart of which remains unknown—yet even these are not transmutational. These spectra are characterised by relatively great simplicity. A beam of X-rays is diffracted by a crystal. The regular spacing of the atoms in the crystal is of the same order of magnitude as the wave-length of the X-rays and several thousand times finer than the finest diffraction gratings ruled by the dividing engine, which are used to produce optical spectra. The production of X-rays is, like that of Hertzian waves, an artificial rather than a natural process. The electron ejected from the cathode of a vacuum tube under high electric potentials acquires great speed and becomes the cathode-ray (the radiant matter of Sir W. Crookes). If speedy enough, it can penetrate into the deeper electronic orbits and ionise the atoms in its path. If it disturbs the deepest level of all, an X-ray of the K series is generated. These are of the highest frequency and shortest wave-length, and consist for each element of a pair of doublets, one strong and one weak, which alter their frequency with the utmost regularity in passing from element to element in the periodic table (Moseley's law). So that the wave-length may be calculated for any element even if the element is not known, and in this way several new elements, notably hafnium, have recently been discovered. What has happened is that we are now so near the nucleus that its + charge, altering integrally from element to element, alone controls the periodicity of the K electrons. The outer L, M, N levels neutralise one another's effects, much for the same reason as that there is no effect of an external charge inside a hollow closed conductor. The L, M, N series of X-ray spectra are not so simple as the K series, but they are still simplicity itself compared with optical spectra. They are excited by electrons of far less velocity than the K series and require for their generation only moderate voltages.

But it is impossible to generate artificially the K series of the heaviest elements, *i.e.*, to impress on the electron sufficient energy to carry it beyond the L level. Fortunately, here nature comes to our aid. The penetrating  $\gamma$ -rays of the radioactive substances are the K series of the heaviest elements.

As we pass outward from the K to the N series, the X-rays become of increasing wave-length and decreasing frequency and penetrating power, until progress can only be further made by working in a complete vacuum as for the shortest ultra-violet rays owing to the absorption of the air.

*The Rays of Radioactive Substances.*—In the other direction, when we pass the K level and enter the "holy of holies" of the atom—the atomic nucleus—we come to the region of radioactive phenomena. From the artificial Hertz waves to natural heat and light rays we passed on to the artificial X-rays, but now we are back again to a natural process—with a recently discovered one—confined to the last and most complex elements of the periodic table. So far it has proved itself one which our utmost electrical potentials are quite unable to imitate or affect in the slightest degree. Radioactivity is essentially a nuclear explosion, in which either a  $\beta$  or an  $\alpha$  particle is violently expelled, the former at speeds ranging nearly up to that of light and the latter at speeds between  $1/14$ th and  $1/20$ th of light. As the  $\beta$  particle rushes outwards from the nucleus it may play havoc even with the K economy, which in the most complex elements is too deep to be disturbed by any available artificial agency. The most penetrating  $\gamma$ -rays are emitted as these K electrons resume their orbits, but there are also other and less penetrating types of  $\gamma$ -rays emitted, corresponding with the L and possibly other orbits.

*Medical Uses.*—On account of their unique penetrating power and powerful "burning" therapeutic action, the X-rays and  $\gamma$ -rays are employed—quite apart from the well-known application of the former to surgical diagnosis—as medical agents especially in the treatment of deep-seated cancers. It appears that young and developing cells especially are most sensitive to and easily destroyed by these agents and this explains their use in this field and also their alleged action in producing sterility both in the male and female. In America, especially, the technique of radium therapy has been ingeniously developed as an accessory in the surgical treatment of cancer. The radium emanation, which is the first gaseous product of the disintegration of radium—the  $\gamma$ -rays being emitted in the fourth change—is sealed up in capillary glass—or more recently gold—tubes, capable of being inserted by a surgical needle into the growing periphery of the cancer, after the excision of the main growth. The tubes, hardly thicker than a hair, are left in place. The radium emanation decays in the course of a few days, whilst the original radium from which it was derived generates a fresh crop for use again. This treatment has its legitimate niche in therapeutics, but it has been grossly exploited to augment the market price of radium.

The most penetrating X-rays it is possible to produce by the most powerful appliances are only one-twentieth as penetrating as the most penetrating  $\gamma$ -rays, being quite undetachable after passage through 1 cm. ( $\frac{1}{2}$ ths of an inch) of lead and for all practical purposes completely absorbed by 4 millimetres. They belong to the L series of tungsten, platinum or iridium, according to the metal used for the anticathode of the X-ray bulb. On the other hand, in regard to intensity or quantity of energy, the  $\gamma$ -rays cannot be compared with the X-rays. The output of power from an ordinary X-ray tube is vastly greater than from any quantity of radium normally obtainable. As in so many other cases, the problem in the use of these agents in medicine is to adjust their strength to the correct quantity to inflict the greatest damage on diseased tissue with the least to the healthy tissue.

*The  $\alpha$ -rays.*—The  $\alpha$ -rays of radioactive substances, our knowledge of which is mainly due to the long and brilliant series of researches upon them by Sir Ernest Rutherford, can only be mentioned incidentally as they are sufficiently important to deserve separate treatment. Though possessing by far the greater part of the total energy radiated by the radioactive substances they are of relatively slight penetration, being stopped by a few centimetres of air. Indeed it is a new and most significant phenomenon to find atoms of matter capable of passing through matter at all. But, like the other rays, they are stopped by matter irrespective of its chemical or optical nature, and mainly according to the weight in the path of the beam. They are exceptional in that

they have a very definite range, depending only on their velocity, which causes them to continue in unchanged numbers during absorption and suddenly to stop all together. This is well seen in the microscopic halos, called pleochroic halos, sometimes encountered in clear mica. The  $\alpha$ -rays have the power of darkening mica, and these halos surround infinitesimal specks of radioactive materials in the mica. Under the microscope they are seen to be perfectly spherical, of diameter 0.03 mm. in the case of the uranium halos and 0.04 mm. for those due to thorium, and they often possess a clear structure consisting of a number of concentric rings, the diameters of which correspond to the ranges of the various  $\alpha$ -rays involved. The mica has, through the ages, integrated and recorded in minute detail the properties of the  $\alpha$ -rays from quantities of material too infinitesimal to be detected even by the most delicate direct radioactive tests.

Similarly, the  $\alpha$ -rays possess a definite though minute range of penetration in glass, very similar to that in mica, and capillary glass tubes can be drawn so excessively thin in the wall as to allow the  $\alpha$  particles to go through. Such tubes are completely impervious to ordinary gases, but if filled with radium emanation which emits  $\alpha$ -rays helium is produced outside the tube in quantity sufficient to be detected by the spectroscope. This constituted the final step in the long chain of proof that the  $\alpha$ -rays are radiant helium nuclei, i.e., helium atoms shorn of their 2 K electrons, and each carrying therefore two positive charges.

*The Exploration of the Atom by  $\alpha$ -Rays.*—The central nucleus of the atom was originally put into evidence by a careful examination of the trajectories of the  $\alpha$  particles during their passage through matter. Like errant suns invading other solar systems, it is only rarely that they make a full head-on collision with the centre of the atomic solar system invaded. They scatter the electrons in their way almost as though they were not there, but a minute proportion of the impinging  $\alpha$  particles are turned abruptly out of their paths and may even be returned the way they came. These are the ones which have passed sufficiently near to the central nucleus of the atom collided with, to be sensibly deflected from their headlong path. In some cases it has been established that the nucleus struck by the  $\alpha$  particle suffers actual disruption, a hydrogen nucleus being detached from it and going off as a separate "H-particle," having similar properties to the original particle. This constitutes a secondary transmutation consequent on the natural one of the radioactive substance itself.

*Artificial Transmutation.*—To drive the positively charged helium nucleus up against the very highly positive charged nucleus of a heavy atom demands great energy, whereas a negatively charged  $\beta$  particle or cathode ray, provided it has sufficient energy to overcome the repulsion of the cloud of electrons surrounding the nucleus of an atom, will, once it has got through them, tend to rush into the nucleus. If it stayed there, the atom struck would itself be transmuted into an atom of the element preceding it in the periodic table; for example, lead into thallium, thallium into mercury or mercury into gold. In the radioactive change in which a  $\beta$  particle is expelled from the nucleus we have the exact converse. The atom from which the  $\beta$  particle is ejected constitutes an atom of the element succeeding the original in the periodic table. Its atomic number has been increased by one by the loss of a negative charge, and therefore the element moves up one place in the periodic system. In the  $\alpha$ -ray change, in which the atomic nucleus loses two positive charges, the element moves down two places. For example, from uranium we get an isotope of thorium, and from thorium an isotope of radium.

Altogether apart from theory, Miethe of Charlottenburg has recently claimed to have effected an infinitesimal transmutation of mercury into gold, by its use in the mercury vapour lamp and in the turbine interrupters employed with X-ray coils. Since then (1926) Smits and Karsen of Amsterdam, using a lamp with molten lead instead of mercury, have obtained the clearest spectroscopic evidence of the production of mercury, and to a lesser extent thallium, in the process. These results, if established by further experiments, constitute the first clear achievement of an artificial transmutation process. They are quite in keeping with modern ideas of atomic structure, always on the assumption

that the actual proportion of element so transmuted is excessively minute. It is only the infinitesimal proportion of the impinging rays accurately aligned upon the minute central nucleus that can be effective. In Rutherford's experiments with the  $\alpha$  particle, it was estimated that only 10 in a million million of the collisions in the most favourable cases effected the disruption of the nucleus.

*Millikan Rays.*—It has been known since 1903 that the atmosphere was traversed by very penetrating rays similar to those given by radium but extremely feeble in intensity, and it was natural to attribute these to the small amount of radium, ( $g.v.$ ) billionths of the whole, known to be present in rocks and other materials of the earth's crust. No doubt part of the effect is due to this cause. But in 1912-4 Gockel and other German physicists, investigating this penetrating radiation in the atmosphere from balloons, made the remarkable discovery that it increased on ascending, slowly at first but rapidly above 10,000 feet. Millikan, in the United States, sent up recording instruments in balloons to the height of 10 m. and, though he confirmed the increase, found that it was much too small to be explained by ordinary  $\gamma$ -rays reaching the earth from outer space. He then sunk his instruments in the deep lakes fed with pure glacier water found at high altitudes in the Rockies and (1925) completely established the existence of an entirely new radiation reaching the earth from the outside, capable of penetrating 68 ft. of water, or over 6 ft. of lead, before being completely absorbed. The whole thickness of the atmosphere, though it would much enfeeble a radiation of this penetrating power, would not completely stop it. The intensity of this new cosmical radiation is not affected by day or night, so that it does not come from the sun, and most of the ordinary  $\gamma$ -like radiation of the atmosphere appears to be a secondary result of this new radiation being scattered and transformed in passing through the air. The new rays are about as much more penetrating than the most penetrating radium  $\gamma$ -rays as the latter are with reference to the most penetrating X-rays, and their wave-length is estimated at 0.0004 Ångström unit. By their discovery some  $4\frac{1}{2}$  octaves are added to the extreme top of those shown in the chart.

*The Origin of Radiant Energy.*—Their existence gives weight to some very far-reaching cosmogonical speculations to account for the primary source of cosmical energy which have recently been put forward by Jeans. The quantity of energy that the sun and stars appear to be perennially pouring out is so great that no known process, not even radioactivity, can account for it. It must, however, be remembered that there is no actual proof that radiation is really propagated uniformly in all directions. Of recent years there has been a tendency to believe that this may be an illusion due to our being completely surrounded by matter, the air above and the earth beneath. An alternative view that has been gaining ground during the present century is that radiation can only travel along lines or tubes joining separated portions of matter. If this, just possible, point of view should prevail there would then be no great difficulty in accounting for cosmical energy. If the sun only radiated to the earth and other worlds surrounding it, the emission of energy would be only a tiny fraction of what it must be if it is radiating to an equal extent in all directions of space.

However that may be, Jeans has supposed that the primary source of cosmical energy is a veritable annihilation of matter. The doctrine of relativity points to an equivalence between energy and matter, and blends the twin laws of conservation into one. Matter is conserved when energy is, and energy is conserved when matter is, but the real relation is that the sum of matter and energy is conserved, though matter may be transformed into energy and energy into matter at a definite exchange ratio. According to this theory, the annihilation of matter would result in the appearance of energy equal to that possessed by twice the mass annihilated moving with the speed of light. Thus from a very minute amount of matter an almost incredible amount of energy would be generated.

In all the processes we have considered, proton and electron maintain their separate identities, though powerfully attracting one another, by actions identical in type with those which keep

apart satellites from planets and planets from suns in cosmical systems. Whereas if proton and electron fell into one another so that their opposite charges neutralised each other, there would in all probability be nothing but the energy of the system left, and this, from analogy with the known cases of electromagnetic radiation, would be radiated outward, at a very high frequency corresponding with the colossal quantity of energy involved. The estimated wave-length and frequency of the Millikan rays is just about of the order to be expected from the actual falling in of an electron into a proton, and for the total annihilation of the mass by transformation into radiant energy. This gives this otherwise extremely speculative and bold theory greater importance. Such a process would satisfy the demands of the cosmogonist for energy over almost infinite periods of time. It may be taking place in some stages of the evolution of stars. That it cannot be a complete explanation in itself seems to be indicated by the fact that our sun at least does not appear to be emitting these new radiations. So science is advancing into ever wider horizons and the 20th century bids fair to hand over to its successor realms as vastly greater than it received as were the realms the 19th handed on to us.

**REA, SAMUEL** (1855– ) American railway official, was born at Hollidaysburg, Pa., Sept 21 1855. In 1871 he worked for the Pennsylvania Railway as chain and rod man. From 1875 to 1877 he was assistant engineer on construction of the Monongahela river bridge at Pittsburgh. He was next appointed assistant construction engineer for the Pittsburgh and Lake Erie, returning to the Pennsylvania lines in 1879. In 1889 he joined the Baltimore and Ohio, being chief engineer for construction of the belt-line tunnel under Baltimore. In 1892 he was appointed an assistant to the president of the Pennsylvania railway, rising through the various grades to first vice-president in 1911. In 1913 he was elected president. He was in charge of the construction of the Pennsylvania station in New York City (completed in 1911), the connecting tunnel under the Hudson river, the New York connecting railway, and Hell Gate bridge over the East river (opened in 1917). In 1917 he became a member of the special commission on national defence of the Railroads War Board. He was director of the department of railroads, electric railways, highways and waterways of the committee of public safety of Pennsylvania. In 1918, when the railways were taken over by the Government as a War measure, he was replaced as operating head of his road, but remained in charge of its corporate affairs. He retired from the presidency of the railway Sept. 1925. He was the author of *The Railways Terminating in London* (1888).

**READING, RUFUS DANIEL ISAACS, 1ST MARQUESS OF** (1860– ), British statesman, was born in London Oct. 10 1860, the second son of Joseph Isaacs, merchant of the city of London. He was educated at University College School, London, and abroad. This education was truncated by his adventurous spirit, which caused him to run away to sea at the age of 14 and to serve for two years before the mast in a sailing ship; and it was as ship's boy scrubbing the deck that he first saw India where he afterwards ruled as Viceroy. He entered subsequently the commercial world on the Stock Exchange, but here also his adventurous spirit resulted in complete failure. Undaunted by these early disasters he proceeded to read for the Bar, was called in 1887 and became a bencher of the Middle Temple in 1904. In 1887 he married Miss Alice Cohen. His legal career was one of unbroken and immediate success, through indefatigable

capacity for work, great personal popularity and a method of advocacy which relied on quickness and subtlety of intellect and enormous tenacity of memory. Perhaps the most sensational of his cases was the prosecution of Whittaker Wright for fraud, which was followed by the defendant's suicide, after a conviction obtained despite the published and declared opinion of the law officers of the Crown that no prosecution had any chance of success. He rose by a succession of triumphs to the position of the most distinguished advocate and verdict getter of his generation.

He entered Parliament as a Liberal Imperialist, winning a seat for his party at Reading in a bye election in 1904, a seat which he retained in numerous successive elections until he was transferred to the House of Lords. In political oratory, although an effective speaker in the country, he failed, as so many great lawyers have failed, to impress the House of Commons; being far more inclined to address his opponents as a jury with a view to their conversion than to stimulate enthusiasm for the policy of his own party. From the beginning, however, his extraordinary power of sane judgment was recognised, even before his appointment as attorney general in 1910; and the high regard entertained for him by the leaders of the Liberal party was openly recognised, in defiance of all precedents, by the giving to him of a seat in the Cabinet in June 1912, while he held that office.

His career of unbroken success was clouded for a time by a fierce and bitter attack upon him for having purchased from his brother some shares in the American Marconi Company at a time when the British Marconi Company was making a contract with the British Government; and as he had sold a few of these shares to the Chancellor of the Exchequer, Mr. Lloyd George, he had to bear the brunt of an onslaught concerning a transaction in which he had been merely careless, stimulated in the main by anti-Semitic prejudice and by partisan efforts to destroy the reputation of Mr. Lloyd George. After nearly a year, however, of heated deliberations by a committee of the House of Commons and violent attack and abuse, his honour was decisively vindicated by the verdict of the committee which was endorsed by Parliament, and a few months later (Oct. 20 1913) he was raised to the position of Lord Chief Justice of England, and a short time afterwards was created Baron Reading of Erleigh. As attorney general he only once personally undertook prosecution for murder (in the Seddon poisoning case) and although he obtained a verdict with his usual ability in this historic criminal trial, he consistently refused to undertake such work again.

He distinguished himself mainly in his high judicial office by humanity in the conduct of criminal cases, and by the deliberate establishment of the principle that the court of criminal appeal should act as a real court of revision, upsetting verdicts or reducing sentences even of the individual High Court judges. The most historical of the trials over which he presided occurred during the World War. This was his trial of Sir Roger Casement for treason in connection with the Irish Rebellion, in which he exhibited, with the granting of every kind of opportunity to the advocates of the prisoner in a political trial, an historical example of the dignity and impartiality of British Justice in face of an outburst of national feeling.

After the outbreak of the War in Aug. 1914 the Government utilised his soundness of judgment and knowledge of finance in matters altogether apart from the high court of justice. He assisted the bankers in the drafting and the administration of those measures which saved England from financial and in consequence economic ruin. The most sensational of these was the granting of the British guarantee to the great accepting houses, to bills amounting to many hundred millions of pounds, without which neither food nor munitions could have been moved from their foreign places of origin to this country. This bold and daring measure not only saved Britain from starvation riots and the great firms of the city of London from bankruptcy, it also resulted in the end in the Government losing nothing by the transaction.

In the next two years, Lord Reading was occupied in the inner councils of the Government, especially on all questions connected with finance, and in endeavours to reconcile the growing friction between various parties in the Cabinet and between the Cabinet and the great newspapers outside. In 1915 he was President of the Anglo-French Loan Commission to the United States, where he won universal popularity and succeeded in accomplishing the most difficult of all tasks, the flotation of a great War Loan in America, which was at that time less sympathetic to the Allies than at any other time during the War. On June 26 1916 he was created Viscount Reading of Erleigh. His efforts at conciliation and sympathetic action failed, however, to prevent the breaking up of the Coalition Government of 1916. But the newly-formed administration under Mr. Lloyd George was not so foolish as to leave unutilised his extraordinary capacity for sound judgment, placating opposition and manipulating the minds of men towards decisions vital to the welfare of his country.

In 1917 he was appointed high commissioner and special envoy to the United States, perhaps the most important position for winning success in the World War, and in Dec. of that year was created an earl. In 1918 he was appointed high commissioner and Special Ambassador at Washington. It would be difficult to overestimate the services rendered on so critical an occasion by that capacity of judgment which distinguished his whole public career, combined with serenity of temper, impersonal devotion to the public welfare, and a charm which created innumerable friendships and persuaded men to modify their preconceived notions and to endeavour to fall in with his desires. It was obvious that these qualities were exactly those demanded on the War's conclusion, in the troubled and unhealthy state of India, which had been created partly by prolonged development of resentment against the absolute dictatorship of British rule, and partly by the reverberations of the War. In a condition which was highly disturbed, the appointment of the Earl of Reading to the office of viceroy and governor general of India was acclaimed by men of all parties as an appointment of the man most qualified of all living statesmen to reduce the chaos and discontent to some method of loyalty, order and peace.

Lord Reading's term as viceroy and governor general of India marked an epoch in the history of that Imperial Continent. He was faced immediately by four almost insoluble problems. First the Diarchy system of the Montagu-Chelmsford Govt. of India Act devised as a step in advance towards complete self-government, was definitely rejected by the leaders of the United Hindu and Mahomedan educated population, who in the movement known as Swaraj had resolved to make it unworkable. The second was the influence of Mahatma Gandhi, one of the most remarkable men of all time, who had inflamed millions of Indians to a boycott of the West by the East and a kind of gigantic movement of passive resistance, in which both English products and English Govt. were to be alike rejected. The third was that the national temper of India had been aroused by prohibitions and indignities put upon Indians in other parts of the Empire. The fourth, the ghastly story of the Punjab rebellion and the slaughter at Amritsar in 1919, with the support of General Dyer's action there by the governing classes in England had excited a feeling of such fierce resentment throughout the length and breadth of the peninsula as might well have caused a general uprising. Formerly, as the new viceroy said to a friend, the disaffection was confined to the articulate classes. Amritsar spread it among the villagers and peasants. One may add to this, the general impoverishment created by the vast war expenditure and by the enormous fluctuations in currency reflected in India from similar changes in the world of international affairs.

Lord Reading set himself, with patience, flexibility and loyalty to India which he had been called upon to represent, to endeavour to alleviate these sources of discontent. In dealing with the revolt against the diarchy, he found himself compelled to imprison the two Mahomedan leaders, the brothers Ali. And although he was able before the end to establish some kind

of self-government in most of the local provinces and even something like friendly co-operation in the Central Legislative Council the Constitution broke down in the Central Provinces and had to be suspended in Bengal, with a return to complete autocratic government. In the case of the boycott of the West and of Western Govt., the viceroy after several attempts at reconciliation with Gandhi—attempts that were condemned by some Anglo-Indian opinion—found himself compelled to authorise his prosecution for inciting to mass civil disobedience which resulted in a sentence of six years' imprisonment, although the Mahatma was released on the grounds of ill health after two years.

In the matter of the treatment of Indian immigrants in other parts of the Empire, Lord Reading showed himself as determined in assertion of the rights of India as could any elected native prime minister; challenging both the home government and the government of the Dominions in the rights of Indians as in the ancient days of the rights of "citizens of Rome." In the case of Amritsar and the memories of the rebellion he could only exhibit his sympathy with the Indian population and work for the healing influences of time. His difficulties were further increased by a problem altogether outside India, the struggle between Turkey and the Christian populations which was interpreted as an attempt to annihilate the Mahomedan religion. His messages on this subject to the Secretary for India, published without authorisation by Mr. Montagu, produced the dismissal of the latter; but probably assisted the Viceroy in his exhibition of sympathy with the people whom he represented.

In the struggle for financial stability he was compelled to exercise the power of certification by the viceroy against the Assembly of the much-hated salt tax. But he saw, and acquiesced in, India, like many other of the Dominions, converting itself from a free trade into a protectionist country, a change produced partly by a passionate nationalism which rejected the excise cotton duties, and partly by the need for compensating revenue by a big import duty on iron and steel. The happy result of a stabilised budget was the raising of a new loan for national development of railways and canals, the voluntary acceptance by the Indian representatives in the Legislative Council of the prohibition of the export of opium in conformity with the desire of the League of Nations, the substantial reduction of the military expenditure, combined with the establishment, if on the smallest scale, of an Indian navy, designed as a step forward in the realisation of the Indian demand to be treated as one of the great Dominions and not as a subject race. That he could exercise sternness when required as well as sympathy was shown by his action towards the Maharajah of Indore, who was compelled to abdicate as an alternative to trial by his peers for the murder of an Indian merchant who had protected a dancing girl who had escaped from his harem.

While it would be idle to assert that Lord Reading's rule had solved all the difficulties of the almost insoluble problem of India's future, no one can deny that that rule will stand in history as the great advance in conciliation, largely created by the personal popularity of himself and his wife and by his ability to convince the leaders of Indian educated opinion that his sole desire was to promote the welfare and fulfil the legitimate aspirations of a proud, self-conscious, if bewildered people. On relinquishing his office on Thursday March 26 1926, he addressed both houses of the legislature at Delhi in a speech which was received with an ovation. "The differences which have occurred" he then asserted, "have arisen from honest divergencies of opinion. There has been no difference in purpose; we have striven to attain the same end—the prosperity and happiness of India." He emphasised the whole object of his actions, not merely economic prosperity, but advance to new status and dignity, to enable India steadily to build up her own responsible institutions within the commonwealth of nations forming the empire. He could assert with truth that since the years of his accession to office there has been a great change in the atmosphere: "Peace reigns on our borders; internal disturbances have been set at rest; law and order have been vindicated and

established; the financial situation has been stabilised, with beneficent reactions on the nation-building activities of the reformed constitution. Conditions have been created which give a fair prospect to the development of India's resources, and the anxieties of the Indian moslem population have been allayed." This is no bombastic summary of a wholehearted intelligent and devoted work with a predominant sense of responsibility towards the people whom Lord Reading was called upon to rule, and it is probable that the modest catalogue of achievements, for which he was prepared to give all the credit to others, will come to be the verdict of time and credited to his own great labours. Upon his return to England in April, it was announced that Lord Reading had been raised to the rank of Marquess. (See INDIA.) (C. F. G. M.)

**READING, England** (see 22.939), had a population of 92,278 in 1921. Since 1911 parts of Theale, Tilehurst and Caversham have been included in the borough, which has now an area of 9,105 acres. A new parish, that of St. Luke's, was created on the Redlands estate in 1912, and a church, St. Andrew's, built at Caversham in 1911. Among new buildings are the Shire Hall, in Forbury, and the post-office. A new bridge over the Thames to Caversham was opened in 1923, and the old one close by closed for rebuilding in 1925. It will have two arches of unequal span, the centre-pier resting on an island in the river, where the remains of an ancient bridge and a 14th century chapel have been found.

**READING, Penn., U.S.A.** (see 22.940), annexed several tracts between 1910 and 1920, increasing its area from 3,975 to 6,090 acres. The population increased 12.2%, to 107,784; and to 112,707 in 1925 according to the census bureau estimate. Reading kept its place as the third industrial city of the State, and as an important distributing centre for anthracite shipments and agricultural produce. Trolley and bus lines were developed in every direction, and daily motor-truck service was established to New York, Philadelphia and other points. Schuylkill Canal, after nearly a century of service, was abandoned.

Reading is the centre of Pennsylvania's first super-power system, which furnishes electric current from Harrisburg to New Jersey. The value of factory products within the city limits was \$51,135,000 in 1909; \$141,561,000 in 1919; \$134,501,690 in 1923, when there were 395 establishments, several of them the largest of their kind in the world. Among the leading manufactures (1925) were hosiery, silk underwear, narrow fabrics, wrought-iron pipe, goggles, hats, children's shoes, candy, builders' hardware and machinery. By 1925 the public school system had been enlarged and diversified; extensive improvements had been made in the sewage systems; the water supply had been doubled and improved by municipal control of the watersheds, and a bond issue had been approved by the voters (1920) for the construction of additional impounding reservoirs. The construction of a new city hall and a new court house were authorised in 1925.

**READING, UNIVERSITY OF.**—On March 17 1926 a charter of incorporation was conferred on the university. Accommodation for 400 students is provided in the halls of residence, to which a sanatorium is attached. The faculties are letters, science, agriculture and horticulture in association with the National Institute for Research in Dairying and the British Dairy Institute. The progress of this institution since 1902, when it became the University College of Reading, has been uninterrupted in every respect. It has a capital endowment of £250,000 and in 1924 received £20,000 for endowing the library. In 1924 an exchange of professors was arranged with Bristol University and members of the professional staff attended the World's Dairy Congress at Washington and Philadelphia.

**REALITY:** see LOGIC.

**RECALL.**—The recall is a method whereby public officials may be removed from office by popular vote prior to the normal end of their term.

*In European States.*—An early instance is afforded by the *Abberufung*, an institution of considerable antiquity, which still survives in the constitutional texts of several Swiss cantons, although there is no record of its use during the present genera-

tion. The *Abberufung* provided that upon petition signed by a certain percentage of voters a popular vote should be taken upon the continuance in office of the legislature as a whole. If a majority of the voters showed themselves hostile to the sitting House it was dissolved and elections were held for a new legislature. Curiously enough, although the *Abberufung* is moribund in Switzerland, an institution closely similar to it has been written into the new constitutions, dating from 1919 and 1920, of the greater states of the German Reich—Prussia, Bavaria, Württemberg and Baden. Also the new constitution of Estonia (1920) provides that the legislature shall be dissolved in case it is defeated by the people on an initiative or referendum vote.

*In the United States.*—It is in the United States, however, that the recall has found the widest favour recently. Unlike the initiative and referendum (*q.v.*) this development was inaugurated in ignorance of Swiss models. Also unlike the latter the recall, as invented anew in America, is designed for attack upon a single official, although some of the laws on the subject permit it to be directed against a number of officials at the same time. Introduced first in the municipal charter of Los Angeles (1903), this feature has been copied widely by city governments operating under the commission or commission-manager plans, of which there are now some 400 in all parts of the United States. By constitutional amendment in 1908, Oregon made the recall applicable to elective state officials as well as to elective officials in counties, cities and other local government units. Between 1908 and 1920, 10 other States adopted the state-wide recall, among them California, Colorado, Kansas and Louisiana. With the single exception of Michigan all the recall States lie west of the Mississippi.

Constitutional and charter provisions on the subject usually exempt officials from recall during the earlier part of their terms—as a rule for the first six months of a term of two years or longer. To be effective petitions for recall must be signed by a certain percentage of the voters of the district or State, such requirements ranging from 10 to 55%, the most common being 25%. Within from 20 to 90 days following the filing of an adequate petition a special election is held, at which, in most cases, the elector is asked to vote, first, on the question of the recall of the official under fire; and, second, on the choice of a possible successor from among the candidates presenting themselves for that purpose.

The greatest controversy over the recall in the United States turned upon its use against judges. Opponents held that such use would destroy the independence of the courts. On the other hand it was asserted that judicial officials, like all others, might become too subservient to political machines or to corporate influence, and that occasional reminders of their dependence upon the people would be a serviceable corrective. That the opposition was effective in part appears from the fact that of the 11 States having the state-wide recall, four (Idaho, Michigan, Washington and Louisiana) expressly exempt judicial officials. In connection with the recall of judges may be mentioned the proposal for the recall of judicial decisions, which attracted a large share of attention during the presidential campaign of 1912, being advocated in the Roosevelt Progressive platform of that year. It was destined to be stillborn, however. One State only, Colorado, attempted to adopt the recall of judicial decisions (1913), but no employment was made of the device, and in 1921 the state Supreme Court of the United States declared it unconstitutional.

Unlike the initiative and referendum which have been employed actively and generally, the recall has been used in sporadic cases only, chiefly against local officials such as mayors, police magistrates and county judges. No higher state judicial officials have been removed by it, and no state-wide officials of other kinds with the single exception of the North Dakota case of 1920, when a governor and two other administrative officers were removed. The recall is no longer regarded as a dangerously radical innovation; indeed it is considered rather ineffective as a cautionary measure against "the never-ending audacity of elected persons." One positive beneficial result may be ascribed to the recall. It has reduced appreciably popular antipathy against centralising the powers and lengthening the terms of elective officials, without which necessary reforms in this direction, particularly the movement for commission and commission-manager government for cities, could not have made such great progress. (R. C. B.)

J. D. Barnett, in *The Operation of the Initiative, Referendum and Recall in Oregon* contains an excellent detailed study of the operation of the recall in that state. (See also INITIATIVE; REFERENDUM.)

**RECIFE** (*see* 22.953), is sometimes known by the name of the State, Pernambuco. The population in 1925 was 356,000, an increase of 126,000 in 15 years. Federal, State and municipal Govts. by co-operation with the Rockefeller Foundation (1919), the erection of modern hospitals, a new water system (1917) and the extension of sanitation have improved health conditions. The death-rate has been reduced to about 34 per 1,000. Yellow fever and smallpox have been practically eradicated. Paving of old and narrow streets has advanced and in the newer parts of Recife wide modern avenues are extending. Among new public buildings are fine municipal and State offices, a law college, a commercial museum, schools and theatres. New business buildings and private homes add to the city's attractiveness. Electric light and street car services have extended further into the suburbs. Good roads are multiplying and the use of motor cars is growing. Textile (one silk) mills, shoe, oil, soap and lock factories, better electric light equipment, modern homes for workmen, are a few of the industrial and civic advances. Port construction, now well advanced, has already cost \$20,000,000; additional construction is in progress, including a new light system (1925) and the deepening of the inner harbour.

Recife exports sugar, cotton, lumber, tobacco and fruits. It ranks fourth in Brazilian exports of foods and raw materials and third as regards imports of foreign goods. The total commerce handled in a recent year amounted to 363,000 tons. More than 1,000 m. of railways radiate to interior regions, providing outlet through Recife. (W. A. R.).

**RECLAMATION:** *see* COAST PROTECTION.

**RED CROSS** (*see* 1.801), the national and international organisation for the care of the sick and wounded in war, the assistance of prisoners-of-war, and other humanitarian purposes.

## I. THE INTERNATIONAL MOVEMENT AND THE NATIONAL SOCIETIES

The international Red Cross Committee, founded in 1863 by Henri Dunant and a group of prominent citizens of Geneva, promoted two diplomatic conferences which drew up the Geneva Convention of Aug. 22 1864 (revised July 6 1906) and supplied the international legal basis to the work of the Red Cross. The International Committee was constituted to supervise the observance of the Geneva Convention, to found and develop Red Cross societies throughout the world, to act as an intermediary between governments, peoples and groups of various nationalities for mutual assistance and relief for victims of war, sickness, etc. The various societies meet at intervals in international conferences. The 9th conference, held at Washington in 1912, dealt chiefly with relief for prisoners of war. The Red Cross emblem (red cross on a white background) displays the arms of Switzerland reversed, and was adopted in honour of that country.

The work of the Red Cross during the wars which have occurred since its foundation has been steadily extended. The War of 1914 necessitated a very great development, especially as regards collaboration with the various military medical services; care of the wounded, formation of hospitals and detachments of nurses; relief for prisoners-of-war and their families; building of hospitals; supplies; hospital transport; canteens; relief for war victims in the various countries; relief of civilians in distress and of refugees, etc.

*National Organisations During the War.*—The belligerent countries naturally made great efforts on behalf of their own nationals. The British and American services are dealt with separately at the end of this article. Perhaps the most remarkable of the other efforts was that of Germany, where the Red Cross mobilised a total auxiliary medical service of 250,770 persons, and organised 85 hospital trains and floating ambulances, 3,470 hospitals and convalescent homes, 500 portable Döcker barracks, 508 homes for the troops, 490 supply stations and 421 hospital posts for men on leave. The Italian Red Cross treated close on 700,000 wounded and collected funds amounting to 51,000,000 lire. Nearly 18,000,000 parcels were sent to Italian prisoners-of-war. Of the neutrals, the Danish Red Cross organised a large service for the transmission of letters and parcels to prisoners of

war in Austria, Germany and Russia, and for distributing literature to internment camps. The Prisoners Bureau at Copenhagen had branches at Berlin, Moscow, Vienna, Paris, etc. The Danish Red Cross played an important part in the prisoners of war conference between Russia, Rumania and the Central Powers at Copenhagen in 1917. The Dutch Red Cross gave much assistance to Belgian refugees, and assisted interned prisoners and the exchange of invalids and health personnel. The Swedish accomplished much relief work, especially regarding Germany and Russia. The Swiss organised the repatriation through Switzerland of severely wounded prisoners (80,377 men) and the internment in Switzerland of sick prisoners.

*International Committee During the War.*—In 1914, the International Red Cross Committee set up at Geneva the International Prisoners-of-War Agency, with departments of prisoners-of-war and missing men of the Entente countries (12 sections, dealing with 30 countries); prisoners-of-war and missing of the Central Powers (4 sections); and interned and deported civilians, hospital staff, hostages and refugees. Between 1914-8, more than 20,000 people came in person to Geneva to obtain information. The daily post varied between 2,000 and 15,000 letters. The total number of index cards was over 5 million.

There was a special department for naval prisoners-of-war, or men missing at sea. Further, the International Agency made enquiries about men missing on the field, dealt with the transmission of relief to and the repatriation of families in the invaded areas, with the repatriation of deported workers from reprisal camps, and of members of the ambulance corps. The International Red Cross Committee sent numerous delegates to inspect prisoners-of-war and civilian internment camps in Europe, Asia and Northern Africa. Printed reports on these visits were issued regularly. Further, the International Committee made the necessary protests against violations of the Geneva convention. Thus, on Sept. 21 1914, it reminded belligerents of their duty strictly to observe the 1906 convention concerning the care of sick and wounded without distinction of nationality. It also drew attention to the neutrality of the ambulance staff, to the desirability for suspending hostilities for the identification and burial of corpses, to the question of the bombardment of hospitals and the illegal treatment of sanitary or Red Cross staff; the question of reprisals; the protection to be afforded to hospital ships. As a result of steps taken by the International Committee, the Swiss Govt. proposed the negotiations between belligerent countries for the repatriation of invalid prisoners-of-war. In Feb. 1915, the International Committee took steps also to secure the internment in neutral countries of sick prisoners.

*International Committee after the War.*—Among the activities of the Red Cross Societies in repairing the effects of the War may be mentioned: repatriation (with assistance of the League of Nations) of 300,000 Russian prisoners stranded in Germany, and 150,000 German and Austro-Hungarian prisoners detained in Russia and Siberia; delegations for distribution of emergency relief and protection of hospitals and charitable institutions and of aliens during the civil wars in Russia (1918), Hungary (1919), Upper Silesia (1921); visits to political prisoners in the Ruhr (1923), Ireland (1923), Poland (1924), Montenegro (1925); relief to starving populations in Poland, Austria, Hungary (1919-22), Anatolia (1922), Germany (1923-4), Albania (1925), Syria (1925); the maintenance of a central office in Vienna to fight epidemics, co-ordinating with work in Poland, Galicia, the Ukraine, Rumania and Austria; work in the Ukraine against spotted typhus (1919-20); anti-malarial work and general medical study in Georgia (1923); relief for the 1,500,000 Russian refugees in Europe (1920), assisting the League of Nations when it took over this question in 1921; relief and hospital work among Greek refugees from Asia Minor (1922)—commission for the exchange of prisoners-of-war between Greece and Turkey; and evacuation of Russian refugees in Manchuria, in collaboration with the International Labour Office (1925).

*Activities after the War.*—Special work was undertaken by national societies, including the work of French, Belgian, British and American Societies, in re-establishing sanitary conditions in

the devastated regions of France and Belgium; similar work in the Baltic States, Poland, the Ukraine, Asia Minor; first aid and medical treatment to distressed populations in Austria, Hungary, Germany, Russia, Asia Minor and China (during the famine); work against epidemics; co-ordinated measures against exanthematic and recurrent typhus in the Ukraine; against malaria (Italian Red Cross); a tropical institute for prevention of malaria (Georgia); summer hospitals (China); campaign against epidemics among the natives (Siam, Dutch East Indies, Congo). Many societies organised relief for the sufferers from special disasters, notably: cyclones and fires (America); cyclones, fires, burst dams (Holland); floods (China); earthquakes and cyclones (Central and South America); eruptions, earthquakes, fires (Italy); earthquakes, especially that of Tōkyō, Sept. 1923 (Japan). Still another branch of activity was the evacuation of the wounded in case of accidents, disasters, civil war, revolutions in various countries (Portugal, Germany, Russia, China, Central and South America).

The system of training nurses and hospital helpers was reorganised and directed mainly towards intensifying health propaganda and performing emergency relief work. In Germany, nurses were especially trained for campaigns against epidemics and tuberculosis; in France for work with occupying troops in Rhineland, Upper Silesia, Morocco, Tongking, Syria; in the French devastated areas, against tuberculosis and for protection of children; in England as visiting nurses in slum areas. National societies also established special hospitals, sanatoria, preventive institutes, orphanages and dispensaries; they conducted propaganda for the increase of Red Cross membership, especially among young persons; they organised social hygiene courses and lectures to encourage campaigns against tuberculosis, cancer, venereal disease and further hygiene in general. Many homes for children and colonies for sick children have been established to combat tuberculosis. Lessons in hygiene have been organised in schools; the Italian Red Cross alone has given assistance to over 50,000 children.

*League of Red Cross Societies.*—In 1919, on the proposal of Mr. H. P. Davison, President of the American Red Cross, the American, British, French, Italian and Japanese Red Cross societies founded the League of Red Cross Societies, to encourage in all countries the development of a duly authorised national Red Cross organisation, the object of which is to improve health conditions, to prevent disease, to contribute to the general well-being by placing new scientific discoveries at the disposal of everyone, and to act as an intermediary for the co-ordination of various relief works in the event of disasters, national or international.

The League is managed by a general council and a board of governors, and since 1922 its headquarters have been at Paris. It includes departments dealing with international relief, propaganda, publications on hygiene, tuberculosis, venereal disease, the protection of children, visiting nurses, the Junior Red Cross, etc. The League has adopted as a symbol the Red Cross in a star with five points, symbolical of the five Red Cross societies which founded it.

*International Conferences.*—International Red Cross conferences were again convened from 1921 onwards. The 10th Conference (Geneva, March 30 to April 7 1921), surveyed the activity of the various national Red Cross societies during the War, and drew up a programme for the future. It also adopted resolutions concerning the limitation of war, the preparation of a diplomatic convention concerning prisoners-of-war, civil war, and the international organisation of the Red Cross; and prepared a draft revision of the Geneva Convention.

The Eleventh Conference (Geneva, Aug. 28 to Sept. 1 1923) considered the situation of civilians in the power of the enemy, and drew up a scheme of international relief for populations stricken by disasters. This report was drawn up by Senator Ciraolo, President of the Italian Red Cross, and after having been submitted to the Council and Assembly of the League of Nations in 1925, is now being considered by a special committee of enquiry.

The 12th Conference (Geneva, Oct. 7 to 10 1925) which was attended by 170 delegates representing 39 governments, 44 Red Cross societies and 20 other institutions, drew up the present programme for the work of the Red Cross societies, confirming, on the basis of past experience, the work of the national societies in time of war, and laying down general principles for the development of Red Cross work in new fields.

The resolutions adopted at this Conference were concerned with chemical warfare, the relations between military medical services and the Red Cross societies, measures for diminishing the number of missing in war time, the situation of non-combatants on enemy territory, the immunity of hospital air-planes, relief for members of foreign legions, the work of the Red Cross in the event of the application of Article 16 of the Covenant of the League of Nations, relief for refugees, relief for Red Cross volunteers in the event of accidents or disasters, the creation of an identity card for members of Red Cross societies travelling abroad, the standardisation of sanitary material and the international organisation of the Red Cross. Further, an International Institute to consider the question of sanitary material was proposed, which should collect the various types of material in use in the various countries and organise competitions with a view to perfecting and standardising, as far as possible, such equipment as stretchers and other means of transporting the wounded.

*New Red Cross Societies.*—In 1912 the number of national Red Cross societies was 38. Between 1914 and 1925 the International Red Cross Committee officially recognised the following new societies: Luxembourg (1914); Poland, Czechoslovakia (1919); Finland, Siam (1920); Soviet Russia (1921); Costa Rica, Colombia, Paraguay, Estonia, Danzig (1922); Bolivia, Latvia, Ecuador, Albania, Guatemala, Lithuania (1923); Egypt, Panama, Persia (1924); Iceland, San Salvador (1925).

Various previously existing Red Cross societies have either ceased to function or have been replaced by others. The societies of Württemberg, Prussia, Hesse, Saxony, Baden and Bavaria have amalgamated into a single German Red Cross; in Montenegro, the society has ceased to exist; the Congo has become a part of the Belgian Red Cross; and the Russian Red Cross has been replaced by a new society.

See also *Reports of the National Red Cross Societies*.

## II. THE BRITISH AND AMERICAN RED CROSS

*British.*—All existing British Red Cross societies were amalgamated in 1905 into the British Red Cross Society, with the aim of preparing in time of peace for rendering first aid to the sick and wounded in war. The War Office undertook to receive all offers of such help only through the B.R.C.S. When the Territorial Force was formed in 1908, the War Office invited the Society to form Voluntary Aid Detachments for work with the Territorial troops. Both the B.R.C.S. and the Order of St. John set about organising these V.A.D.s for first aid work and assistance of the regular medical units during military operations. In fact, under the stress of the War, the Red Cross undertook much work which belonged strictly to the Army Medical Service. On the outbreak of war the B.R.C.S. and the Order of St. John appealed for funds.

A joint war committee of the two organisations was formed, all subscriptions were pooled, and this committee carried out almost all war work undertaken in Britain. Scotland acted separately, and the Dominions, notably Canada, Australia, South Africa and Egypt, sent their own detachments to the theatres of war. The Times fund for the British Red Cross realised over £16,500,000

in the course of the War, the four annual Empire "Our Day" collections producing over £8,500,000, of which more than five-eighths came from overseas. There were, besides, gifts of stores and gifts to local hospitals. The latter, which were in connection with military centres and controlled by a trained nursing staff and local medical men, assisted by V.A.D. nurses, were formed out of private houses, schools, etc., and usually received minor or convalescent cases. They were supported by local subscription with, when necessary, assistance from Red Cross Headquarters and a Government capitation fee per patient. Over 3,200 auxiliary home hospitals were opened during the War; large sums were also spent on equipping and maintaining hospitals abroad, special hospitals at home and convalescent homes. The stores department covered a great variety of items and involved extensive business arrangements with all the machinery of a large commercial organisation.

The Central Prisoners of War Committee administered a sum of over £4,000,000 and regularly despatched parcels to the prisoners' camps. Enquiries for wounded and missing were undertaken in 1915; 384,000 reports were obtained. Care was taken for interned prisoners in Holland and Switzerland. Particular attention was paid to the after-treatment of wounded or disabled men; both accommodation for convalescents and institutional treatment for patients suffering from neurasthenia, epilepsy, tuberculosis, paralysis and the effects of wounds. The first Red Cross detachment went to France Aug. 1914, the last to Vladivostok, Oct. 1918. The V.A.D. detachments before the armistice numbered 4,083 with a personnel of 125,993. The total staff of the joint Committee alone numbered 9,234. Although the general direction was in the hands of men, the outstanding feature—which every patient will remember till his death—was the self-sacrificing work of the women.

*American.*—The American Red Cross, founded in 1881 under the name of the "American Association of the Red Cross," was incorporated and nationalised in 1905 as the National Red Cross; the President of the United States became its president, and the War Department its auditor. Early in the World War the Red Cross offered through the State Department the aid of its trained personnel and contributors of hospital supplies to every belligerent country. This offer was accepted by almost all belligerents. A public appeal was made for funds, and soon large quantities of hospital supplies and about 200 nurses were sent to England, Belgium, France, Germany, Austria, Serbia and Russia. Seventy-one physicians and surgeons were also sent, and a special sanitary commission went to Siberia to fight the typhus plague there. The value of relief supplies sent to Europe by the Red Cross before the United States entered the War was over \$1,500,000, of which about \$350,000 worth went to Germany and Austria.

In May 1917 after America's entry into the War, President Wilson appointed a special Red Cross War Council under Mr. H. P. Davison, to direct the activities of the organisation during the War. A popular campaign for a special war fund realised \$100,000,000 in a week. The service was reorganised and quickly expanded from 500,000 members in 500 chapters to over 16,000,000 members. A further week's drive in May 1918 realised \$170,000,000, and the grand total 1917-8 exceeded \$400,000,000.

The American Red Cross recruited, organised and equipped hospitals and ambulance units, assisted in the care of the sick and wounded in emergencies, and provided nurses for the army and navy. It supplied comforts, clothing, medical supplies, surgical dressings; ran canteens, assisted the families of soldiers and sailors, photographed graves, etc. It supported 50 base hospital units, 40 overseas ambulance companies, over 23,000 trained nurses, a Women's Volunteer Motor Corps of 14,000 members, 92 convalescent homes in the training and embarkation camps, 130 canteens, 24 military hospitals and 12 convalescent hospitals in France, 33 canteens in Italy, 28 military hospitals and 82 canteens in Belgium. The "Civilian Relief Abroad" to the European populations was on a vast scale. \$1,000,000 a month were spent on relief to French and Belgian refugees in France, including help to over 150 national and local

French organisations. Over 30,000 tuberculosis patients were helped and a large children's welfare movement run. Substantial assistance was given in Russia; also in Belgium, Italy, Rumania, Serbia and Greece. The relief expenses included \$28,978,000 in America, \$57,207,000 in France, \$63,841,000 elsewhere overseas. A total of 101,000 tons of relief supplies were sent overseas; 3,780 French and over 1,500 Italian hospitals assisted. The value of the relief articles produced by volunteer workers during the War was estimated at nearly \$100,000,000. (G. Ad.)

**REDESDALE, ALGERNON BERTRAM FREEMAN-MITFORD**, 1ST BARON (1837-1916), British politician and writer (see 22,968), died at Batsford Park, Glos., Aug. 17 1916. He was succeeded as second baron by his second son, David Bertram Ogilvy Freeman-Mitford (b. 1877).

**RED INDIANS:** see INDIANS, NORTH AMERICAN.

**REDMOND, JOHN EDWARD** (1851-1918), Irish political leader (see 22,968), obtained for the first time a position of real power in Parliament after the general election in Jan. 1910. Though he had amalgamated the two Irish Nationalist parties under his own lead in 1900, he had never hitherto been able, owing to the large Unionist majority of 1900 and the Liberal majority of 1906, to hold that balance of power in the House of Commons which had proved such a formidable weapon in the hands first of O'Connell and then of Parnell. But the great reduction of the Liberal forces in Jan. 1910 made it impossible that Mr. Asquith's Government should long continue unless it found favour with Mr. Redmond.

The first use which he made of this new authority was to insist that Mr. Lloyd George's famous budget of 1909, on which the dissolution had turned, but which was not in itself greatly to the taste of the Irish party, should be postponed till after the constitutional resolutions directed against the House of Lords—his one object being to remove the veto of the Upper House, which was the main barrier against Home Rule. This order of procedure was also demanded by the Labour party and by the Radicals; and the Government complied. But Redmond did not trust them completely, and pressed for an assurance that the Royal prerogative would be at the Prime Minister's disposal to overbear any rejection by the Lords of the veto resolutions. He was impatient at the constitutional conference called in the summer at the beginning of King George's reign to endeavour to discover a solution by consent, and went to America to secure sympathy and funds. The conference having broken down, he conducted a strenuous campaign on behalf of the ministerial programme for the second general election of the year, in spite of a harassing movement on his flank by a small party of independent Nationalists under Mr. O'Brien and Mr. Healy, who accused him of having sold the Irish vote to the Government.

When the result of the polling had confirmed Mr. Redmond in his tenure of the balance of parliamentary power, he forwarded the progress of the Parliament Bill in 1911 by the steady vote of his party rather than by speech. In the autumn he was regularly consulted on the details of the forthcoming Home Rule Bill, and when the bill was introduced, in April 1912, he welcomed it as an adequate measure, and procured an enthusiastic acceptance of it from a nationalist convention in Ireland. His speeches during its passage through Parliament were, on the whole, moderate; he disclaimed separation but denounced any attempt to take Ulster out of the bill as a mutilation of Ireland. In token of the union of feeling between Nationalists and Liberals, he attended the meeting of the National Liberal Federation at Nottingham in Nov. 1912, and spoke for the first time on the same platform as Mr. Asquith. When the determined attitude of Ulster began to suggest to the Liberals the advisability of compromise, Redmond was very loth to agree, denouncing the Unionists and Ulster as engaged in "a gigantic game of bluff and blackmail." He insisted that Mr. Asquith's county option scheme was the extreme limit of concession. He was being pressed in Ireland by the rising power of Sinn Féiners and other extremists who had raised, in reply to Ulster, a great body of 100,000 Nationalist volunteers, over whom Mr. Redmond only obtained control in June 1914 after a sharp struggle.

Nevertheless he took part, at the end of July, in spite of Nationalist criticism, in the abortive Buckingham Palace Conference.

Then came the World War, and in the debate succeeding Sir E. Grey's famous declaration on Bank Holiday, Aug. 3, Redmond created a profound sensation by a speech in which he declared that the events of recent years had completely altered the Nationalist feeling towards Great Britain. The Government, he said, might withdraw its troops from Ireland, whose coasts would be defended by her own sons, Nationalist volunteers joining with Ulster volunteers in the task. This generous attitude was met by the decision of the Government to pass the Home Rule Bill into law, suspending its operation till after the War. Redmond took an active part in promoting recruiting in Ireland, and stood on the platform in Dublin Mansion House on Sept. 25 by the side of the Prime Minister and the Lord Lieutenant. Unfortunately, owing partly to the anti-recruiting agitation promoted by Sinn Féin, and partly to red tape at the War Office, his efforts were only moderately successful. But he refused Mr. Asquith's offer to join the first Coalition Government, and he successfully opposed all attempts to apply conscription to Ireland. It was a stunning blow to him when the smouldering dissatisfaction of Southern Ireland broke out into a blaze in the Dublin rebellion of Easter 1916. He expressed in the House of Commons his detestation of the crime, and lent his assistance to the attempt which was made by the Government in the summer through Mr. Lloyd George to arrange an agreed settlement of the Irish question.

But the effort failed, and Mr. Duke, K.C., a Unionist, was appointed Chief Secretary; and Redmond treated the whole transaction as a fresh outrage on Ireland, moving on Oct. 18 a resolution (which was, of course, rejected) charging ministers with maintaining a system of government in that country inconsistent with the principles for which the Allies were fighting in Europe. Next year he threatened a return of his party to the old obstructionist opposition; but when in May 1917 Mr. Lloyd George, as Prime Minister, suggested an Irish convention to produce a scheme of self-government, Redmond agreed; and in the convention he played a prominent and conciliatory part, making in particular a favourable impression on the Southern Unionists. During its sittings, however, his health failed. He died of heart failure in London on March 6 1918.

John Redmond's younger brother, WILLIAM HOEY KEARNEY REDMOND (1861-1917), intended, as a young man, to adopt the army as his profession, and in 1881 he was a lieutenant in the Co. Wexford militia battalion of the Royal Irish Regiment. But he resigned his commission to take part in the Land League movement and was imprisoned as a "suspect" in Kilmainham. He was returned for Wexford borough in 1883, and sat in Parliament, though for different constituencies, from that time till his death. He was of an ardent and ebullient temper, which resulted in his spending three months in Wexford gaol in 1888 for inciting, at an eviction, to resistance to the sheriff, and in many agitated scenes at different times in the House of Commons, where, however, he was personally very popular. Like his brother, in the Nationalist split he adhered to Parnell, and, also like his brother, on the outbreak of the World War he instantly recognised the duty of Ireland to fling herself into it on the side of the Allies. Though 53 years old, he joined at once the Irish Division, receiving a commission in the Royal Irish Regiment. He was promoted major for services at the front and mentioned in dispatches. In his intervals of service he made two thrilling speeches in the House of Commons, advocating conciliation, and a new start, between England and Ireland. He died of wounds in France on June 7 1917. (G. E. B.)

**REDWOOD, SIR BOVERTON** (1846-1919), British chemist, was born April 26 1846, and educated at University College School, London. He was trained as a pharmacist, but early specialised in the study of petroleum, becoming in 1869 secretary of the Petroleum Association and subsequently studying oil conditions at first hand in many parts of the world (1883-6). He served on several important Government commissions both before and during the World War. Founder of the Society of Petroleum Tech-

nologists, he became its first president 1913-4 and he was also a member of many other societies in pure and applied science. He was knighted in 1905, was made a baronet in 1911 and died in London on June 4 1919. Sir Boverton wrote some standard books on his subject, including *Petroleum*, 3 vol. (1913); and many articles and pamphlets.

**REFERENDUM** (see 23.1).—Switzerland during the period 1910-25 continued freely and frequently to use the referendum, which had been made general and compulsory by its constitution of the year 1848. By means of referenda (a) proportional representation was rejected in 1910 and 1912, but accepted in 1918; (b) measures were carried in favour of sickness and accident insurance (1912), a war tax on fortunes over a certain sum (1915), a special levy to clear off the war debt (1919), restriction of the liquor traffic (1920), entry into the League of Nations (1920) and an eight-hour day for Government employees (1920), and (c) proposals were rejected which advocated female suffrage (1920), a capital levy (1922), extended state control over the liquor traffic (1923) and modification of the eight-hour day in certain emergencies (1924). In some cantons, among which Zurich was pre-eminent, the employment of the referendum for the settlement of such questions as the route of tramways, the construction of bridges, or the site of public buildings, was so regular as to constitute the virtual establishment of a direct democracy. (See N. Ornstein-Brodsky, *Das Referendum in der Praxis. 25 Jahre Gemeindeabstimmung in Zürich*. Vienna, 1920.)

*The United States*.—The legislative referendum was formally adopted by Arkansas and Colorado in 1910, by Arizona, California and New Mexico in 1911, by Nebraska, Idaho, Ohio and Washington in 1912, by Michigan in 1913, by Mississippi and North Dakota in 1914, by Maryland in 1915, and by Massachusetts in 1918. Its chief adherents still lie west of the Mississippi River, only five eastern states having adopted it, i.e., Maine, Massachusetts, Maryland, Ohio and Michigan,—and 26 states have made no provision for direct legislation. In those states which have incorporated its principle in their legislative machinery, its use has not been commensurate with the claims which its advocates made for it.

On the other hand the constitutional referendum, which contemplates only proposed amendments to the state constitutions, is in force in every state with the exception of New Hampshire and Delaware, and this is the form in which the referendum has been usually resorted to in recent years. The constitutional problems most persistently laid before the electors for decision were female suffrage and prohibition. As a result of referenda, the suffrage was given to women in some states, e.g., Washington in 1910 and California in 1911, but refused in others, e.g., Oklahoma in 1910 and South Dakota in 1911. The subject of prohibition was thrashed out over almost the entire United States by means of referenda, until the matter was removed from the cognizance of the state legislatures and electorates by the eighteenth (prohibition) amendment to the federal constitution. Apart from the wider state spheres of action, the referendum has been adopted in local government matters, particularly in the matter of money bylaws which in certain circumstances have to be submitted to the taxpayers for their approval, and also in connection with the adoption or otherwise of the commission and city manager systems of municipal government.

*British Empire*.—Great Britain has not adopted the referendum, but since the abolition of the Lords' veto in 1911 its adoption has been urged by a number of influential men. On March 2 1911 Lord Balfour of Burleigh introduced a Referendum Bill, but, after an interesting debate, the measure was rejected.

In Australia the referendum, which had been employed only once before 1910, was used on several important occasions during the subsequent 15 years. In 1910 itself a referendum authorised the transference of the debts of the various states to the Commonwealth Government. In 1916, and again in 1917, the vital question of extension to service abroad of the compulsory enlistment (which was already in use for home defence) was referred to the Commonwealth electorate and on each occasion rejected—in 1916 by 1,146,000 to 1,085,000 and in 1917 by

1,181,000 to 1,015,000. In 1911, 1913 and 1919 amendments to the Commonwealth constitution of a Socialistic tendency were all rejected. Similarly in the separate States of the Commonwealth, e.g., Victoria 1920 and Queensland 1923, proposals in favour of prohibition were defeated by large majorities. There can be no doubt that in Australia the referendum has proved to be an obstacle to innovation.

*New Zealand* used the machinery of the referendum in 1911, 1914, 1919 and 1922 in order to discover the will of her people respecting this same vexed question of prohibition. On each occasion, although by dwindling majorities, prohibition was rejected.

*Canada.*—The referendum in the legislative sense has, when resorted to, been as a rule the result of special laws, and particularly on the question of prohibition. The suppression of the liquor traffic was thus carried out in Alberta, 1915, Manitoba, British Columbia and Saskatchewan in 1916, and Ontario in 1919. In 1920, however, British Columbia by means of a referendum, reversed its decision and adopted a system of government liquor control,—an example subsequently followed by Manitoba, Saskatchewan and Alberta. Under United States influence the referendum has been widely introduced into local government matters, more particularly as regards the submission of bylaws about money to the people, and in this restricted sense has operated successfully, though upon occasions it has proved difficult to induce any large number of voters to exercise the franchise.

*European Countries.*—Three constitutions framed since the War incorporated the referendum as part of the machinery of government. The German constitution of 1919 empowers the President to order a referendum when he sees fit, and provides it also as a means of escape from a conflict between *Reichstag* and *Reichsrat*. It was used on June 20 1926, to decide the question as to whether or not property of the Hohenzollerns or other former ruling houses should be confiscated. Over 15,000,000 votes were cast for confiscation, but, as less than half the total votes was polled, the proposal failed. (See GERMANY.)

The Estonian constitution of 1920 uses it as a means of resolving a deadlock between the two houses of legislature. The rejection of a measure passed by the representative assembly involves the dissolution of the assembly and a general election within 75 days.

The Irish Free State constitution, 1922, requires a referendum to be taken on any measure passed by the Dail, if a demand is made by either one-fifth of the Senate or one-twentieth of the electorate. (F. J. C. H.)

Dodd, *Revision and Amendment of State Constitutions* (Baltimore, 1910); S. R. Honey, *The Referendum among the English* (1912); W. B. Munro, *The Initiative, Referendum and Recall* (1912); R. B. Wise, *The Making of the Australian Commonwealth* (1913); I. D. Barnett, *Operation of the Initiative, Referendum, etc., in Oregon* (1915); A. L. Lowell, *Governments and Parties in Continental Europe* (1918); Foreign Office Handbooks, No. 159, *Plebiscite and Referendum* (1920); E. Kimball, *State and Municipal Government in U. S. A.* (1922); H. L. McBain and L. Rogers, *The New Constitutions of Europe* (1922).

**REFORMATORY SCHOOLS** (see 23.22). *Great Britain.*—Reformatory and industrial schools (see also CHILDREN'S COURTS; PROBATION) in Great Britain are institutions for the reception of neglected children and young offenders under the provisions of the Children Act 1908, as amended in 1921. They are conducted by voluntary bodies of managers, or in a few cases by local authorities, and are under the general supervision in England and Wales of the Home Secretary and in Scotland of the Secretary for Scotland. Their net cost is shared equally between local authorities and the state. The position of the schools was fully reviewed by a departmental committee which reported in 1913.<sup>1</sup> As a result of their recommendations, a number of important changes were made in the organisation and management of the schools, and in the character of the education and training given in them.

<sup>1</sup> *Report of the Departmental Committee on Reformatory and Industrial Schools*, Cd. 6838 (1913).

One of the most striking features in the history of the schools has been the fluctuation, during and after the War, in the annual number of committals to them. The number had maintained a fairly steady level in the years preceding the War; but it was symptomatic of the disruptive effect of the War on family life that between 1913 and 1916 the annual committals of boys to reformatory schools increased by nearly 70% and of boys to industrial schools by over 15%. The number of committals fell sharply in 1919 to a point far below the pre-War level, and has continued to decrease, though the experience of 1924 and the two preceding years suggest that a period of stability may have again set in. As a result of the decrease it became necessary to close a considerable number of schools. During later years the so-called "short term schools" for truants have been merged with the ordinary industrial schools (*q.v.*), and the day industrial school has largely disappeared.

The general trend of progress in the remaining schools has carried them far towards the realisation of the high ideals by which the enlightened founders of the movement were inspired. While the law preserves a distinction between the two classes of schools, the reformatory being a training institution exclusively for young delinquents and the industrial school having the primary purpose of a home for children who by reason of the criminal, immoral or neglectful habits of their parents are in danger of falling into delinquency, the problems with which the two classes of schools have to deal are in the main similar, particularly since under the Children Act 1908 young offenders under 12 years of age may not be sent to reformatories, but are eligible for industrial schools, which may also receive first offenders up to 14 years of age. The distinction, therefore, is tending in practice to disappear.

In the reformatory school of to-day nothing remains of the old idea of retributive punishment, so long perpetuated in the prison-like uniform, the cropped head and the routine of monotonous labour. In an increasing degree, the methods of repression have given way to a régime of freedom and encouragement combined with a wise discipline. Corporal punishment becomes less and less necessary; absconders are comparatively infrequent. In many industrial schools boys and girls are able to attend the ordinary elementary or secondary schools in the district. In both classes of schools special encouragement has been given to early release on license, and to the development of an effective system of after-care. Every pupil is released on license as soon as his progress and the general circumstances justify it, and he then remains under supervision—actively exercised and including power to recall him, if necessary, to the school—until the age of 19 if the school is a reformatory or 18 if it is an industrial school. In all schools boys and girls are given, by a system of rewards and privileges, by the grant of home leave and not least by participation in organised games and healthy recreations, every incentive to develop for themselves those qualities of self-respect and self-reliance which will best equip them for an after-life of good citizenship.

*United States.*—The reformatory system of the United States, as distinguished from the penitentiary or prison system, may be considered under two heads: (a) reform schools and industrial schools for youths under 16 or 18 committed for violations of the criminal law or for the want of proper guardianship, and (b) reformatories for older adolescents between the ages of 16 or 18 and 30 convicted of criminal acts; the former is an outgrowth of the Houses of Refuge, which developed in the early part of the 19th century, under private and charitable organisations.

Beginning with the last quarter of the 19th century, a number of states established Industrial Schools or State Homes for the correction and training of their delinquent youths. The reformatory for older adolescents had its birth in the United States in 1869, when the New York State Legislature enacted legislation and appropriated funds to build the New York State Reformatory at Elmira. This legislation was brought about largely through the efforts and influence of Dr. E. C. Wines, Dr. Theodore Dwight, and Mr. Z. R. Brockway, who became the first superintendent and was responsible for the development of the Elmira Reformatory system of academic and trade training, which is still regarded as the best of its kind in the United States. Almost every state in the American union has at least one reformatory. In practically all cases the system of discipline, training and release established at Elmira has been more or less followed. The indeterminate sentence is an integral part of

the American reformatory system; the principles of this system of release were embodied in the first legislation establishing the procedure for operating the reformatory in 1877.

The U.S. Govt. opened its first Federal reformatory for adolescent male offenders in March 1926, at Chillicothe, Ohio. Prior to this time, male offenders of all types over 16 years of age were received at the Federal penitentiaries. In 1926 there was under construction in West Virginia a Federal Reformatory for adolescent females; this will be in operation before the close of the year. The Federal Govt. follows the practice of boarding many of its offenders in state reformatories and county workhouses.

**REFRIGERATION** (see 23.30).—By this term is meant the artificial control of the humidity and temperature of the air, or of the temperature of commodities when these temperatures are below that of the atmosphere.

In accordance with the second law of thermodynamics (see 26.8o8) these ends are accomplished by the use of a reversed engine, for, in the refrigerating cycle, heat is absorbed at the lower temperature and rejected at the upper temperature, a process which is the reverse of that performed by the ordinary heat engine. But similar to the conditions in the steam-engine cycle, a working medium, in this case a refrigerant is used to carry out the cycle of operations. This refrigerant is a volatile liquid such as ammonia, carbon dioxide, sulphur dioxide, butane or propane, but ammonia is used more extensively than any of the others.

In the refrigerating cycle, the refrigerant is made to pass into the evaporating coils so as to enable heat to be absorbed from the commodity to be cooled. During the absorption of this heat, the refrigerant is evaporated. As it is essential, for reasons of convenience and economy, to return the refrigerant back to the liquid state, the medium must be compressed to such a degree as will enable the liquefaction to occur under atmospheric temperature. The result is a closed cycle using the same medium continuously, and the cycle includes a heat-absorbing system at the lower temperature (usually called the refrigerator); a heat-rejecting system at the upper temperature (frequently called the source); a reversed motor, usually a compressor; and a pressure-reducing device, which is preferably an expansion cylinder, but is always a throttling valve when liquids are handled. The theoretical cycle can be brought out clearly by means of an illustrative example:—

*The Problem.*—A reversed Carnot engine is used for refrigeration. The temperature of the refrigerator is  $-10^{\circ}\text{F}$ . and that of the hot body is  $80^{\circ}\text{F}$ . Find the horsepower required to drive the motor if 10,000 B.T.U. are to be taken from the cold body per minute. The efficiency of the cycle is

$$E = \frac{T_1 - T_2}{T_1} = \frac{540 - 450}{540} = 0.1667$$

Therefore  $0.1667 = \frac{Q_1 - 10,000}{Q_1}$  or  $Q_1 = 12,000$  B.T.U., from which

the work done,  $AW = 2,000$  B.T.U. per minute  
 $= 2,000 \div 42.44 = 47.1$  horsepower

*Unit of Refrigeration.*—The unit of refrigeration is defined differently in different countries. The British rating is the production of refrigeration at the rate of 1 calorie per sec., or 342,860 B.T.U. per 24 hours. The American rating is slightly less and is given as the cooling rate of 200 B.T.U. per min. or 288,000 B.T.U. per 24 hours. A machine having such a capacity for cooling is said to have a rating of 1 ton of refrigeration.

*Refrigerants.*—According to the second law of thermodynamics all refrigerants (working media) have the same efficiency, although this is not achieved in practice, and a large number of volatile liquids, as well as air and steam, have been tried with varying success. At the present time ammonia, carbon dioxide and sulphur dioxide are used in the order named, and air and water are practically abandoned. Ammonia is preferred because of its large value of the latent heat of vaporisation and its nomi-

nal pressure (of less than 200 lb. per sq. in. as a rule). Carbon dioxide is preferred on account of its "safety" factor, as the gas cannot explode, will put out fires, and is practically innocuous. Hence carbonic refrigeration is popular in the United States for theatre cooling and marine work. For the latter application the decrease in compressor size, as compared with ammonia machine requirements, the decrease in weight and the fact that a copper condenser can be used with carbon dioxide without corrosion, are all advantages. Sulphur dioxide has no friends in America, except in the case of the 1/20-, 1/10- and the 1/6-ton household machines, whereas in Germany, and to a lesser extent in Great Britain, the sulphur dioxide compressors are used in large sizes.

*Brine or Direct Expansion.*—Refrigeration can be accomplished by two separate methods; by the direct use of the refrigerant in the cooling coils—direct expansion—and by the use of a non-freezing solution, previously cooled by the refrigerant—the brine system. In cold-storage refrigeration, and in the packing-houses, either system will be found in about the same proportion. When brine is used it is almost always calcium chloride, especially for temperatures below  $15^{\circ}\text{F}$ . Brine can use ordinary (full weight) piping and the usual fittings for 150-lb. pressure, but direct expansion requires for ammonia special fittings of air-furnace, cast-iron or drop forgings.

Brine has a cheaper pipe system in first cost, but both supply and return pipes have to be insulated. A brine circulating pump is required, and brine requires a lower suction pressure on the refrigerating machine than does direct expansion. With the brine system a storage capacity is possible, a factor not possessed by direct expansion, and therefore the refrigerating machine does not have to run continuously. It is considered safer to use brine, as the ammonia cannot, under these conditions, cause damage should an accident occur to the piping. In special cases brine is preferred, as for example, in the case of the chilling of castings, and in brine spray systems in the packing houses.

*Types of Compressors.*—In marine work the compressor is nearly always a vertical one. In Great Britain very few horizontal compressors now are being installed, whereas the horizontal, double-acting ammonia and carbon dioxide compressors are common in the United States. In Great Britain the preferred type of compressor is that with the enclosed crank case, and with 2, 3 and even 4, vertical cylinders, designed either for single or double acting. In America the preference appears to be for the twin vertical single-acting enclosed crank case compressor up to 75 tons capacity, and for the use of 3 cylinders in the larger sizes, but the double acting, vertical compressor is never used. The horizontal, slow and medium speed double-acting machines are used in sizes of 75 tons capacity and upwards.

*Valves.*—The valves used in refrigerating compressors have been modified recently, due to the general desire to increase the rotative speed. The old type of poppet valve is not now used to any extent, although the modified type of poppet valve of light weight is used as a "balanced" suction valve in the piston, and, when necessary, a number of light-weight poppet valves are used for the discharge. The favourite type of valve is the ring plate valve made of special steel, hardened and ground, or of the thin steel ribbon valve. These valves are placed in cages and are identical for suction and discharge except for the direction of the opening of the valve. The smaller of the enclosed type compressors, both for ammonia and carbon dioxide, have rotative speeds up to 600 revolutions per minute.

*Type of Drive.*—While the steam engine was formerly the only prime mover, in 1926 the Diesel engine or the electric motor, was used almost exclusively for refrigerating machines. The electric motor used is the direct-current type in special cases, but usually the squirrel cage, or the wound rotor type of induction motor. Since 1915 there has been a great demand for the synchronous motor, even for such small capacities as 15 tons. When the synchronous motor is used, clearance pockets are frequently installed in the compressor head in order to vary the capacity without shutting down the machine. This can be done without much loss of operating efficiency.

*Cold Storage and the Packing-house.*—By keeping fruits, vegetables, eggs, fish, poultry, and meats in cold storage, the natural processes of decay can be retarded and eatables can be carried over from the period of heavy production to the season when the fresh commodity would be scarce or unavailable. Cold storage means the maintenance of a fixed temperature and humidity, at the conditions best suited for the goods being stored. In the packing-house the animal heat must be removed from the

carcasses quickly. If put in storage the meat must be kept at a temperature near 32°F., but if shipped to any distance it must be frozen. The average time between slaughtering and consumption is slightly more than two months. By means of refrigeration it is possible to organise large control slaughter houses, under government inspection and the best sanitary conditions, with shipment to all points by means of refrigerator cars. The modern packing-house means wholesome food to an extent impossible with the local butcher.

The object of cold storage being economic, there is no object in holding except to preserve the surplus supply until the demand permits its use. Although foods may be kept in good condition much longer than the intervals named below, U.S. Govt. reports give the average length of storage for various articles as:—

|                           |             |                  |             |
|---------------------------|-------------|------------------|-------------|
| Eggs . . . . .            | 5.91 months | Beef . . . . .   | 2.28 months |
| Dressed poultry . . . . . | 2.42 months | Mutton . . . . . | 4.45 months |
| Butter . . . . .          | 4.43 months | Pork . . . . .   | 0.88 months |

Fruits, particularly the apple, can be kept in cold storage satisfactorily, and the same is true of vegetables like lettuce, celery, potatoes, etc. Berries and some soft fruits have been kept in a frozen condition for from 6 to 10 months, and were then reported to be equal to fresh fruit for most purposes.

*Eggs, Fruit, Poultry, Fish, etc.*—Commodities of the best quality only should be put in cold storage, except in the case of eggs frozen in bulk. Apples should be held at 31°F. with an average relative humidity of 85%. Fresh air circulation does not show any advantage, but a lively circulation of air to each individual apple is required in order to reduce scald. The amount of carbon dioxide in the air should be less than 12%. The egg should be kept at a temperature of from 29° to 32°F. with a relative humidity of 85%. Ventilation must be provided by careful storing with strips  $\frac{3}{4}$ -in., or thicker, between the boxes and 2-in. strips on the floor. Poultry should be carried at 2°F. or lower, and should be stowed with at least 1-in. dunnage. Poultry should be dry-picked and dry-packed in clean, well-made boxes, 12 birds to the box, and each one separately wrapped, and the box lined with a good paper.

Fish are washed free of dirt and the larger ones are gutted. Pans containing about 40 lb. are placed in sharp freezers at from -5° to -15° Fahrenheit. As soon as the fish are reduced in temperature they are glazed by being made to pass through a trough of water at 32°F., or they are placed in a grilled platform and are lowered into the water. After glazing, the fish are held at from 0° to 10° Fahrenheit.

*The Manufacture of Ice.*—The use of manufactured ice is becoming more and more a necessity, although in the United States the small household refrigerating machine has been taking to a great extent the place of ice in the cities. The average amount of ice consumption *per capita* in the larger cities of the United States is estimated at 1,000 lb. per year and this amount is increasing steadily. The use of natural ice diminished during the years 1910-26 very rapidly in the city retail trade because of its uncertainty from year to year, its irregular size and indifferent appearance, and the idea that it is unsanitary. The bulkiness of artificial ice practically requires its use near the point of its manufacture, although railroad freight and auto-truck shipments expand the range of its use somewhat. The total production in the United States in 1919 was 28,000,000 tons of 2,000 lb. each as compared with 21,000,000 tons in 1914. As an estimate has been made that only  $\frac{1}{3}$  of the families in the United States at present use ice at all, there appears to be an opportunity for an appreciable increase.

In ice-making, mechanical refrigeration is used to the extent of about 1.6 tons of refrigeration per ton of ice (daily capacity). The present preferred system uses deep well or city water, not distilled as formerly, and air agitation during freezing. Commercial freezing is accomplished by immersing galvanised iron cans holding 300 and 400 lb. of water in a brine bath held at a temperature of from 14° to 20° Fahrenheit. Air agitation at from 3 to 12 lb. per sq. in. pressure is resorted to in order that the ice block shall be transparent, a condition required by the retail trade.

The brine is kept cold by means of ammonia piping between the cans in the brine, or by the use of the shell and tube brine cooler submerged in the brine in the ice tank. The 300 and 400 lb. cans require from 40 to 45 hours for freezing, and are removed to the dumping platform by means of a travelling crane which handles as a rule from 6 to 24 cans at a time. When electrically driven machinery is used, a ton of ice can be produced with the expenditure of from 35 to 55 kw. hour, depending on the time of the year, the condenser pressure and other details in the plant. When crushed ice is desired, the manufactured ice does not have to be transparent, and the air agitation in the cans can be omitted.

*Cooling of Milk and Manufacture of Ice Cream.*—When milk is transported some distance, especially for urban distribution,

the time between production and consumption is over 24 hours; even frequently 48 hours. This means that it is imperative to cool the milk quickly and to keep it at a temperature of 50°F. or lower. Pasteurised milk is becoming more general in use, and refrigeration must be resorted to in all cases where a liberal supply of cold water is not available at slight cost and where the use of ice and salt is not economical. Mechanical refrigeration is often resorted to because of its easy control of temperature and its cleanliness. The amount of refrigeration required in cooling milk varies with the rate of cooling, as the desire frequently is to hasten the process in order to deliver promptly. Roughly, one gallon per min. will require  $1\frac{1}{2}$  tons of refrigeration, assuming that the milk is cooled 30°, say from 70° to 40° Fahrenheit.

The ice cream industry is increasing rapidly in the United States and Great Britain. In 1924 the number of wholesale plants engaged in the manufacture of ice cream was estimated at 4,000. The estimate of the U.S. Dept. of Agriculture for 1920 indicated a total production in that country of 260,000,000 gal., and the rate of factory-produced cream in the cities of from 4 to 5 gal. per year *per capita*.

In the manufacture of ice cream it is usual to allow one ton of refrigeration per 60 gal. of cream, including freezing, hardening, storage, etc. Calcium chloride brine has been used almost exclusively, at about 0°F. in the freezer, but direct expansion is now being used somewhat. The cream is cooled to about 25° in the freezer, and is then placed in containers for storage in the sharp freezer held at from 0° to -10° Fahrenheit. Ice cream is usually held in storage for a day or two to improve the flavour.

*Cooling of Buildings.*—Public buildings in the larger cities of the United States, like Chicago, New York, St. Louis, etc., use refrigeration to make the air more comfortable during the hot summer. The method is to utilise the ventilating systems already installed and provide the same amount of air per person, but the air must be cooled from 8° to 15°F. below the temperature of the outside air. Too great an amount of air cooling has been found unwise, and the relative humidity should be between 65 and 75%. For this purpose spray nozzles are employed, using water at about 45° to 50°F., and usually direct expansion coils at the entrance to the spray chamber. These coils act as air and water coolers, and no fear of the refrigerant is entertained because of the negligible danger of a panic, or of the after effects to people should even relatively large amounts of carbon dioxide gas enter the auditorium.

In theatre ventilation and cooling the amount of recirculated air effects the tonnage, but where 50% of the air is permitted to be returned to the washer to be cleaned and cooled, and the other 50% is fresh air, the load is from  $2\frac{1}{2}$  to 3 tons of refrigeration per 1,000 cu. ft. of air per min. passing through the spray chamber, in localities having summer conditions comparable with Chicago. Roughly, the amount required to cool and condition the fresh air is twice that required to cool the recirculated air. In the latter case the load on the machine is that required to neutralise the effects of heat leakage, the heating effects of the people and the illumination and to condense the moisture exhaled by the audience. (H. J. M.)

**REFUGEES AND THE EXCHANGE OF POPULATIONS.**—In the early history of European civilisation wars and conquests were often followed or accompanied by considerable movements of population. Sometimes the two went necessarily together, because the motive for war was the desire for richer lands on which the conquerors wished to live; sometimes the movement of population resulted from the ferocity of the invaders who drove whole populations away from the countries which they had inhabited.

#### REFUGEE MOVEMENTS

*Temporary.*—For a long period this feature of warfare disappeared, but with the World War of 1914 it once more re-appeared. The events of 1914-8 caused greater movements of population from one place to another than there had been for centuries before. In some cases, it is true, these movements,

though large, were only temporary. For example, although the Belgian refugees who fled from the German invaders in 1914 were very numerous, and although practically all of them remained away from their homes until the end of 1918, they did not attempt to create a new life or to establish new homes outside their native land; their migration was only temporary, like that of the refugees who fled from the invaded provinces of France and Italy.

*Permanent.*—But in other cases, great masses of refugees who left their homes when the tide of war swept over them had little prospect of ever returning or of recreating their previous life there. This has been the situation of a considerable proportion of the inhabitants of the Balkan Peninsula. In that unhappy region of the world, where the population of large areas is mixed in race, great masses of people were obliged, either by fear of the invading armies or by the hostility of their immediate neighbours, to fly from the places where for centuries they and their forefathers had lived, and once they had left their homes the Governments of the countries which they had abandoned made it plain that they would not allow them to return, or that if they did return they would not allow them the means of decent life. Faced, therefore, with prolonged, if not permanent exile, the refugees were forced to try to build up a new life in the country to which they had fled. This happened in one case as the result, not of international, but of civil, war. The struggle of 1917 to 1919 between the White and Red armies in Russia led to the emigration of great numbers of Russians who were subsequently scattered to every part of the world. In yet other cases the movement of population took place, not as the direct result of military action during a war, but in consequence of the terms of the treaties made when the war ended. But whether they came under about the terms of these so-called "Exchange of Population" treaties, or whether they were due to the compulsory or spontaneous flight of terror-stricken minorities while hostilities were still going on, these movements of population were due directly to the War. They all presented a number of common features, while collectively they created a great economic and political problem for the exhausted Governments of Europe. Before indicating what has been done to deal with this problem it is necessary to say a few words about its extent.

## MOVEMENTS—VARIOUS COUNTRIES

Excluding such temporary movements as those of the Belgians, the emigrations of war refugees of different nationalities were roughly as follows:—

1. *Russians.*—Between 1917 and 1920 more than 1,000,000 political refugees from Russia were thrown upon the charity of Europe. Some of these refugees were prisoners taken by the Germans and Austrians during the War, who refused to return to Russia. A great number were members of the defeated armies of Koltchak, Wrangel, Denikin and others. Many were women and children who fled from the terrors of the Bolshevik revolution. When they had time to settle down their distribution was roughly estimated as follows: Germany, 300,000; Poland, 400,000; France, 400,000; Serbia, 50,000; Bulgaria, 30,000; Czechoslovakia, 20,000; Rumania, Greece, at least 50,000; Finland, 50,000. In addition a large number—at least 100,000—fled eastwards into China.

2. *Greeks.*—As the result of warlike operations there fled into Greece between 1915 and 1922 1,250,000 Greek refugees from Asia Minor and Eastern Thrace and 50,000 from Bulgaria. In addition there came under treaties for the exchange of population from Bulgaria a further 50,000; from Asia Minor approximately 100,000.

3. *Armenians.*—From the year 1915 onwards there were expelled from their dwellings in Asia Minor more than 2,000,000 Armenians. Great numbers of them were either massacred or perished in their wanderings in the mountains; some few succeeded in making journeys on foot as far as Mesopotamia; others sought protection in the Russian Empire. In 1921 the independent Armenian Republic of Erivan, with an Armenian population of 800,000, adopted the Soviet régime and became part of the Federated Union of Socialist Soviet Republics. To its original population, 300,000 to 400,000 additional refugees from Turkish Armenia were shortly added, and in spite of their great suffering, they were absorbed with remarkable rapidity into the economic system of the country. It is further estimated that more than 300,000 other Armenians are scattered more or less in destitution over Europe, Russia and the Near East. In 1921 100,000 fled to Syria and have now become Syrian subjects in the territory under French mandate; more than

60,000 fled in the following year to Greece; 20,000 to 30,000 more fled to the Republic of Erivan.

4. *Bulgars.*—From 1918 onwards a large number of minorities of Bulgarian or quasi-Bulgarian race and language fled before the Turkish, Greek and Serbian Armies from their homes in the Dobrudja, in Macedonia and in Eastern and Western Thrace. It is calculated by the Bulgarian Govt. that their total number amounts to almost half a million. In addition, about 75,000 Bulgars have voluntarily emigrated to Bulgaria from Greece under the terms of the Greco-Bulgarian Exchange of Population Treaty.

5. *Turks.*—Approximately 50,000 Turks fled from Eastern Thrace and Smyrna when these territories were occupied by Greek forces in 1919, but returned to their homes in 1922. In addition, approximately 350,000 to 400,000 Turks were moved from Greece (most of them from Macedonia, Crete and Western Thrace) to Asia Minor under the terms of the Exchange of Population Treaty made at Lausanne in 1922.

## EFFECTS OF REFUGEE MOVEMENTS

Broadly speaking, the general features of these movements of population may be summarised as follows:—

First, the great emigration of Russian political refugees has been an almost unmixed evil both for Europe and for the refugees themselves. Their great suffering has not been compensated by any considerable political or economic gain. This is not equally true, however, of the movement of population in the Balkans and in the Near East. These movements have at least done a great deal towards the effective unmixing of the populations in these areas. The mixture of populations has led to so much political trouble in modern times that this unmixing process must be regarded as a very considerable advantage.

Further, in certain countries the influx of refugees, while at first it appeared to be a disaster, is in the long run proving to be a source of strength. This is particularly true of Greece, where, thanks to arrangements which will be mentioned shortly, the refugees were absorbed very quickly into the economic system of the country, where they have immensely increased the agricultural production and have imported industries hitherto unknown. There is no doubt that they have thus much improved the political position of Greece by giving it a homogeneous and vigorous new population and by increasing the economic wealth of the nation as a whole. It appears probable that the same result will in due course happen in Bulgaria, though there the process has been much slower, as the refugees showed less inclination to accept their exile as definitive and to settle down in new homes, than those who went from Asia Minor to Greece.

Another result of general importance which has followed the movement of population caused by the War is that Asia Minor has been left almost exclusively to the Turks. Hitherto inhabited by a very mixed population, including elements which continued the traditions of the ancient civilisation of Byzantium, there are now few of these elements left.

These changes, whether they be good or evil, have only come about at the cost of terrible suffering to all the individuals concerned. This is true even of those who have been moved under treaties of exchange, though of course their sufferings have been much less than those who fled before invaders. It is the personal aspects of refugee movements which generally dominate the minds of people when they consider refugee questions; and no doubt these personal aspects are of supreme importance, not only on account of the claim of the refugees to the humanitarian sympathy of every civilised man and woman, but also because it is the personal problems of individual refugees, which when they are taken collectively, make up the economic problems which their movements cause. And the economic problems brought upon the Governments of Europe by refugee movements since the War have been of great importance. In many countries they have seriously over-flooded the labour market, and in a number of centres the arrival of vast masses of strangers, wholly destitute and unable to find employment, threw a great burden on the financial resources of the States to which they came, whose Governments, unwilling to see them die of starvation, were literally obliged to furnish them with doles from their national funds. This part of the problem is, however, much affected by the so-called Treaties for the Exchange of Population, on which, therefore, it is necessary to say a word.

*Treaties of Exchange.*—Under these treaties, the most important of which are the Greco-Turkish and the Greco-Bulgarian, impartial committees, consisting of one representative from each government and two or three impartial experts appointed by the League of Nations, supervise or actually carry out the transportation of the persons moved from one country to the other, value their property, keep an exact record of it and establish their claim for this value against the government of the country to which they go. These treaties of exchange have worked with varying success. So far as the Greco-Turkish Treaty is concerned, its principal and most necessary effect was to make room in Greece, by the removal of 350,000 Turks, for a great part of the incoming flood of refugees, who found in the evacuated Turkish properties fields and houses ready for their use. Without this treaty of exchange, the absorption of the Greek refugees into productive employment in their motherland could never have been done. On the other hand, the fate of the Turks transported under the treaty from Greece into Turkey appears to have been less happy. Official information cannot be had, but persistent rumours allege that although there were also in Turkey many empty properties for the incoming Turks, the arrangements have been so defective as to inflict grave losses on them.

Of the Greco-Bulgarian treaty of exchange, it is enough to say that while the working of its machinery has been slow, it has already laid the foundation for an unmixing of the population in Greek Macedonia and in parts of Bulgaria, which in the long run, though at the cost of great personal suffering, is likely to lead to satisfactory results.

#### WORK OF THE LEAGUE OF NATIONS

The other personal and economic problems which have been raised by the Refugee movements above described have been dealt with partly by individual governments and partly by the League of Nations. To take the Russians first, many governments throughout Europe accorded them particular privileges and gave them much State help—in particular Serbia and Bulgaria deserve mention. The League of Nations also played a considerable part through the action of the Delegations which it established in Constantinople and in Bulgaria, Greece, Serbia, Germany, Poland, France and other countries, in breaking up the most disastrous congestions of refugees in places where no employment could be found, for example, in Constantinople and Greece; in securing for the refugees in many countries legal protection, freedom of movement in search of employment and a new form of so-called "League of Nations Passport" under which they were enabled to travel from one country to another; and even in securing for a small number who desired it, repatriation to their native land. Under the auspices and with the help of these League offices, large movements of Russian refugees were carried out to France, to the United States, to Canada and to other countries where employment could be found.

For the Greek refugees the League has done still more. Through its machinery a loan of £12,000,000 for their settlement in agricultural and other employment was obtained, and under the international control of a League Commission this settlement has been carried out with remarkable success. On June 12 1926 the council of the League of Nations announced their intention of providing a loan of £2,250,000 to the Bulgarian Government to assist the settlement of the Bulgar refugees. The conditions for administration and security were similar to those laid down in the case of the Greek refugee loan.

For the Armenians the same passport privileges and legal protection were obtained through the machinery of the League as had previously been obtained for the Russians. Their dispersal from places where they were concentrated in too great numbers, for example, from Greece, was also assisted by the agents of the League.

The effect of this League of Nations action is likely to be cumulative, and considerable as are its short period results in mitigating the sufferings of the refugees and in helping to solve the economic problems caused to the governments concerned,

its long period results are likely to be more important still. By the various kinds of action which it has undertaken, the League has helped to remove centres of disaffection and discontent; it has helped to build up the prosperity of different portions of the world; and it has helped to raise, by the distribution and settlement of industrious and highly educated refugees, the standards of civilisation in various portions of the globe. It is, therefore, possible to say that, as the result of the generosity of a number of governments and of their enlightened co-operation through the machinery of the League, the ultimate results of the Refugee movements will be better than even the most optimistic could have ventured to expect.

**BIBLIOGRAPHY.**—League of Nations Official Journal, 3rd year, Nos. 3, 4, 7, 11 and 12; 5th year, Nos. 3–12; 6th year, Nos. 2, 3, 4, 7 and 10. (F. N.)

**REGINA**, Canada (see 23.39), the capital of the province of Saskatchewan, increased its population from 2,244 in 1901 to 34,432 in 1921. The city has a large distributing trade and is the central market for an agricultural region. It is on the Canadian Pacific and Canadian National railways, and has 12 radiating lines. There are many mills, banks, wholesale houses and factories, including a large oil refinery. An annual exhibition is held in a big exhibition park. Extensive buildings for the provincial government have been erected in a park of 160 ac. on the south bank of the Wascana Lake. Regina is the western headquarters of the Royal Canadian Mounted Police.

**REHAN, ADA** (1860–1916), American actress (see 23.48), died in New York City Jan. 8 1916.

**REID, SIR GEORGE** (1841–1913), British painter (see 23.50), died at Oakhill, Somerset, Feb. 9 1913.

**REID, SIR GEORGE HOUSTON** (1845–1918), Australian politician, was born Feb. 25 1845 at Johnstone, Renfrewshire, and emigrated in 1852 to Australia. He practised as a barrister in Sydney and was elected to the N.S.W. Parliament in 1880. In 1883–4 he was minister of public instruction and from 1891–4 was leader of the Free Trade party. In 1894 he became premier and retained office until 1899. Reid played a conspicuous part in the Federation movement and was a member of the first Commonwealth Parliament of 1901, leading the Free Trade Opposition to Sir Edmund Barton. In 1904 he became Prime Minister, but he stood for a programme which was unacceptable to a predominantly Protectionist country, and after his fall in the following year he never again held office. He led the opposition from 1905–8 and in the latter year retired from Australian politics. Created K.C.M.G. in 1909, in the same year he was appointed high commissioner in London; and on the expiration of his term sat in the House of Commons as Conservative member for St. George's, Hanover Square, London, till his death Sept. 12 1918.

**REID, WHITELAW** (1837–1912), American journalist and diplomatist (see 23.52), died in London Dec. 15 1912. His last public address was delivered before the students of the University College of Wales, Aberystwyth, on Thomas Jefferson. In 1912 appeared *The Scot in America and the Ulster Scot*, and posthumously, in 1913, *American and English Studies*. See Royal Courtisoz, *The Life of Whitelaw Reid* (1921).

**REIMS**, France (see 23.53), with a population of 76,645 in 1921, as compared with 102,800 in 1906, suffered severely during the World War. The German advance of Sept. 1914 brought the enemy within eight miles of the town, which was heavily bombarded and the population sheltered in the huge subterranean wine-cellars, where dormitories were made, schools were held and a daily paper was published. In Easter week, 1917, more than 25,000 shells fell on the town and the civilian population who remained—some 17,000 persons—were evacuated. Reims was one of the objectives of the Germans in 1918, but, though they got within two miles of it, the town held out until freed by the Allied offensive in October. Reims was then in ruins; it is said that less than a hundred houses remained undamaged. The Place Royale, the Rue de Vesle, the hotel de ville, the churches of St. Rémy and St. Jacques and the archbishop's palace, were burnt out or in ruins. The cathedral had been heavily shelled, under the pretext that the towers were used as

observation posts (which was denied by the archbishop) and was gravely damaged, especially on the southwest side.

Reims in 1926 was still a long way from complete recovery, and new buildings were everywhere interspersed with ruins and open spaces. The cathedral was in process of careful restoration; as many as possible of the statues will be reassembled, and the nave roof will be strengthened with concrete. Considerable progress has been made here and on the façade, Mr. J. D. Rockefeller having given 5,000,000 fr. towards the work, but it was reckoned in 1922 that complete restoration would take some 30 years, and much of the detailed work is irreparably lost. Part of the north aisle is in use as a temporary church. The statue of St. Joan of Arc, which stood in front of the cathedral, was removed during the War for safety, and replaced in 1921; many of the art treasures, tapestries, etc., were also saved. Light railways, starting from the Gare des Promenades, have been built to various spots on the battlefields. Strong efforts have been made to rehabilitate the wool spinning industry.

**REINACH, JOSEPH** (1856–1921), French author and politician (see 23.55), died in Paris April 18 1921.

**RE-INFORCED CONCRETE:** see FERRO-CONCRETE ENGINEERING.

**REINHARDT, MAX** (1873– ), German stage and theatrical manager, was born at Baden near Vienna, Sept. 9 1873. He studied under Emil Bürde and began his theatrical career in a theatre in Salzburg. In 1894 he went to Berlin, where he was one of the founders of the Kleines Theater (1902). In 1903 he became manager of the Neues Theater and from 1905–20 was director of the Deutsches Theater, Berlin, which was connected with the Kammerspiele. He was also in 1919–20 director of the Grosses Schauspielhaus in the same city. At the Deutsches Theater, with the help of a company of excellent actors, including Wegener and Bassermann, he put into practice his ideas of a new art of the theatre. He aimed at ensemble effects and the unification of rhythm of speech, gesture, scene and background, tone, colour, costume and movement. Reinhardt achieved fame in England as the producer of *Sumurun* (1911), of *The Miracle* at Olympia, London (1911–2), and of *Oedipus Rex* (1912). In addition to his interests in Berlin, Reinhardt also owned theatres in Vienna and Salzburg.

**RÉJANE, GABRIELLE** (1857–1920), French actress (see 23.58), died in Paris June 14 1920. During the World War she visited England and acted in patriotic plays in London. She was made chevalier of the Legion of Honour for her War services.

**REJUVENATION.**—Post-mortem examinations of many hundreds of cases where great age has been attained reveal invariably the same histological changes, diminution and atrophy of the functional cells, augmentation and hypertrophy of the tissue cells and of the fibrous tissues. Physiological equilibrium is lost, energy disappears, and the cellular activity is no longer adequate for the maintenance of life.

In *Vivre*, published in 1920, (an hypothesis was put forward which is in accordance with the views expressed by Metchnikov, by which "conjunctive tissue forms a support of scaffold work for the functional cells of all organs in which are found epithelial cells, which are cells specialised to the work of the respective organs. The conjunctive tissue provides the organs with the plasma they need as nourishment, which it in turn gets from the capillary system by osmosis. Their work is purely passive, they are less fragile, and retain at all stages their power of regeneration, while the highly specialised functional cells wear out more quickly and lose their power of recuperation. There comes a time when the conjunctive cells which are still energetically reproductive come into contact with functional cells which have lost their power and are doomed to atrophy. The conjunctive cells are naturally incapable of discharging specialised functions, so that the organism becomes progressively weaker till the functional cells fail to assure vital equilibrium, and in this contest after valuable collaboration the epithelial cells are worsted by elements which are less perfected, and are unable to secure the due functioning of the several organs of the body, so that old age and death ensue. Not only do the functional cells diminish while the conjunctive cells increase, but they also undergo a regressive evolution."

In all multicellular animals the process of regeneration, growth and rejuvenation is constant as is shown typically by the hair and nails. It is now possible to cultivate tissues in suitable media (see TISSUE CULTURE) and to keep them alive long

after the death of the parent organism. This proves that death is not the inevitable end of cellular vitality, but is in every case the result of unfavourable conditions to which the cells are subjected at a given moment. Obviously, scrupulous attention to personal hygiene can do much to secure favourable conditions for the activity of the organs, but it cannot struggle with success against the regressive evolution of the cells which is brought about by old age (see DEATH).

The endocrine glands produce substances (hormones), which they pour into the circulatory system and thereby influence the metabolic processes, the growth and morphology of the cells. One of these glands should have as its special function the secretion of a substance which gives tone and stimulus to cellular vitality during a certain period of life and ceases to do this on the approach of old age. This cannot be the special function of either the thyroid, parathyroid, pituitary or suprarenal glands, since they continue to act during old age. The only gland which constitutes an exception to this rule is the genital gland. It plays a double rôle. It secretes spermatozoa externally, and it secretes internally hormones which it passes into the blood stream, actively at puberty and during maturity, but less and less thereafter, so that the diminution and disappearance of its activity correspond with old age.

Examination of male vertebrate animals after removal of the genital glands shows distinctly the nature of the influence of the internal secretion of these glands on the whole organism as affecting, not only the secondary male sexual characters, but also the growth and development of the body as a whole, the brain and skin cells, the bones and tissues. The physical and intellectual qualities of animals and of man are as intimately conditioned by the hormone secreted by the testicles as are the secondary sexual characters:

*Characteristics of Eunuchs.*—Personal observation of a number of eunuchs in Egypt shows that their cranial capacity is below normal, their intelligence is less than the average and sluggish, the memory is weak. They are prone to subterfuge, always a mark, as Dr. Dartigues has shown, of mental weakness. As to eunuchs who have played a conspicuous part in history, in diplomacy, and in war, they were men reduced to that state not in infancy but after attaining maturity, so that the hormone secretion would have operated on their mental development.<sup>1</sup>

The skeleton is affected by the removal of the testicles and their harmonic activity. The long bones, such as the tibia and femur, ossify much more slowly, and eunuchs are taller than the average of their race. The cranium is reduced in size. The face is narrower and all the bones more fragile. The shoulder blades are slender and the pelvis enlarged. The cartilages of the larynx do not ossify, and retain their infantile structure. The Adam's apple does not project as is usual. Clearly the removal of the testicles before the completion of bodily growth modifies the whole bony structure, and proves the preponderating influence of the testicular hormone on the architecture of the skeleton.

The effect of these hormones on the metabolism of the body, the chemical transformation of substances assimilated by the organism, is also general, since, as Marignan has shown, the glycogen content of "entires" is greater than that of animals which have been castrated. Reduction of muscular development is accompanied by an increase of adipose tissue, which is spread over the whole body but is specially marked in the mammary region, the abdomen and the buttocks. The skin is affected by castration; eunuchs have a pale tint, and their hair goes at an early age.

There can thus be no doubt as to the nature of the relation between the general reduction of the forces of the organism and the disappearance of the internal secretion of the testicles. No organ can keep its vital energy and yield a full return if the cells are not stimulated and vivified by the testicular hormone. It acts more or less directly on other endocrine glands, since castration is followed by hypertrophy of the anterior lobe of the pituitary gland and by regression of the thyroid body and epiphysis. If the genital glands remained active in old age, were

<sup>1</sup> *Rejuvenation by Grafting*, Serge Voronoff.

they not the only glands which cease to secrete hormones, old age would certainly be delayed.

Eunuchs in Cairo who had been castrated at an early age and had therefore never been exposed to the activity of the testicular hormones, were never known to have been more than 60 at death. All had the appearance of old men, with desiccated skins, haggard eyes, bent, and looking like centenarians. They die between 50 and 60, prematurely old, long before the term normally reached by their fellows.

It is obvious that the deprivation of the internal secretion of the testicles accelerates the advance of old age and shortens life. The only remedy is to graft a young testicle, whether that of a young human being or of an ape; by which the tone-giving substance is provided, so as to increase the vitality of all the cells which are weakened but are not yet atrophied and therefore still able to renew themselves, and thus effectively to rejuvenate the whole organism. So long as an organism, however old, continues to exist, its cells continue to be renewed and rejuvenated. Unfortunately, in old age this process of rejuvenation is slowed down, a certain number of the functional cells regress and are replaced by conjunctive tissue. Not every cell is atrophied. Were this to happen life would stop. The cells which escape this are renewed more slowly, but continue to be renewed to the extreme limit of their vitality.

With a rich addition of the testicular hormone, the cells acquire new energy, grow more rapidly, proliferate more intensely and rejuvenate the whole system. At the end of several years the beneficent action of the grafted gland is exhausted because the grafts in turn are subject to positive regression. The organism is again deprived of the stimulating hormones and the symptoms of old age reappear. In most cases testicular grafting is adequate, but in some cases thyroid grafts have to be added, as stated in *Vivre*. See S. Voronoff, *Rejuvenation by Grafting* (1925).

(S. V.)

**RELATIVITY.**—The progress of physical science during the first quarter of the present century was specially remarkable for the general acceptance by the scientific world of the principle of relativity, as expounded by Prof. Albert Einstein, professor of physics in the Kaiser Wilhelm Institut, Berlin. Its meaning and its history as part of present-day physical theory are the object of this discussion.

*Introduction.*—The primary aim of the investigator in pure science is the discovery of natural laws. As a secondary and hardly less important aim, he tries to invent a mechanism which shall account for the laws already known. The secondary aim is forced upon him partly by the constitution of the human mind; our intellects, unsatisfied with a mere accumulation of facts, impel us ever to search for the causes underlying the facts: *Vere scire est per causas scire*. But to the working scientist the discovery of a mechanism has an additional and more practical value. When he has found a mechanism which will account for certain laws, he can proceed to examine the complete set of laws which the mechanism demands. If his mechanism corresponds with sufficient closeness to reality he may in this way be led to the discovery of new natural laws. On the other hand, the new laws deduced from the supposed mechanism may be false. If the falsity of the new laws is not at once revealed science may for a time be led into wrong paths. When more accurate experimenting or observation discloses that the laws are not true a recasting of ideas becomes necessary, and the branch of science concerned may experience a time of revolution followed by a period of rapid growth.

An obvious illustration of these general statements is provided by the history of astronomy. The laws of the motions of the planets, as observed from the earth, were tolerably well known to the Greeks. They had also evolved an explanatory mechanism starting from the metaphysical premise that the paths of the planets must necessarily be circles. The earth was the centre of the universe and round this revolved spheres to which the planets were attached. To explain the retrograde motion of the outer planets, these were supposed attached to secondary spheres revolving about points on the primary spheres which in

turn revolved about the earth. This mechanism of cycles and epicycles as an explanation of planetary motion held the field for eighteen centuries. Finally the observations of Tycho Brahe provided a test which revealed the falsity of the whole structure. The position of Mars was found to differ from that required by the mechanism of epicycles by an amount as great as eight minutes of arc. "Out of these eight minutes," said Kepler, "we will construct a new theory that will explain the motions of all the planets."

The history of the succeeding century of astronomy need not be recapitulated here (see 2.811). The earth yielded its place as the centre of the universe, and the structure of cycles and epicycles crumbled away. The laws of planetary motion were determined with a precision which for the time appeared to be final. The mechanism underlying these laws was supposed to be a "force" of gravitation. This force was supposed to act between every pair of particles in the universe, its intensity varying directly as the product of the masses of the particles and inversely as the square of the distance separating them—the famous law of Newton.

In science, history repeats itself. Recent years have provided a further instance of the general processes we have been considering. Under the Newtonian mechanism every planet would describe a perfect ellipse about the sun as focus, and these elliptic orbits would repeat themselves indefinitely except in so far as they were disturbed by the gravitational forces arising from the other planets. But, after allowing for these disturbing influences, Leverrier found that the orbit of the planet Mercury was rotating in its own plane at the rate of 43 seconds a century. Various attempts have been made to reconcile this observed motion with the Newtonian mechanism. The gravitational forces arising from the known planets were demonstrably unable to produce the motion in question, but it was possible that Mercury's orbit was being disturbed by matter so far unknown to us.

Investigations were made as to the disturbance to be expected from various hypothetical gravitating masses—a planet or a ring of planets between Mercury and the sun, a ring of planets outside the orbit of Mercury, a belt of matter extended in a flattened disc in a plane through the sun's centre, an oblateness greater than that suggested by the shape of the sun's surface, in the arrangement of the internal layers of the sun's mass. In every case the mass required to produce the observed disturbance in the motion of Mercury would have also produced disturbances not observed in the motions of the other planets. The solution of the problem came only with the theory of relativity. Just as Tycho's eight minutes of arc, in the hands of Kepler and Newton, revolutionised mediaeval conceptions of the mechanism of the universe, so Leverrier's 43 seconds of arc, in the hands of Einstein, has revolutionised our 19th-century conceptions, not only of purely astronomical mechanism, but also of the nature of time and space and of the fundamental ideas of science. The history of this revolution is in effect the history of the theory of relativity. It falls naturally into two chapters, the first narrating the building of an earlier physical theory of relativity, and the second dealing with the extension of that theory to gravitation.

*The Physical Theory of Relativity.*—The earliest successful attempt to formulate the laws governing the general motion of matter is found in Newton's laws. The first law states that:—

*Every body perseveres in its state of rest or of uniform motion in a right line unless it is compelled to change that state by forces impressed thereon.*

In this law no distinction is made between rest and uniform motion in a straight line, and the same is true of the remaining laws. Hence follows the remarkable property to which Newton draws explicit attention in his fifth corollary to the laws of motion:—

*The motions of bodies included in a given space are the same among themselves, whether that space is at rest, or moves uniformly forwards in a right line without any circular motion.*

As a concrete application of this principle, Newton instances "the experiment of a ship, where all motions happen after the

same manner whether the ship is at rest or is carried uniformly forward in a right line." Just as a passenger on a ship in a still sea could not determine, from the behaviour of bodies inside the ship, whether the ship was at rest or moving uniformly forward, so we cannot determine from the behaviour of bodies on our earth whether the earth is at rest or not. We believe the earth to be moving round the sun with a speed of about 30 km. a second, so that there can be no question of the earth being permanently at rest, but we are unable to determine whether it is at rest at any specified point of its orbit, or, in the probable event of its not being at rest, what its absolute velocity may be. There is no more reason for thinking the sun, than the earth, to be at rest. Newton wrote as follows:—

It is possible that in the remote regions of the fixed stars, or perhaps far beyond them, there may be some body absolutely at rest, but impossible to know, from the positions of bodies to one another in our regions, whether any of these do keep the same position to that remote body. It follows that absolute rest cannot be determined from the position of bodies in our regions.

The above quotations are all from the first book of the *Principia Mathematica*. Previous to them all Newton writes: "I have no regard in this place to a medium, if any such there is, that freely pervades the interstices between the parts of bodies." The two centuries which elapsed after the publication of the *Principia* witnessed a steady growth of the belief in the reality of such an all-pervading medium. It was called the aether, and by the end of these two centuries (1887) it was almost universally believed that light and all electromagnetic phenomena were evidence of actions taking place in this aether. Light from the most distant stars was supposed to be transmitted to us in the form of wave motions in the aether, and we could see the stars only because the sea of aether between us and these stars was unbroken. It had been proved that if this sea of aether existed it must be at rest, for the alternative hypothesis that the aether was dragged about by ponderable bodies in their motions had been shown to be incompatible with the observed phenomenon of astronomical aberration and other facts of nature (see 1.292). On this view it was no longer necessary to go to Newton's "remote regions of the fixed stars, or perhaps far beyond them," to find absolute rest. A standard of absolute rest was provided by the aether which filled our laboratories and pervaded all bodies. Owing to our motion it would appear to be rushing past us, although without encountering any hindrance—"like the wind through a grove of trees," to borrow the simile of Thomas Young. The determination of the absolute velocity of the earth was reduced to the problem of measuring the velocity of an aether current flowing past us and through us.

In this same year (1887) the first experimental determination of this velocity was attempted by the Chicago physicist A. A. Michelson. The velocity of light was known to be, in round numbers, 300,000 km. a second, a velocity which was believed to represent the rate of progress of wave motion through the aether. If the earth were moving through the aether with a velocity of 1,000 km. a second, the velocity of light relative to a terrestrial observer ought to be only 299,000 km. a second when the light was sent in exactly the direction of the earth's motion through the aether, but would be 301,000 km. a second if the light was sent in the opposite direction. In more general terms, if the earth were moving through the aether, the velocity of light, as measured by a terrestrial observer, would depend on the direction of the light, and the extent of this dependence would give a measure of the earth's velocity. The velocity of light along a single straight course does not permit of direct experimental determination, but the same property of dependence on direction ought to be true, although to a less extent, of the average to-and-fro velocity of a beam of light sent along any path and then reflected back along the same path.

It was through this property that Michelson attempted to measure the earth's velocity through the aether.

The apparatus was simple in principle. A circular table ABCD (cf. fig. 1) was arranged so as to be capable of slow rotation about its centre O. Light sent along CO was divided up at O into two beams which were made to travel along perpendicular radii OA, OB. The

arms OA, OB were made as equal as possible and mirrors were placed at A and B to reflect the beams of light back to O. An extremely sensitive optical method made it possible to detect even a very slight difference in the times of the total paths of the two beams from O back to O. There would in any case be a difference owing to the necessarily imperfect equalisation of the lengths of the arms OA, OB, but if the earth is moving through the aether in some direction OP, and if the table is made to rotate slowly about O, then this difference ought itself to vary on account of the earth's motion through the aether. Michelson, and afterwards Michelson and Morley in collaboration, attempted to estimate the amount of this variation. No variation whatsoever could be detected, although their final apparatus was so sensitive that the variation produced by a velocity through the aether of even 1 km. a second ought to have shown itself quite clearly.

Thus to the question "What is our velocity through the aether?" Nature appeared to give the answer "None." It was never suggested that this answer should be accepted as final; it would have brought us back to a geocentric universe. Clearly either the question had been wrongly framed or the answer wrongly interpreted. It was pointed out in 1893 by Fitzgerald, and again independently, in 1895, by Lorentz, that the *null* result of the Michelson-Morley experiment could be explained if it could be supposed that motion through the aether altered the linear dimensions of bodies.

FIG. 1.

FIG. 2.

To be explicit, it was found that the experiment would invariably and of necessity give a *null* result if it was supposed that every body moving through the aether with a velocity  $u$  was contracted

in the direction of its motion in the ratio  $\sqrt{1 - \frac{u^2}{c^2}}$ ,  $c$  being the

velocity of light. The supposition that such a contraction occurred was not only permissible—it was almost demanded by electrical theory. For Lorentz had already shown that if matter were a purely electrical structure, the constituent parts would of necessity readjust their relative positions when set in motion through the aether and the final position of equilibrium would be one showing precisely the contraction just mentioned.

On this view, there was no *prima-facie* necessity to abandon the attempt to measure the earth's velocity through the aether. The answer to the problem had merely been pushed one stage farther back, and it now became necessary only to measure the shrinkage of matter produced by motion. It was obvious from the first that no direct material measurement could disclose the amount of this shrinkage, since any measuring rod would shrink in exactly the same ratio as the length to be measured; but optical and electrical methods appeared to be available. Experiments to this end were devised and performed by Rayleigh, Brace, Trouton and Noble, Trouton and Rankine and others. In every case a *null* result was obtained. It appeared then that if the earth moved through the aether this motion was concealed by a universal shrinkage of matter, and this shrinkage was in turn concealed by some other agency or agencies.

At this time the word "conspiracy" found its way into the technical language of science. There was supposed to be a conspiracy on the part of the various agencies of nature to prevent man from measuring his velocity of motion in space. If this motion produced a direct effect  $x$  on any phenomenon, the other agencies of nature seemed to be in league to produce a countervailing effect  $-x$ . A long train of experiments had not revealed, as was intended, our velocity through the aether; they had merely created a conviction that it was beyond the power of man to measure this velocity. The conspiracy, if such there was, appeared to have been perfectly organised.

A perfectly organised conspiracy of this kind differs only in name from a law of nature. To the inventor who tries to devise a perpetual-motion machine it may well appear that the forces of nature have joined in a conspiracy to prevent his machine from working, but wider knowledge shows that he is in conflict not with a conspiracy, but with a law of nature—the conservation of energy. In 1905 Einstein, crystallizing an idea which must have been vaguely present in many minds, propounded the hypothesis that the apparent conspiracy might be in effect a law of nature. He suggested, tentatively, that there might be a true law to the effect that “it is of necessity impossible to determine absolute motion by any experiment whatever.” This hypothetical law may again be put in the equivalent form: “The phenomena of nature will be the same to two observers who move with any uniform velocity whatever relative to one another.” This may be called the hypothesis of relativity.

The hypothesis in itself was not of a sensational character. Indeed, from the quotations which have already been given from Newton's works, it appears probable that Newton himself would have accepted the hypothesis without hesitation: he might even have regarded it as superfluous. The true significance of the hypothesis can only be understood by a reference to the scientific history of the two centuries which had elapsed since Newton. The Newtonian view that absolute rest was to be found only “in the remote regions of the fixed stars, or perhaps far beyond them,” had given place to a belief that absolute rest was to be found all around us in an aether which permeated all bodies. What was striking about the hypothesis was its implication—either that we could not measure the velocity relative to ourselves of a medium which surrounded us on all sides, or else that no such medium existed.

The hypothesis demanded detailed and exhaustive examination. It was for the mathematician to test whether the hypothesis was in opposition to known and established laws of physics, and to this task Einstein, Lorentz and others set themselves. If a single firmly established law proved to be in opposition to the hypothesis, then of course the hypothesis would require to be abandoned. It was unlikely that such an event would occur among the well-established laws, for if it did, the phenomena governed by that law would enable direct measurement to be made of the earth's velocity through the aether, a measurement which had so far eluded all attempts of experimenters. It was among the more obscure and less well-established laws, if anywhere, that discrepancies were to be looked for.

It is impossible here to give a complete account of the many tests to which the relativity hypothesis has been subjected. The result of all can be summed up in one concise and quite general statement:—Wherever the hypothesis of relativity has appeared to be in conflict with known or suspected natural laws further experiment, where possible, has without a single exception shown the laws to be erroneous, and has moreover shown the alternative laws suggested by the hypothesis of relativity to be accurate. It is only in somewhat exceptional cases that the hypothesis of relativity of itself suffices to determine fully the form of a natural law; these cases constitute the most striking triumphs of the theory. As instances may be mentioned the determination of the law connecting the mass of an electron with its velocity; of the law expressing the velocity of light through a transparent medium in motion (Fizeau's water-tube experiment); and of the formulae for the magnetic forces on moving dielectric media (experiments of Eichenwald and H. A. Wilson).<sup>1</sup>

Before passing on from the general statement which has been made, particular mention must be made of one special case. A natural law which, at an early stage, was seen to be in conflict with the hypothesis of relativity was Newton's famous law of gravitation—namely, that every particle of matter attracts every other particle with a force proportional to the product of the two masses, and to the inverse square of their distance apart.

<sup>1</sup> For references to the original papers dealing with these and other tests of the hypothesis of relativity see Cunningham, *The Principle of Relativity*, or J. H. Jeans, *Mathematical Theory of Electricity and Magnetism* (4th or 5th ed.).

Either, then, Newton's great law had to be abandoned, or else the hypothesis of relativity had to be discarded, in which case it would immediately become possible, in theory at least, to determine the earth's velocity through space by gravitational means. It is the choice between these two alternatives that has led to the most surprising developments of the theory of relativity; and to these we shall return later.

*Space and Time.*—The hypothesis of relativity, as has already been explained, postulates that the phenomena of nature will be the same to any two observers who move relative to one another with any uniform velocity whatever. The hypothesis has been so amply tested as regards all optical and electromagnetic phenomena that no doubt is felt, or can rationally be felt, as to its truth with respect to these phenomena. The hypothesis can be examined and developed in two opposite directions. We may, on the one hand, proceed from the general hypothesis to the detailed laws implied in it; this has already been done, with completely satisfactory results as regards confirmation of the hypothesis. Or we may regard the hypothesis of relativity as being itself a detailed law, and attempt to generalise upward to something still wider. It is this possibility which must for the moment claim our attention.

In 1905 Einstein examined in full the consequences of the hypothesis that one simple optical phenomenon—namely, the transmission of a ray of light in free space—was, in accordance with the hypothesis of relativity, independent of the velocity of the observer. If an aether existed, and provided a fixed framework of reference, then light set free at any instant would obviously travel with a velocity which would appear to an observer at rest in this aether to be the same in all directions, and the wave front at any instant would be a sphere having the observer as centre. On the hypothesis of relativity the phenomenon of light transmission must remain unaffected by the motion of the observer so that the light must appear, to a moving observer also, to travel with a uniform velocity in all directions, and thus to the moving observer also the wave front must appear to be a sphere of which he will be the centre. It is, however, quite obvious that the same spherical wave front cannot appear, to each of two observers who have moved some distance apart, to be centred round himself, unless the use either of the common conceptions of science or of the ordinary words of language is greatly changed. In fig. 2 it is not possible, in ordinary language, that both O and P should at the same instant be at the centre of the sphere A B C. The change to which Einstein was forced is one which has an intimate bearing upon our fundamental conceptions of the nature of space and time; this change it will be necessary to explain in some detail.

Suppose that two observatories, say Greenwich and Paris, wish to synchronise their clocks, with a view to, let us say, an exact determination of their longitude difference. Paris will send out a wireless signal at exact midnight as shown by the Paris clock, and Greenwich will note the time shown by the Greenwich clock at the instant of receipt of the signal. Greenwich will not, however, adjust their clock so as to show exact midnight when the signal is received; a correction of about 0.01 second must be made to allow for the time occupied by the signal in traversing the distance from Paris to Greenwich. To turn to mathematical symbols, if  $t_0$  is the time at which a signal is sent out from one station, the time of receipt at a second station is taken to be  $t_0 + \frac{x}{c}$ , where  $x$  is their distance apart, and

$c$  is the velocity of light. This represents the ordinary practice of astronomers, but it is clear that if the earth is travelling through a fixed aether with a velocity  $u$  in the direction of the line joining the two observatories, the velocity of transmission of the signal relative to the two observatories will not be  $c$  but  $c+u$ , and the time of receipt at the second station will be  $t_0 + \frac{x}{c+u}$ .

Thus it appears that it is impossible to synchronise two clocks unless we know the value of  $u$ , and that the ordinary practice of astronomers will not, as they expect, synchronise their clocks,

but set them at an interval apart equal to

$$x\left(\frac{1}{c}-\frac{1}{c+u}\right)$$

which may, to an approximation, be put equal to  $\frac{ux}{c^2}$ .

According to the hypothesis of relativity, it is impossible ever to determine the value of  $u$ , and so it is impossible ever truly to synchronise two clocks. Moreover, according to this hypothesis, the phenomena of nature go on just the same whatever the value of  $u$ , so that the want of synchrony cannot in any way show itself—in fact, if it did, it would immediately become possible to measure the effect and so arrange for true synchrony.

As the earth moves in its orbit, the value of  $u$  changes, so that its value in the spring, for instance, will be different from its value in the autumn. One pair of astronomers may attempt to synchronise a pair of clocks in the spring, but their synchronisation will appear faulty to a second pair who repeat the determination in the autumn. There will, so to speak, be one synchrony for the spring and another for the autumn, and neither pair of astronomers will be able to claim that their results are more accurate than those of their colleagues. More generally we may say that different conceptions of synchrony will correspond to different velocities of translation.

These elementary considerations bring us to the heart of the problem which we illustrated diagrammatically in fig. 2. The observer at O in the diagram will have one conception of simultaneity, while the second observer who moves from O to P will, on account of his different velocity, have a different conception of simultaneity. The instants at which the wave front of the light signal from O reaches the points A, B, C in the diagram will be deemed to be simultaneous by the observer who remains at O, but the observer who moves from O to P will quite unconsciously have different ideas as to simultaneity. At instants which he regards as simultaneous the wave front will have some form other than that of the sphere ABC surrounding O. If the hypothesis of relativity is to be true in its application to the transmission of light signals, this wave front must be a sphere having P as its centre. Einstein examined mathematically the conditions that this should be possible. A precise statement of his conclusions can only be given in mathematical language.

The observer who is supposed to remain at O in fig. 2 may be supposed to make exact observations and to record these observations in mathematical terms. To fix the positions of points in space he will map out a "frame of reference" consisting of three orthogonal axes, and use Cartesian co-ordinates  $x, y, z$ , to specify the projections along these axes of the radius from the origin to any given point. He will also use a time co-ordinate  $t$  which may be supposed to specify the time which has lapsed since a given instant, as measured by a clock in his possession. Any observations he may make on the transmission of light signals can be recorded in the form of equations between the four co-ordinates  $x, y, z, t$ . For instance, the circumstance that light travels from the origin with the same velocity  $c$  in all directions will be expressed by the equation (of the wave front):—

$$x^2 + y^2 + z^2 - c^2 t^2 = 0 \quad (1)$$

The second observer who moves from O to P will also construct a frame of reference, and we can simplify the problem by supposing that his axes are parallel to those already selected by the first observer. His co-ordinates, to distinguish them from those used by the first observer, may be denoted by the accented letters  $x', y', z', t'$ . If his observations also are to show light always to travel with the same velocity  $c$  in all directions, the equation of the wave front, as observed by him, must be:—

$$x'^2 + y'^2 + z'^2 - c^2 t'^2 = 0 \quad (2)$$

A 19th-century mathematician would have insisted that  $x, y, z, t$  must be connected with  $x', y', z', t'$  by the simple relations:—

$$\left. \begin{aligned} x' &= x - ut \\ y' &= y \\ z' &= z \\ t' &= t \end{aligned} \right\} \quad (A)$$

but it is obvious that if these relations hold, then equation (1) cannot transform into equation (2). Einstein finds that equation (1) will transform into equation (2) provided the co-ordinates  $x, y, z, t$  of the first observer are connected with the co-ordinates  $x', y', z', t'$  of the second observer by the equations:—

$$\left. \begin{aligned} x' &= \beta (x - ut) \\ y' &= y \\ z' &= z \\ t' &= \beta \left( t - \frac{ux}{c^2} \right) \end{aligned} \right\} \quad (B)$$

where  $\beta$  stands for  $\left(1 - \frac{u^2}{c^2}\right)^{-\frac{1}{2}}$

To form some idea of the physical meaning of these equations, it will be advantageous to consider the simple case in which the first observer is at rest in the aether while the second moves through the aether with velocity  $u$ . The points of difference between equations (B) and (A) then admit of simple explanation. The factor  $\beta$  in the first of equations (B) is simply, according to the suggestion of Fitzgerald and Lorentz already mentioned, the factor according to which all lengths parallel to the axis of  $x$  must be adjusted on account of motion through the aether with velocity  $u$ . The moving observer must correct his lengths by this factor, and he must correct his times by the same factor in order that the velocity of propagation of light along the axis of  $x$  may still have the same velocity  $c$ ; this explains the presence of the multiplier  $\beta$  in the last of equations (B). The one remaining difference between the two sets of equations, namely, the

replacement of  $t$  in (A) by  $t - \frac{ux}{c^2}$  in (B), represents exactly the want of synchrony which, as we have already seen, is to be expected in the observations of two observers whose velocity differs by a velocity  $u$ .

Although the equations admit of simple illustration by considering the case in which one observer is at rest in a supposed aether, it will be understood that the equations are more general than the illustration. They are in no way concerned with the possibility of an observer being at rest in an aether, or indeed the existence of an aether at all. Their general interpretation is this: If one observer O, having any motion whatever, finds, as a matter of observation, that light for him travels uniformly in all directions with a constant velocity  $c$ , then a second observer P, moving relative to O with a constant velocity  $u$  along the axis of  $x$ , will find, as a matter of observation, that light, for him also, travels uniformly in all directions with the same constant velocity  $c$ , provided he uses, for his observations, co-ordinates which are connected with the co-ordinates of O by equations (B).

This is the meaning that was attached to the equations by Einstein in 1905, but the equations had been familiar to mathematicians before this date. They had in fact been discovered by Lorentz in 1895 as expressing the condition that all electromagnetic phenomena, including of course the propagation of light, should be the same for an observer moving through the aether with velocity  $u$  as for an observer at rest in the aether. For this reason the transformation of co-ordinates specified by these equations is universally spoken of as a "Lorentz transformation." What Einstein introduced in 1905 was not a new system of equations but a new interpretation of old equations. The two observers who used the co-ordinates  $x, y, z, t$  and  $x', y', z', t'$  had been regarded by Lorentz as being one at rest in an aether and one in motion with a velocity  $u$ ; for Einstein they were observers moving with any velocities whatever subject to their relative velocity being  $u$ . Lorentz had regarded  $t$  as the true time and  $t'$  as an artificial time. If the observer could be persuaded to measure time in this artificial way, setting his clocks wrong to begin with and then making them gain or lose permanently, the effect of his supposed artificiality would just counter-balance the effects of his motion through the aether. With Einstein came the conception that both times,  $t$  and  $t'$ , had precisely equal rights to be regarded as true time. The measure

$t$  is precisely that which would be adopted naturally by any set of observers, or race of men, who disregarded their steady motion through space; their adoption of it would be above criticism if, as Einstein suggested, their motion through space had no influence on material phenomena, and it represents, as we have seen, the usual practice of astronomers in comparing time at different places. From this point of view neither measure of time is more accurate or more logical than the other. There are as many ways of measuring time as there are observers, and all are right.

The investigator who is trying to discover laws of nature will, in general, require to measure either directly or indirectly both time and space. If, to take a simple case, he is studying the motion of a single particle, he will measure out the position of the particle at definite instants as determined by his clock. He may specify the position of the particle at any instant by three measurements in space—for instance, he may say that two seconds after his particle started it was 6 ft. to the E. of the point from which it started, 9 ft. to the N. and 12 ft. vertically upward. The mathematician would express this by taking axes  $x, y, z$  to the E., to the N. and vertically upwards, and saying that at time  $t=2$  the particle had co-ordinates  $x=6, y=9, z=12$ . Or he might, putting his time co-ordinate  $t$  on the same footing as the space co-ordinates  $x, y, z$ , simply say that  $x=6, y=9, z=12, t=2$  represented one position of the particle. A complete set of readings of this type, each consisting of values of four co-ordinates, would give the complete history of the motion of the particle.

Such sets of simultaneous measurements form the common material of investigations in both pure and applied science. For instance, the engineer may measure the extension of a sample of steel corresponding to different loads; the electrician may measure the amount of light given by an electric filament corresponding to different amounts of current passed through it. In each of these cases there are only two quantities to be measured simultaneously, and an investigator can conveniently represent the result of the whole series of his measurements in graphical form; a single reading is represented by a point whose distances from two fixed perpendicular lines represent the quantities measured, and the curve obtained by joining these single points will give all the information contained in the whole set of readings.

We have seen that, in studying the motion of a particle in space, four sets of quantities must be measured, so that the results obtained cannot be plotted graphically on a piece of paper. Their proper representation demands a four-dimensional space, in which  $x, y, z$  and  $t$  are taken as co-ordinates. The practical importance of such graphical representation is *nil*, since it is impossible to construct a four-dimensional graph, but its theoretical importance to the theory of relativity is immense. For if the hypothesis of relativity is true, then the four-dimensional graphs of any natural event constructed by all observers, no matter what their relative motions, will be identical. The influence of their motion will be shown only in that the axes of  $x, y, z$  and  $t$  will be different for different observers, and the relations between these sets of axes will be those given by the foregoing equations (B).

The importance of this conception can hardly be overestimated, and it may be well to consider it further with the help of an illustrative example. Imagine a number of aeroplanes flying over England, and in order to eliminate one of the three directions in space—the vertical—let us limit them to fly always at the same height, say 1,000 ft. above sea-level. Imagine a number of similar plates of glass prepared, each marked faintly with an outline map of England and with lines of latitude and longitude. Suppose that at 12 h. o m. G.M.T. a plate is taken and the position of each aeroplane marked by a thick black dot. At 12 h. 1 m. let a second plate be taken and similarly marked, and let this be done every minute for an hour. The 60 plates so marked will constitute a record of the motion of each aeroplane within this hour. If, now, we place the plates in order, one above the other, on a horizontal table, the mass of glass so formed will

present a graphical representation, in three dimensions, of the motions of all the aeroplanes. In this graph the two horizontal co-ordinates represent motions in any two rectangular directions over England, say E. and N., while the third co-ordinate—the vertical—represents time. The individual black dots which represent the positions of any one aeroplane will form a dotted curve, and this curve gives a graphical representation of the motion of the particular aeroplane. Our rectangle of glass contains the history, for one hour, of all the aeroplanes in graphical form.

To represent the motion of particles in the whole world of space a four-dimensional graph is required. The four-dimensional space in which it is constructed may, following the usual terminology, be spoken of as a four-dimensional continuum. The history of any particle in the universe—just as that of any aeroplane flying over England—will be represented by a continuous line in the continuum, and this is called the “world line” of the particle. If the hypothesis of relativity is true the same continuum and the same world lines will represent the history of the particles of the universe equally well for all observers, the influence of their motions being shown only through their choosing different axes in the continuum for their axes of space and time. Thus the continuum must be thought of as something real and objective, but the choice of axes is subjective and will vary with the observer, the relation between different choices being expressed mathematically by our equations (B), the equations of the Lorentz transformation. An inspection of these equations shows that the sets of axes chosen by different observers have different orientations in the continuum, so that what one observer describes as a pure space interval will appear to another to be a mixture of time and space.

The instant of time and point in space at which any event occurs can be fixed by a single point in the continuum, so that the interval between two events will be represented by a finite line. The events and the interval between them are absolute, but the interval will be split up into time and space in different ways by different observers. The interval between any two events, such as the great fire of London and the outburst on the star Nova Persei, may be measured by one set of observers as so many years and so many millions of miles, but another set of observers may divide the interval quite differently. For instance a terrestrial astronomer may reckon that the outburst on Nova Persei occurred a century before the great fire of London, but an astronomer on the Nova may reckon with equal accuracy that the great fire occurred a century before the outburst on the Nova. A third astronomer may insist that the events were simultaneous. All will be equally right, although none will be right in an absolute sense. At this stage we may notice one respect in which our pile of glass plates failed to represent the true continuum. The mass of glass was stratified into different plates which represent different times for one particular observer. To obtain a section which would represent what an observer in motion relative to this first observer could regard as simultaneous positions of the aeroplanes, we should have to cut the mass of glass on the slant. The continuum is more closely represented by our plates of glass if they are annealed into a solid mass from which all trace of the original stratification is made to disappear. All observers, no matter what their motion, are then equally free to cut a section to represent their individual ideas of simultaneity.

Thus space and time fade into subjective conceptions, just as subjective as right hand or left hand, front and behind, are in ordinary life. The continuum alone is objective and may be thought of as containing an objective record of the motion of every particle of the universe. The curve in which this record is embodied is spoken of as the world line of the particle in question. To use the words of Minkowski: “Space in itself and time in itself sink to mere shadows, and only a kind of union of the two retains an independent existence.”

*Gravitation and Relativity.*—Since all the phenomena of light and of electromagnetism are believed, on almost incontrovertible evidence, to be in accordance with the hypothesis of relativity,

it is necessarily impossible to determine absolute velocity by optical or gravitational means. On the other hand, as we have already mentioned, the Newtonian law of gravitation is readily seen to be inconsistent with the hypothesis of relativity. Three alternatives are open:—

(i.) The Newtonian law may be true, in which case it must be possible to determine absolute velocity by gravitational means.

(ii.) The Newtonian law may be untrue in its original form, but may become true when amended so as to conform to the relativity hypothesis.

(iii.) Neither of the foregoing possibilities may be true.

Alternative (i.) was explored by Sir Oliver Lodge, who, assuming the exact truth of the Newtonian law of gravitation, deduced that the observed motion of the perihelion of Mercury could be accounted for if the sun were moving through space with a velocity of about 70 km. a second in a certain direction. This investigation had to be abandoned when it was shown by Eddington that a similar discussion of the motions of the other planets would lead to vastly different values for the sun's velocity. Alternative (ii.) was explored by Einstein and others, but was found to lead to a motion of the perihelion of Mercury equal only to one-sixth part of that actually observed.

Alternative (iii.) remained with its innumerable possibilities. Einstein commenced his attack on the problem by eliminating all possibilities which did not conform to two general principles. The first of these was the principle of relativity. Inasmuch as all physical phenomena except gravitation were believed to conform to this principle, it was natural to try, as a working hypothesis, the effect of assuming gravitation also to conform. The second principle was the so-called principle of equivalence, and this demands a word of explanation.

To our children we explain that an apple falls to the ground because a force of gravitation inherent in the earth's mass impels the apple towards the centre of the earth. Most schoolboys know that this is not quite the whole story; the path of the apple is more accurately determined by supposing the apple to be acted on simultaneously by two forces—a gravitational force of attraction towards the earth's centre and the centrifugal force arising from the earth's rotation. It is only because the earth's rotation is comparatively slow that the conception of an attraction towards the earth's centre gives a tolerably plausible account of the fall of the apple. If the earth rotated at 17 times its present rate objects would not fall, even approximately, towards the earth's centre; they would fall always parallel to the earth's axis, and the inhabitants of the northern hemisphere might explain this as arising from a force of repulsion inherent in the pole star. If the earth rotated many times faster even than this, bodies would fall always perpendicularly away from the earth's axis, and this might be interpreted as arising from a gravitational repulsion residing in the earth's axis.

These illustrations will show that it is easy to confuse acceleration arising from the earth's rotation with gravitational attraction. We may go further and say that it is impossible to distinguish between the effects of gravitational attraction and the effects of acceleration of any kind whatever. Every aeroplanist knows this to his sorrow; it is inherently impossible to devise any instrument which shall show the direction of the vertical in an aeroplane, since an acceleration of the aeroplane produces on any instrument whatever, effects which are indistinguishable from those of gravity. From such considerations Einstein was led to his principle of equivalence, which may be enunciated as follows:—

A gravitational field of force at any point of space is in every way equivalent to an artificial field of force resulting from acceleration so that no experiment can possibly distinguish between them.

Guided by these two principles—relativity and equivalence—Einstein was led to the view that all gravitational "fields of force" must be illusions. The apparent "force" arises solely from acceleration and there is no other kind of gravitational force at all. In this statement, as in the statement of the principle of equivalence above, the word acceleration is used in its

widest sense. Acceleration results not only from change in the amount of a velocity, but from a change in its direction also. For instance a motor-cyclist riding in a circle at a uniform speed of 60 miles an hour will be the subject of an acceleration towards the centre of the circle. He knows that the apparent force so produced is just as real in its effects as gravitation, and to save himself from falling as a result of its influence he must incline the direction of his machine to the vertical.

It is clear that the acceleration or curvature of path which figures as gravitation cannot be an acceleration or curvature in ordinary three-dimensional space. Before the apple starts to fall from the tree there is neither acceleration nor curvature, and yet the apple is undoubtedly acted on by gravitation. Moreover, this three-dimensional space is, as we have seen, different for different observers—it is a subjective and not an objective conception, and the gravitation resulting from such a curvature could not conform to the relativity condition. Einstein was accordingly led to suppose that gravitation arose from curvature in the four-dimensional space, or continuum, in which time formed the fourth dimension. This continuum, as has been seen, is objective and if the path of the particle can also be made objective, the resulting gravitation will conform to the relativity principle. The path of the particle in the continuum is, however, simply its "world line," which we have already had under discussion. This world line is determined by natural laws, and if these are to be objective the specification of the world line must also be objective. There is, however, only one specification of world lines in the continuum which is objective in the sense that the same specification will give the same world lines to observers moving with different velocities. It is that every world line must be so drawn as to represent the shortest path between any two points on it. Mathematically, lines which satisfy this condition are known as *geodesics*. Thus Einstein was led to suppose that world lines must be geodesics in the four-dimensional continuum.

Consider for a moment a page of this volume as presenting a two-dimensional analogy of the continuum. The shortest distance between any two points is of course the straight line joining them, so that the geodesics are simply straight lines. These possess no curvature of path, and if they formed a true analogy to the geodesics in the continuum there could clearly be no explanation of gravitation of the type we have been contemplating. There is, however, another type of two-dimensional surface. It is represented by the surface of a solid body such as a sphere—say the earth. On the earth's surface the geodesics are the great circles; every mariner or aeronaut who desires to sail the shortest course between two points sails along a great circle. To take a definite instance, the shortest course from Panama to Ceylon is not along the parallel of lat. (about 9° N.) which joins them—the aeronaut wishing to fly the shortest course between the two countries will fly N.E. from Panama, he will pass over England and finally reach Ceylon from the northwest. The reader may rapidly verify this by stretching a thread tightly over the surface of an ordinary geographical globe. Let him now trace out the course on an ordinary Mercator chart, and it will be found to appear very curved indeed—the course of the aeronaut will look surprisingly like that of a comet describing an orbit under the attraction of a sun situated somewhere near the middle of the Sahara.

The reader who performs these simple experiments will understand how Einstein was led to suppose that gravitation could be explained by a curvature inherent in the continuum. The world lines of particles are geodesics but the space itself, so to speak, provides the curvature. The curvature of path is thrust upon the particle by the nature of the continuum, but we, who until recently have been unaware even of the existence of the continuum, have been tempted to ascribe it to the action of a special agency which we have invented *ad hoc* and called "gravitation." According to Einstein's view of the nature of gravitation, it is no more accurate to say that the earth attracts the moon than to say that the pockets of an uneven billiard table repel the balls.

Perhaps this train of thought may seem artificial. If so, the reason is that we have not been able to explore the other possibilities which have branched off our main line of thought. In point of fact, Einstein found himself practically limited to the conclusion we have stated. Not only so, but the actual type and degree of curvature in the continuum prove to be uniquely fixed in terms of the masses of the gravitating bodies. Thus Einstein, knowing the mass of the sun, found himself in a position to predict absolutely what the motion of the perihelion of Mercury ought to be. It was found to be  $42.9''$  a century, a figure which agreed with observation to well within the limits of error of the observations. The motions of the other planets as predicted by the theory of relativity, have also been found to agree with those observed to within the errors of observation. This latter test is not a very stringent one, since the departures from the motion predicted by the Newtonian law are too small to admit of very precise measurement.

*The Effect of Gravitation on Light.*—Einstein's theory requires that the world line of a ray of light also shall be a geodesic in the continuum. In a gravitational field the curvature of the continuum will impose a twist on the path of a ray of light. Einstein found in particular that a ray of light which comes from a distant star and passes near the edge of the sun on its journey ought to be bent, in its passage past the sun, by an angle which should be  $1.745''$  if the ray just grazes the sun, and would be less, in proportion to the inverse distance from the centre of the sun, for other rays.

The observatories of Greenwich and Cambridge dispatched expeditions to test this prediction at the eclipse of 1919. It was found that the stars which appeared near to the sun at the instant of eclipse showed an appreciable displacement, as compared with their normal positions, of the type required by Einstein's theory. Exact measurement confirmed that the displacement varied approximately as the inverse distance from the sun, and that the displacement at the limb was sensibly equal to Einstein's predicted value of  $1.745''$ . The Cambridge observers, hampered by cloudy weather, obtained for this quantity the value  $1.61'' = 0.30''$ . The Greenwich observers obtained a value of  $1.08'' = 0.12''$ , but Prof. H. N. Russell subsequently pointed out that their photographs indicate a horizontal and vertical scale difference of the order of one part in 12,000, almost certainly due to a distortion of the coelostat mirror under the sun's rays, and if the measures are corrected for this the result is brought much closer to the theoretical prediction. Three years later an expedition, sent out by Lick Observatory to observe the 1922 eclipse, was favoured by good weather and obtained for the displacement at the sun's limb, a value of  $1.72''$  with a probable error of  $0.11''$ . None of the expeditions had of course measured the deflections of stars actually at the sun's limb; most of the stars were several diameters away from the limb, the observed deflections being corrected so as to bring them to the limb. The deflections of stars at all distances were found to agree well with the predictions of Einstein's theory.

The theory makes one further prediction which admits of experimental test. The atoms of any element, say calcium, may be supposed to be formed according to a definite specification, the terms of which depend neither on the velocity of a particular observer nor on his position relative to the gravitational fields of the universe. It can be deduced that the light received from a calcium atom situated in the intense gravitational field near the sun's surface ought to be of slower period, and therefore of redder colour, than the similar light emitted by terrestrial atoms. To be more precise, the Fraunhofer lines in the solar spectrum ought to show a displacement to the red; this displacement ought to be homologous, and should be of amount  $0.008 \text{ \AA}$  units at the cyanogen band  $\lambda 3883$  at which observations have been chiefly made. Attempts to test this prediction have led to strangely discordant results. All observers have found some effect of the kind predicted, but its amount has generally been substantially less than the predicted amount, varying from almost *nil* (St. John, 1917) to nearly the full amount to be expected (Evershed, 1918 and 1923, Grebe and Bachem, 1919).

The reason is that the predicted shift of  $0.008 \text{ \AA}$  is in any case hardly greater than the normal errors of observation and is apt to be masked by larger shifts of uncertain amount arising from other causes. Larger shifts would be expected in stars which were of larger mass than the sun or of smaller radii. Many known stars have masses far larger than the sun, but they also have larger radii, and so ought to show only about the same spectral shift as the sun. On the other hand the class of stars known as "white dwarfs" have masses about equal to that of the sun, but far smaller radii. For instance calculation shows that the companion to Sirius, a star whose radius is only about a thirty-fifth of that of our sun, ought to show a shift of as much as  $0.30 \text{ \AA}$  and when the matter was put to the test at Mount Wilson Observatory, W. S. Adams found an actual shift of  $0.32 \text{ \AA}$ . It is hardly possible any longer to doubt that the spectral shift predicted by Einstein really exists.

*Further Developments.*—It will have been seen that the restricted physical theory of relativity introduced a revolution into the foundations of scientific thought by destroying the objectivity of time and space. The gravitational theory has effected a hardly less important revolution by destroying our belief in the reality of gravitation as a "force." The physicist has, however, to deal with other "forces" besides those of gravitation, and the question inevitably arises as to whether these too must be regarded as illusions, arising only from our faulty interpretation of the special metrical properties of the continuum. Prof. H. Weyl has pointed out that the continuum imagined by Einstein and found to be adequate to explain gravitational phenomena, is not, in respect of its metrical properties, the most general type of continuum imaginable. A further generalisation is possible, and the new curvatures introduced must of necessity introduce new apparent forces other than gravitational. Weyl's investigation shows that these new forces would have exactly the properties of the electric and magnetic forces with which we are familiar. Indeed, the predicted forces coincide so completely with known electromagnetic forces that no experimental test of Weyl's theory is possible. Had there been the slightest divergence between the forces predicted by Weyl and those predicted by ordinary electromagnetic theory, experiment could have been asked to decide between the two, but no such divergence exists. It may, however, be said that Weyl's theory makes it highly probable that all forces reduce to nothing more than our subjective interpretations of special properties of the continuum in which we live.

Finally a thought may be given to the position, under the new conceptions introduced by the theory of relativity, of the electromagnetic aether. At one stage in the history of science there was a tendency to fill space with aethers, to the extent almost of one aether for every set of phenomena requiring explanation. That stage passed, and by the end of the 19th century only one aether received serious consideration, the so-called electromagnetic aether of Faraday and Maxwell. This aether gave a plausible mechanical explanation of electrostatic phenomena, although it was more than doubtful whether it could account for the electromagnetic phenomena from which it took its name, and it was comparatively certain that it could not account for gravitation. It gave, however, a satisfactory explanation of the propagation of waves of light—they were simply waves in the aether and travelled with an absolute velocity  $c$  determined once and for all by the structure of the aether. On this view it was quite certain that an observer moving through the aether with a velocity  $u$  would measure the velocity of light travelling in the same direction as himself as  $c = u$ . Relativity teaches that this velocity is always precisely  $c$ , and this in itself disposes of the aether of Faraday and Maxwell. Whether any new aether will be devised to replace it remains to be seen, but none appears to be necessary. Any aether which can be imagined would appear to depend upon an objective separation of time and space. Relativity does not deny that such an objective separation may, in the last resort, really exist, but it shows that no material phenomena are concerned with such a separation. By a very slight turn of thought, the primary postulate of relativity may be

expressed in the form that the material world goes on as though no aether existed.

To the relativist the essential background to the picture of the universe is not the varying agitation of a sea of aether in a three-dimensional space but a tangle of world lines in a four-dimensional space. Moreover, it is only the intersection of the world lines that are important. An intersection at a point in the continuum represents an event, while the part of a world line which is free from intersections represents the mere uneventful existence of a particle or a pulse of light. And so, since our whole knowledge of the universe is made up of events, it comes about that the tangle of world lines may be distorted and bent to any degree we please; so long as the order of the intersections is not altered, it will still represent the same universe. And so the last function of the aether, that of providing a scale of absolute measurements in space, becomes a superfluity. To the physicist who urges that space measurements without an underlying aether become meaningless, the relativist can reply that time-measurements without an underlying "time-aether" are equally meaningless. A "time-aether" has never been regarded as a necessity, and the relativist feels that the "space-aether" has no greater claim to retention.

Weyl, *Space, Time and Matter* (1922); A. N. Whitehead, *The Principle of Relativity* (1922). (J. H. JE.)

**RELATIVITY: PHILOSOPHICAL CONSEQUENCES.**—Of the consequences in philosophy which may be supposed to follow from the theory of relativity (*q.v.*), some are fairly certain, while others are open to question. There has been a tendency, not uncommon in the case of a new scientific theory, for every philosopher to interpret the work of Einstein in accordance with his own metaphysical system, and to suggest that the outcome is a great accession of strength to the views which the philosopher in question previously held. This cannot be true in all cases; and it may be hoped that it is true in none. It would be disappointing if so fundamental a change as Einstein has introduced involved no philosophical novelty. (*See SPACE-TIME.*)

**Space-Time.**—For philosophy, the most important novelty was present already in the special theory of relativity; that is, the substitution of space-time for space and time. In Newtonian dynamics, two events were separated by two kinds of interval, one being distance in space, the other lapse of time. As soon as it was realised that all motion is relative (which happened long before Einstein), distance in space became ambiguous except in the case of *simultaneous* events, but it was still thought that there was no ambiguity about simultaneity in different places. The special theory of relativity showed, by experimental arguments which were new, and by logical arguments which could have been discovered any time after it became known that light travels with a finite velocity, that simultaneity is only definite when it applies to events in the same place, and becomes more and more ambiguous as the events are more widely removed from each other in space.

This statement is not quite correct, since it still uses the notion of "space." The correct statement is this: Events have a four-dimensional order, by means of which we can say that an event A is nearer to an event B than to an event C; this is a purely ordinal matter, not involving anything quantitative. But, in addition, there is between neighbouring events a quantitative relation called "interval," which fulfils the functions both of distance in space and of lapse of time in the traditional dynamics, but fulfils them with a difference. If a body can move so as to be present at both events, the interval is time-like. If a ray of light can move so as to be present at both events, the interval is zero. If neither can happen, the interval is space-like. When we speak of a body being present "at" an event, we mean that the event occurs in the same place in space-time as one of the events which make up the history of the body; and when we say that two

events occur at the same place in space-time, we mean that there is no event between them in the four-dimensional space-time order. All the events which happen to a man at a given moment (in his own time) are, in this sense, in one place; for example, if we hear a noise and see a colour simultaneously, our two perceptions are both in one place in space-time.

When one body can be present at two events which are not in one place in space-time, the time-order of the two events is not ambiguous, though the magnitude of the time-interval will be different in different systems of measurement. But whenever the interval between two events is space-like, their time-order will be different in different equally legitimate systems of measurement; in this case, therefore, the time-order does not represent a physical fact. It follows that, when two bodies are in relative motion, like the sun and a planet, there is no such physical fact as "the distance between the bodies at a given time"; this alone shows that Newton's law of gravitation is logically faulty. Fortunately, Einstein has not only pointed out the defect, but remedied it. His arguments against Newton, however, would have remained valid even if his own law of gravitation had not proved right.

**Time not a Single Cosmic Order.**—The fact that time is private to each body, not a single cosmic order, involves changes in the notions of substance and cause, and suggests the substitution of a series of events for a substance with changing states. The controversy about the aether thus becomes rather unreal. Undoubtedly, when light-waves travel, events occur, and it used to be thought that these events must be "in" something; the something in which they were called the aether. But there seems no reason except a logical prejudice to suppose that the events are "in" anything. Matter, also, may be reduced to a law according to which events succeed each other and spread out from centres; but here we enter upon more speculative considerations.

**Physical Laws.**—Prof. Eddington has emphasised an aspect of relativity theory which is of great philosophical importance, but difficult to make clear without somewhat abstruse mathematics. The aspect in question is the reduction of what used to be regarded as physical laws to the status of truisms or definitions. Prof. Eddington, in a profoundly interesting essay on "The Domain of Physical Science,"<sup>1</sup> states the matter as follows:—

In the present stage of science the laws of physics appear to be divisible into three classes—the identical, the statistical and the transcendental. The "identical laws" include the great field-laws which are commonly quoted as typical instances of natural law—the law of gravitation, the law of conservation of mass and energy, the laws of electric and magnetic force and the conservation of electric charge. These are seen to be identities, when we refer to the cycle so as to understand the constitution of the entities obeying them; and unless we have misunderstood this constitution, violation of these laws is inconceivable. They do not in any way limit the actual basal structure of the world, and are not laws of governance (*op. cit.*, pp. 214-5).

It is these identical laws that form the subject-matter of relativity theory; the other laws of physics, the statistical and transcendental, lie outside its scope. Thus the net result of relativity theory is to show that the traditional laws of physics, rightly understood, tell us almost nothing about the course of nature, being rather of the nature of logical truisms.

This surprising result is an outcome of increased mathematical skill. As the same author<sup>2</sup> says elsewhere:—

In one sense deductive theory is the enemy of experimental physics. The latter is always striving to settle by crucial tests the nature of the fundamental things; the former strives to minimise the successes obtained by showing how wide a nature of things is compatible with all experimental results.

The suggestion is that, in almost any conceivable world, *something* will be conserved; mathematics gives us the means of constructing a variety of mathematical expressions having this property of conservation. It is natural to suppose that it is useful

<sup>1</sup> In *Science, Religion and Reality*, ed. by Joseph Needham (1925).

<sup>2</sup> A. S. Eddington, *Mathematical Theory of Relativity*, p. 238 (Cambridge, 1924).

to have senses which notice these conserved entities; hence mass, energy, and so on *seem* to have a basis in our experience, but are in fact merely certain quantities which are conserved and which we are adapted for noticing. If this view is correct, physics tells us much less about the real world than was formerly supposed.

*Force and Gravitation.*—An important aspect of relativity is the elimination of "force." This is not new in idea; indeed, it was already accepted in rational dynamics. But there remained the outstanding difficulty of gravitation, which Einstein has overcome. The sun is, so to speak, at the summit of a hill, and the planets are on the slopes. They move as they do because of the slope where they are, not because of some mysterious influence emanating from the summit. Bodies move as they do because that is the easiest possible movement in the region of space-time in which they find themselves, not because "forces" operate upon them. The apparent need of forces to account for observed motions arises from mistaken insistence upon Euclidean geometry; when once we have overcome this prejudice, we find that observed motions, instead of showing the presence of forces, show the nature of the geometry applicable to the region concerned. Bodies thus become far more independent of each other than they were in Newtonian physics: there is an increase of individualism and a diminution of central government, if one may be permitted such metaphorical language. This may, in time, considerably modify the ordinary educated man's picture of the universe, possibly with far-reaching results.

*Realism in Relativity.*—It is a mistake to suppose that relativity adopts an idealistic picture of the world—using "idealism" in the technical sense, in which it implies that there can be nothing which is not experience. The "observer" who is often mentioned in expositions of relativity need not be a mind, but may be a photographic plate or any kind of recording instrument. The fundamental assumption of relativity is realistic, namely, that those respects in which all observers agree when they record a given phenomenon may be regarded as objective, and not as contributed by the observers. This assumption is made by common sense. The apparent sizes and shapes of objects differ according to the point of view, but common sense discounts these differences. Relativity theory merely extends this process. By taking into account not only human observers, who all share the motion of the earth, but also possible "observers" in very rapid motion relatively to the earth, it is found that much more depends upon the point of view of the observer than was formerly thought. But there is found to be a residue which is not so dependent; this is the part which can be expressed by the method of "tensors." The importance of this method can hardly be exaggerated; it is, however, quite impossible to explain it in non-mathematical terms.

*Relativity Physics.*—Relativity physics is, of course, concerned only with the quantitative aspects of the world. The picture which it suggests is somewhat as follows:—In the four-dimensional space-time frame there are events everywhere, usually many events in a single place in space-time. The abstract mathematical relations of these events proceed according to the laws of physics, but the intrinsic nature of the events is wholly and inevitably unknown except when they occur in a region where there is the sort of structure we call a brain. Then they become the familiar sights and sounds and so on of our daily life. We know what it is like to see a star, but we do not know the nature of the events which constitute the ray of light that travels from the star to our eye. And the space-time frame itself is known only in its abstract mathematical properties; there is no reason to suppose it similar in intrinsic character to the spatial and temporal relations of our perceptions as known in experience. There does not seem any possible way of overcoming this ignorance, since the very nature of physical reasoning allows only the most abstract inferences, and only the most abstract properties of our perceptions can be regarded as having objective validity. Whether any other science than physics can tell us more, does not fall within the scope of the present article.

Meanwhile, it is a curious fact that this meagre kind of knowledge is sufficient for the *practical* uses of physics. From a

practical point of view, the physical world only matters in so far as it affects us, and the intrinsic nature of what goes on in our absence is irrelevant, provided we can predict the effects upon ourselves. This we can do, just as a person can use a telephone without understanding electricity. Only the most abstract knowledge is required for practical manipulation of matter. But there is a grave danger when this habit of manipulation based upon mathematical laws is carried over into our dealings with human beings, since they, unlike the telephone wire, are capable of happiness and misery, desire and aversion. It would therefore be unfortunate if the habits of mind which are appropriate and right in dealing with material mechanisms were allowed to dominate the administrator's attempts at social constructiveness.

**RELIEF WORK.**—Upon the outbreak of the World War in 1914 relief problems far surpassed the capabilities of private charity, involving broad questions of governmental finance, control of production, purchase and transport of huge quantities of supplies from one part of the world to another, intervention of diplomatic agencies, control of shipping and railways, and finally, after the War, general economic rehabilitation and broadly conceived treatment of fundamental social ills. For the first time in history, virtual world control of production and distribution of food was attained (*see* RED CROSS).

#### CIVILIAN RELIEF IN BELGIUM AND FRANCE

During the occupation of Belgium inhabitants found themselves in desperate straits from the interruption of agriculture and the confiscation of stocks by the occupying forces. Belgium's essential food imports were cut off, and hordes of refugees fled before the advancing German armies. A Belgian committee was formed and appealed for aid. Herbert Hoover, an American engineer, recognised the urgency of the situation, and with the backing of the U.S. Govt. persuaded the Allied Govts. to open the blockade and to secure proper guarantees from Germany against interference and requisitioning of local food products that would otherwise have to be imported. The Commission for Relief in Belgium (C.R.B.) established by Herbert Hoover as a neutral organisation in the midst of war, possessing recognised diplomatic rights and obligations, flying its own flag and issuing its own passports, held an unprecedented status.

The commission faced not only large problems of transportation, blockade and distribution, but the marshalling of hundreds of millions of dollars to supply food to the 9,000,000 inhabitants of Belgium and northern France. Food had to be secured in disorganised markets, supplies had to pass across mine-strewn North Sea waters through the naval blockade, be transhipped to barges and towed through 133 m. of obstructed waterways, passing across the German military line. The first relief cargo of 2,300 tons of food reached Brussels on Nov. 1 1914. It led a procession of relief vessels, 2,313 in number, carrying in the neighbourhood of 100,000 tons each month for nearly five years.

The harvest of 1914, at the time of the invasion, was uncontrolled; but in addition to many other diplomatic guarantees exacted from both Germany and the Allies, the commission formed a committee of Germans, Belgians and Americans which took over subsequent harvests of breadstuffs, insuring equitable distribution to the civil population. The world's charity was mobilised through nearly 2,000 committees located in the United States, Great Britain, Canada, Australia, New Zealand, India, South Africa, Holland, Italy, Spain, Argentina and elsewhere. Within Belgium and northern France were set up nearly 10,000 communal committees dealing with food supplies. Purchasing and shipping agencies were organised in the principal world markets and ports. Offices for governmental liaison were maintained at Brussels, London, Paris and Washington. Upon America's entry into the War the C.R.B. remained unchanged, except for the necessary withdrawal of American directors from within the German lines. The Spanish-Dutch committee for the protection of the relief in Belgium and northern France was formed,

and took over diplomatic and other functions within the lines. The national committees, one Belgian and one French, for diplomatic reasons necessarily under control of the C.R.B., administered distribution. These were the Belgian Comité National de Secours et d'Alimentation and the Comité d'Alimentation du Nord de la France under the leadership of Emile Francqui.

During the whole period of relief the commission acquired goods well over \$1,300,000,000 in value, including interchange of native products. More than 55,000 volunteers gave their services. Over 5,000,000 tons of supplies were imported. Foods were acquired by purchase abroad with gift money, from gifts in kind, by purchase from commercial exchange out of Belgium, and by purchase with governmental subsidies. The Belgian Govt. granted monthly fixed subsidies to the commission from loans advanced by the United States, Great Britain and France. The actual financial resources of the commission amounted to \$894,797,150, the expenditure of the benevolent side of the relief organisation was \$615,237,147 of this total. Of the total funds available to the commission, 47% came from the United States (\$421,153,287); 23% from French Treasury loans (\$204,862,854); 14% from British Empire sources (\$125,686,364); and 16% from other sources. The total administrative expenditure of the C.R.B. was kept down to less than one-half of one per cent. The average prices maintained for staple foods in the occupied territory during the entire period of the War were from 15 to 20% less than prices in the Allied countries at the same periods. With the signature of the Armistice the programme increased to revive the weakened population, and the Belgian and French Govts. in May 1919, took the responsibility of feeding their people.

#### RELIEF IN CENTRAL EUROPE

When peace came in Nov. 1918 the Allied and associated Govts. were confronted with the necessity of extending relief not only to liberated territories in central Europe but also to their enemies. From the Baltic to the Adriatic and Black Seas hundreds of millions of people needed food to save them from an even greater catastrophe that would follow if they were allowed to starve before agricultural production could be brought back and before industries and transportation could be restarted. Herbert Hoover was appointed director-general of Allied Relief, acting under the Supreme Economic Council. Because America found itself in a better food position than any of the nations of Europe, the United States was destined to play the principal part, supplemented by a substantial programme of Great Britain. Mr. Hoover formed the American Relief Administration (A.R.A.) to carry out the work, placing financial, purchasing and shipping problems in charge of the U.S. Grain Corporation. To assure the success of the complicated arrangements for the mass feeding of millions of people the director-general assumed temporary control of railways in central and southern Europe, re-established or controlled 10,000 m. of telegraph and telephone lines, arranged barge shipments on European rivers, initiated food exchanges between the newly established states, re-allocated army supplies suitable for civilian needs, established a temporary monetary exchange system, furthered the import of raw material, controlled coal production and in general helped struggling governments to re-establish normal economic life.

Food from America had to be transported overseas and distributed in 21 countries or states, including Allied, neutral, ex-enemy and the smaller new states. American deliveries to Allied or neutral countries were financed on credit by the U.S. Treasury. With the exception of Austria, deliveries to ex-enemy countries were paid for in cash. Deliveries to the new states were either outright gifts or long-term loans without considering ability to repay. In addition to U.S. credits and other resources, the U.S. Congress appropriated \$100,000,000 as a revolving fund for the operations. Ex-enemy countries were excluded from benefits from this fund. Allied and neutral countries supplied by the United States were Italy, Denmark and Holland; ex-enemy countries supplied against cash payments were Germany, Austria, Hungary, Bulgaria and Turkey. The so-called liberated territories supplied were Finland, Estonia, northwest Russia,

Latvia, Lithuania, Poland, Belgium, northern France, Czechoslovakia, Rumania, Yugoslavia, south Russia and Armenia.

Great Britain's part in these measures was large. Notwithstanding its difficult financial position, the British Govt. was able to appropriate £12,500,000 and to set up other substantial grants. Great Britain agreed to fill the gaps between what the United States could provide and what was required for barest necessities in war-torn regions. British assistance was given to Poland, Serbia, Czechoslovakia, Rumania, Estonia and Austria. The British relief was administered by Sir William Goode.

During the Armistice year relief deliveries to Europe reached about 4,760,000 tons of food valued at over \$1,147,600,000. More than two-thirds of the programme, or \$870,000,000 worth, came from the United States. About \$120,000,000, or 10%, came from the United Kingdom; from France and Italy about 2% each; about 4% was financed jointly by the United States, France and Italy; and about 5% came from other countries. Of the U.S. deliveries in 1919 about 20% were sold for cash, 77% on credit and 2.2% (\$19,300,000) as charity. Of the British deliveries 65% were sold for cash, 32% on credit and 3% (\$3,500,000) as charity. Operations were supervised largely by army and navy officers, whose services were lent by their governments. Inland transportation was paid for by the governments aided. Local ministries and native volunteer committees attended to distribution.

These prompt relief measures undoubtedly saved Europe from an even greater social cataclysm than her people had already suffered. Weakened by war, without food or employment, eastern Europe provided a breeding ground for anarchy and social revolution of the brand that had already laid Russia in economic ruin. Russian emissaries of world proletarian revolution actively spread through the small new states whose governments were inexperienced, tossed in political turmoil and in fervid Chauvinistic conflict with surrounding neighbours. The relief operation laid down "a wall of food" against militant Russian Bolshevism, in fortifying the people for resumption of the production without which they could not live. They helped to bring order out of chaos to the end that factories could start and transportation be resumed.

*Privately Organised Relief.*—With the signing of peace, all these Allied and American organisations passed out of existence. Certain stocks given by the American Govt. for charitable purposes were turned over to a new private organisation formed by Herbert Hoover, also known as the American Relief Administration. Large numbers were still faced by extreme shortage. Children were the greatest sufferers. The new privately organised A.R.A. carried on mass child feeding in Finland, Estonia, Latvia, Lithuania, Danzig, Poland, northern France, Czechoslovakia, Austria, Hungary, Rumania, Yugoslavia and Armenia. American Quakers co-operated with the A.R.A. in feeding over 1,000,000 children in Germany. With gradual reductions, as were permitted by economic recovery, the work was carried on until 1923.

During the whole of that period about 8,000,000 different children benefited from these charitable relief importations. Free cooked meals were distributed to as many as 4,000,000 children daily at one time, to whom a total of over 1,500 million meals were served. Warm clothing to the value of over \$8,000,000 was distributed to more than 2,000,000 children. Each of the countries aided assumed the burden of transportation and storage within their country and assisted in distribution. These governments also donated some foods and financed some of the foreign importations. Over 100,000 men and women co-operated in this preservation of the coming generation from war's ravages. Their ready response demonstrated the effectiveness of a foreign aid specifically organised to help the people of these new states to help themselves, rather than to dispense a charity which merely maintained an individual or group without offering aid and incentive to self-help. National welfare bodies thus founded and built up by the A.R.A. were perpetuated in many countries. The total amount expended for these post-War charitable operations reached nearly \$100,000,000.

*Prisoners of War.*—Dr. Fridtjof Nansen prevailed upon the newly formed League of Nations to help in repatriation of prisoners of war, bringing more than 427,000 war prisoners out of Russia and Siberia back to their homes in a dozen countries. Prominent in post-War relief works were the Save the Children funds of Great Britain and many other countries which, through Dr. Nansen, brought help to eastern European countries; the American Jewish Joint Distribution Committee in Poland, Czechoslovakia, Austria and other places; several Irish relief committees; the American and British Societies of Friends (Quakers). The French war orphans committee brought aid to children in devastated France. The Rockefeller Foundation gave over \$22,500,000 for the relief work of the Commission for Relief in Belgium and other charitable purposes.

*Russian Famine.*—When these post-War relief operations were closing down, famine in Russia brought 25,000,000 people in the Volga valley face to face with starvation. Herbert Hoover revived the American Relief Administration, secured grants from the U.S. Govt., induced the Soviet Russian Govt. to purchase seed grains, and rushed food, grain and medical supplies to the stricken country. Because of dilapidated ports, broken-down railways, the general inertia of the broken morale of the Russian people, and the dissolution of the productive organism, complicated by suspicions of the so-called proletarian Soviet Govt. against emissaries from "capitalistic" America, the task of bringing immediate and effective relief to the people in an area of 770,000 sq. m. was immense. It was necessary to initiate and supervise every step of operations of transport and distribution amid greatest economic disruption and appalling scenes of misery.

The administration of this relief was accomplished by less than 200 persons supervising a distributing organisation of nearly 150,000 Russian workers. More than 10,000,000 people were fed; medical and sanitary supplies valued at \$7,600,000 were distributed to 16,500 hospitals and other institutions to combat the spread of typhus, cholera, and other epidemics following in the wake of famine; over 8,000,000 vaccinations or inoculations against smallpox, typhoid and para-typhoid were given to people in epidemic regions; 200,000 tons of seed grain were distributed; and other relief measures brought the total value of American relief to the Russian famine to about \$60,000,000. The work was made possible by the contribution of \$24,000,000 in cash and medical supplies by the U.S. Govt., of \$3,600,000 worth of medical supplies by the American Red Cross, about \$4,000,000 by the American joint distribution committee, and of \$12,000,000 worth of seed grain purchased and transported by the A.R.A. against gold payment by the Soviet Government. Many other American groups co-operated with Mr. Hoover in furnishing means to an extent of nearly \$3,000,000. These were the Society of Friends, Mennonite relief, European student relief, Federal Council of Churches of Christ in America, Knights of Columbus, National Catholic welfare council, National Lutheran Council, Volga relief society, Y.M.C.A. and Y.W.C.A. The Russian operations of the American Relief Administration started in Sept. 1921, and were brought to a close in July 1923. Although the sums thrown into Russian famine relief by British agencies and the Nansen relief committee were small in comparison with the American relief, the accomplishment was effective. As High Commissioner for the League of Nations, Dr. Nansen also co-operated with the A.R.A. in care of Russian refugees in the Balkans, arranging for the transport of some 15,000 of these refugees to other localities where they could be supported. (See ROCKEFELLER FOUNDATION.)

**REMIZOV, ALEXIS** (1877- ), Russian novelist, was born June 24 1877 in Moscow and brought up amid factory surroundings and in the strict observance of Orthodox Church rites, with frequent pilgrimages to monasteries. He thus gained an intimate knowledge of national habits, monastic life and old religious legends. He studied natural science and economics at Moscow University, took part in revolutionary activities, and was imprisoned and spent years of exile in Wologda. He subsequently went to live in Paris. The influences of his varying

surroundings contributed to the formation of his unique fantastic personality uniting the whimsical mischievousness of some fairy-tale sprite with a deep spirit of pity. His literary life dates from 1902; from that time until 1920 he published 36 volumes of fiction: novels, tales, short stories and fairy-tales, miracle plays, etc.

The most remarkable of Remizov's novels are *The Pond* (1905), a powerful and gloomy picture of vulgarity, vice and crime among the Moscow bourgeoisie and the monasteries. *The Clock* (1908, Eng. trans. 1924), *The Fifth Pestilence*, novels of provincial life; *The Sisters of the Cross* (1910), a novel of St. Petersburg life; also *The Cockerel* and stories relating to the revolution of 1905, and several miracle and folk plays. A great realist, Remizov has perhaps exercised more influence than anyone else of his generation upon contemporary Russian fiction.

**RENEVIER, EUGÈNE** (1831-1906), Swiss geologist (see 23.98), died at Lausanne May 4 1906.

**RENNER, KARL** (1870- ), Austrian politician, was born on Dec. 14 1870, the son of a peasant, at Dolní-Dunajovice, Moravia. He studied law at the university of Vienna, and early attached himself to the Social Democratic party. He became an official in the library of the Reichsrat, and under the pseudonyms of "Synopticus" and "Rudolf Springer" showed a fertile literary activity, especially in connection with the problems of the Austrian state, whose existence he justified on geographical, economic and political grounds. On the nationality question he upheld the so-called "personal autonomy," on the basis of which the super-national state should develop, and thereby influenced the programme and tactics of the Social Democratic party in dealing with it. As a theorist he was reckoned as one of the leaders of Neo-Marxism. He had been a deputy since 1907, and, as leader of the Social Democrat party, he repeatedly attacked the Government. He deeply influenced the movement which preceded the fall of the monarchy. After the collapse he became head of the Government, and after the elections had given the Social Democrats and Christian Socialists an overwhelming majority, he formed a coalition ministry, as the leader of which he became the first chancellor of the Austrian republic.

Renner was largely responsible for the decrees of the national assembly which called for the dethronement of the dynasty of Habsburg-Lorraine and the banishment of all members of this house if they did not submit entirely to the laws of the republic, and he was in charge of the negotiations which led to the ex-Emperor Charles leaving Austria in March 1919. He was responsible for thwarting the separatist endeavours of the different provinces and the demands which the Communists, supported by their partisans in foreign countries, made with the object of overthrowing the Government. On May 12 1919, he went to Paris as head of the Austrian Delegation to receive the conditions of peace from the victors. On his return consultations were held whether to accept or to refuse the conditions of peace. Otto Bauer, who at that time was secretary for foreign affairs, refused to take responsibility for certain provisions of the treaty, and resigned. Renner now took over the conduct of foreign affairs and signed the Treaty of St. Germain-en-Laye of Sept. 10 1919. It was accepted by the National Assembly in Oct. 1919, and came into force in July 1920. In Dec. 1919 Renner went to Paris to depict Austria's miserable situation to his former enemies and to beg for help. His efforts were not without success. A special Austrian section of the Reparations Commission was appointed to study the measures necessary for a lasting cure for the ills of the body politic and gradually brought help. It is true that the Republic grew more and more dependent on the Powers signatory to the treaty of St. Germain, in consequence of the interference of the various inter-allied commissions which had to supervise the disarming of Austria by land, sea and air.

Meanwhile, the first coalition ministry had been succeeded in Oct. 1919 by a second, in which Renner was again chancellor and secretary for foreign affairs. His endeavours were now directed towards establishing better relations with the succession States. The journeys which he undertook to this end to Rome

and Prague were not unsuccessful and paved the way to further negotiations. On the other hand, the relations between the Austrian Government and Hungary, which since the régime of the revolution had been succeeded by a reaction, were very strained. Renner, who, as a Social Democrat, had been inimical to the reactionary Hungarian Government and feared that an accession of strength to it would bring danger to the Austrian Republic, refused the Hungarian Government the assistance which it asked in its struggle with the leaders of the Soviet party, who had fled to Vienna. This brought him into conflict with the Christian Socialists and their representatives in the Cabinet. The coalition broke up in June; but Renner remained in charge of foreign affairs in the so-called "proportional cabinet," only resigning in Oct. 1920. He continued to take part in the parliamentary debates and the enterprises of the Social Democrat party. But his influence rapidly declined.

His principal works are *Grundlagen und Entwicklungsziele der Österreichisch-ungarischen Monarchie* (1906); *Oesterreichs Erneuerung* (1919); *Die Wirtschaft als Gesamtprozess und die Sozialisierung* (1924). (A. F. Pr.)

**RENOIR, AUGUSTE** (1841-1919), French painter (see 23.101), died at Cagnes, France, Dec. 3 1919.

**REPARATIONS AND THE DAWES PLAN.**—The Treaty of Versailles in June 1919 did not directly settle or deal with the question of reparations in its financial aspects. It placed on Germany the moral responsibility for all damage done to the population of the Allied countries (see VERSAILLES, TREATY OF). It set up a Reparation Commission to translate the Treaty into actual figures by assessing the damage, to lay down the method and times of payment, and to come to its determination by May 1921.

## I. FROM THE TREATY TO THE LONDON CONFERENCE

*San Remo to Spa.*—In April and May 1920 the Allies (Great Britain, Belgium, France, Italy and Japan) met in conferences at San Remo and Hythe, and discussed in a preliminary way the methods of computing the liability of the enemy countries and also of sharing the proceeds. The Supreme Council had their own experts making computations, the Reparation Commission in the meantime continuing their investigation of the damages and mode of collection. (At this stage there was a tentative agreement for France to pay her debt as and when she received payment from Germany.) In June 1920 at Boulogne, statements of actual amounts emerged. A minimum annuity of 3,000 million gold marks for 35 years, with a maximum aggregate of 269,000 million, was proposed; the actual amount to be settled by economic conditions. The costs of military occupation were to be a first charge on the "deliveries in kind," of which coal was the chief, and customs and natural resources were to be employed as guarantees. At the important Spa Conference—July 1920 (following a meeting of experts at Brussels) and with Germany and Portugal represented, they discussed proposals for Germany to pay 42 annuities aggregating 240,000 million gold marks; coal deliveries were fixed at two million tons monthly forthwith. There was an actual agreement, which has survived, as to the division of the proceeds as follows:—

|                | %  |                                | %    |
|----------------|----|--------------------------------|------|
| France         | 52 | Belgium                        | 8    |
| British Empire | 22 | Japan and Portugal             | 1.50 |
| Italy          | 10 | Others (Greece, Rumania, etc.) | 6.50 |

A priority for 2,000 million gold marks was given to Belgium. At this conference the Germans expressed their views on the importance of territorial integrity, and the necessity for first securing an "export surplus" before making any payment in cash or kind.

*The Paris Decisions.*—In Dec. 1920 financial experts met in Brussels and made recommendations to the Supreme Council, and on Jan. 29 1921 the Allies reached the "Paris decisions." The fixed annuities were to be:—

- 2 annuities of 2 milliard gold marks.
- 3 annuities of 3 milliard gold marks.
- 3 annuities of 4 milliard gold marks.
- 3 annuities of 5 milliard gold marks reached by May 1932.
- 31 annuities of 6 milliard gold marks reached by May 1963.

These 42 annuities were to be paid from 1921 equal to 12% of the value of Germany's exports. Supervision of Customs and occupation of the Ruhr in event of failure were discussed. In Feb. 1921 the various Allies had submitted their "claim" to the Reparation Commission. For damages alone the claims totalled about 100 milliard gold marks (1 milliard gold marks=50 million sterling) but including other claims the total was about 225 milliard gold marks, or, say, 11,600 million sterling. In March 1921 at the first London Conference, Germany proposed 1,500 million pounds in cash over 30 years; with credit for 1,000 millions already paid. In April through the United States a vastly increased offer was made with stipulations about the return of surrendered territory.

## II. FROM THE LONDON CONFERENCE TO THE DAWES COMMITTEE

*The London Ultimatum.*—On April 27 1921, the Reparation Commission announced their "assessment" as 132 milliard gold marks (6,600 million sterling, or 58% of the claim). The decision did not refer to Germany's "capacity to pay" at all—it was a computation of legal liability, on the terms of the treaty. The Allies decided that this was to be paid in annuities of £100,000,000, plus 26% of German exports. Three series of bonds were to be issued, two in 1921, (a) 600 million pounds, (b) 1,900 million, and the balance as series (c) 4,100 million at such time as the Reparation Commission might determine. These bonds were to bear 5% interest, and 1% amortisation.

Upon this report the London Conference issued an ultimatum (May 5 1921), giving effect to those decisions and also deciding that deliveries of coal and materials, etc., were to continue, Germany being given credit for the appropriate values. A Committee of Guarantees was to be set up to report upon the German fiscal revenues and to supervise the actual machinery for delivering funds, etc. Occupation of the Ruhr Valley and penalties in regard to customs and other revenues were proposed in case Germany failed to accept the terms.

The first payment of one milliard gold marks due by Sept. 1 1921 was actually paid over, partly out of foreign balances which had accumulated prior to May, partly by sales of paper marks on the Exchange, and partly by temporary advances from an international group of banks. Deliveries in kind after May covered the Nov. instalment. The export tax, a quarter of a milliard, was paid for the first quarter.

In Oct. certain details were agreed between the French and German ministers at Wiesbaden in regard to deliveries in kind for France, in place of the 26% export tax, and the practical details of these agreements were subsequently accepted by the other Governments concerned.

Difficulties began to arise almost immediately in regard to the payment of the annuities. In Aug. 1921, Mr. J. M. Keynes first published his famous prediction that the instalments of Jan. and Feb. 1922 might be covered out of further "deliveries," temporary advances and foreign assets of German industrialists. But the payment of April 1922 would present more difficulty. "Sometime between Feb. and Aug. 1922 Germany will succumb to an inevitable default. This is the maximum extent of our breathing space." In Dec. 1921 the German Government notified the Reparation Commission that their attempt to raise a foreign loan having been abortive, they could not raise in addition to deliveries in kind more than 200 million gold marks on account of the payments for Jan. and Feb. 1922. There were conferences of the Allied Prime Ministers at London in Dec. 1921 and Cannes in Jan. 1922, as a result of which the Commission granted a moratorium to Germany from the amounts due under the schedule of payments, accepting payments of 31 million gold marks every 10 days. It was laid down that Germany was to present plans for balancing the budget, stabilising the

currency and preventing exports of capital. Shortly after, Germany made an offer of 720 million gold marks per annum in addition to 1,450 million by deliveries in kind, agreeing to balance the budget, increase the coal and sales tax and check inflation by a compulsory loan. Germany asked for a reduction of the Treaty payments to an amount within her capacity.

At the Paris Conference in March (March 11 1922) the Reparation Commission were asked to consider the possibility of an external loan, but an international committee of bankers, which met at the end of May, concluded that such a loan was impossible so long as Germany's external liabilities remained at the figure arranged. Meanwhile in March 1922 the Reparation Commission agreed to a payment of 720 million gold marks inclusive, as the cash payment, suspending the schedule of payments in the meantime, and laying down that Germany should impose her new taxation at once or be exposed to the "sanctions" of the London Agreement.

In Aug. 1922, after Germany had asked for 2½ years' moratorium, the third London Conference and the Reparation Commission suspended cash payments, and agreed to accept the balance of instalments for 1922 in six months' bills at 4½%. It was laid down that further default would bring about the seizure of productive guarantees. In Nov. the German Govt. replied requesting a definite moratorium and the revision of the total payments. They asked for time to carry out the plans for stabilisation recommended by the currency experts.

*The British Proposals of Jan. 1923.*—In Jan. 1923 there was a Conference in Paris of the Prime Ministers, when a somewhat complicated proposal was put forward by Britain for an issue of 50 milliards of "A" bonds maturing in 1954, with interest deferred entirely for the first four years, and 1% for the next four down to the end of 1930. There was to be an issue of "B" bonds, to be definitive unless Germany proved to a tribunal before April 1933 her inability to meet the payment, and deliveries in kind were to be continued for determined amounts, with any excess to be set off against the bond interest. This plan was linked up with the question of Inter-Allied Debts and their cancellation. Germany was to agree to the currency stabilisation plan recommended by the foreign experts a few weeks previously. She was to balance her budget within two years and accept a foreign finance supervision which should supersede the Reparation Commission in all executive functions. There were also conditions as to Germany's forfeiture of customs and the allocation of loans, issued in the allied markets, to the redemption of the bonds.

At the same time the French Prime Minister put forward a proposal to adhere to the capital sums determined in May 1921, with a moratorium of two years, giving Germany the power to repay under discount. The customs were to be retained as productive pledges, and the Reparation Commission were to take control of German finance. France agreed that if any of her debts to the Allies were remitted, she would be prepared to consider the question of reducing Germany's total indebtedness.

*The Ruhr Occupation.*—During the comparative deadlock that followed, France began to carry out her proposals for the occupation of the Ruhr. In the immediate ensuing period considerable doubt existed as to the effect of the occupation upon reparations, but by May and June the Germans had become thoroughly alarmed, and their proposals for the evacuation of the Ruhr Valley and the restoration of Germany's economic freedom, were contained in special German notes the net effect of which was that the capital debt should be fixed at 30 milliard gold marks, of which 20 milliards would be covered by an international loan in July 1927, 5 milliards two years later, and 5 milliards by July 1931, the proceeds to be given over to the Reparation Commission. As guarantees for the service of these loans they were to mortgage the railways for 10 milliards, yielding 500 million gold marks per year; 500 million from the general mortgage on the industries and natural resources of Germany and, thirdly, the pledge of their consumption taxes, i.e., luxury, tobacco, beer, wine and sugar, to an amount probably exceeding 200 million gold marks.

Germany suggested an international conference to determine their capacity to make further payments. The effect of inflation and the general disintegration of German finance, became very marked, and Germany's whole constitutional fabric was in grave danger. (See GERMANY: ECONOMIC HISTORY.)

*Appointment of the Dawes Committee.*—Towards the end of the year active steps were being taken to set up an international committee of experts to consider Germany's position, and to make proposals for stabilising the currency and balancing the budget. The credit for this proposal has been variously assigned to Mr. Hughes of the United States, to Sir John (afterwards Lord) Bradbury on the Reparation Commission, and to the International Chamber of Commerce Conference at Rome. The representatives of this Committee were in form chosen by the Reparation Committee and appointed by them. But their selection was made a matter of Government interest in each country, there being two representatives from France, Belgium, Italy, Great Britain and the United States respectively. The chairmanship was put into the hands of the United States in the person of General Dawes, and this Commission became afterwards known as the "Dawes Committee," and its Report as the "Dawes Report." The personnel of the Committee was as follows: United States—General Charles G. Dawes, Owen D. Young; Great Britain—Sir Robert Kindersley, G.B.E., Sir Josiah Stamp, K.B.E.; France—J. Parmentier, Professor Alex; Italy—Dr. Alberto Pirelli, Professor Flora; Belgium—E. Franqui, Baron Houtart. (There was a second committee under the chairmanship of the Rt. Hon., Reginald McKenna, set up "to consider the means of estimating the amount of German exported capital and of bringing it back to Germany.")

### III. THE DAWES REPORT

The Dawes Committee began its meetings in Paris on Jan. 14 1924 and reported on April 9 1924. Although neither the evacuation of the Ruhr nor the question of reparations was mentioned in the terms of reference they really were in the forefront of the task. In the first place, so long as the occupation of the Ruhr continued and Germany was not a complete fiscal unit, she had not entire control of her receipts and expenditure, and there could be no guarantee of a balanced budget. In the second place, the reparation liabilities under the Treaty figured amongst the budgetary expenses, and if in excess of budgetary possibilities, made it impossible to guarantee that steps taken for the stability of the currency would be permanent and effective. The question of Reparations, therefore, figured prominently in the Report.

*General Principles.*—The Report adopted a business attitude and considered political factors only in so far as they affect the practicability of the plan. It sought the recovery of debt, not the imposition of penalties, regarding the payment of that debt by Germany as her necessary contribution to repairing the damage of the War. The committee recommended it as in the interest of all parties to carry out this plan in good faith, these assurances being paramount having regard to the temper ruling at that time, and the suspension of motives. They avoided the political guarantees which had been so prominent hitherto and proposed only economic ones. They were emphatic that for success in stabilising currency and balancing budgets, Germany needed the resources of German territory as defined by the Treaty of Versailles, and free economic activity therein. On the vexed question of military "sanctions" and occupation which were strictly beyond their terms of reference, they confined themselves to stating "within the unified territory, the plan requires that, when it is in effective operation:—

1. If any military organisation exists, it must not impede the free exercise of economic activities;
2. There shall be no foreign economic control or interference other than that proposed by the plan."

The report treated stabilisation of currency and the balancing of budgets as interdependent, though provisionally separable for examination, and insisted that currency stability could only be maintained if the budget were normally balanced; while the

budget could only be balanced if a stable and reliable currency existed. Both were needed to enable Germany to meet her internal requirements and treaty payments. They laid stress upon Germany's economic future as indicated by her productive power, plant capacity, increasing population, technical skill, material resources and eminence in industrial science.

*Organisation of the Reichsbank.*—In their proposal for the stabilising of the currency they suggested that a new bank be set up or the Reichsbank reorganised. The main characteristics of the bank were given:—

1. To issue notes on a basis stable in relation to gold, with an exclusive privilege;
2. To serve as a bankers' bank, establishing the official rate of discount;
3. To act as the Government banker, but free of Government control;
4. Advances to Government to be strictly limited;
5. To hold on deposit reparation payments;
6. The capital of the bank will be 400 million gold marks;
7. It will be directed by a German president and managing board, who can be assisted by a German consultative committee;
8. The due observance of its statutes will be further safeguarded by a General Board, of which half of the members, including a commissioner, will be foreign.

They were emphatic that even granted full economic and fiscal sovereignty, balancing the budget would necessitate a period of relief from reparation payments, though the pressure of political interests was too great to allow of a complete suspension of deliveries in kind.

Although the budget might be balanced without the total capital debt of Germany being fixed, they maintained it could not be continuously balanced if there were any uncertainty as to the maximum annual charge that would fall upon it for some years, on a basis clearly prescribed in advance. The report deferred to the principle that the German people ought to bear a burden commensurate with that in the Allied countries, and they claimed to apply the principle "to the full limit of practicability."

*The Transfer Committee.*—A transfer committee of an international constitution was set up to control the "delivery" programme, to receive the payments in marks in Germany, and to be responsible for the extent to which, and the way in which, these sums were transferred abroad in foreign currencies. Thus the mistake of forcing Germany beyond the economic point in the purchase of foreign currencies, which had been made in the past, was guarded against for the future. No attempt was made, as it was outside the terms of reference, to assess the length of time during which these payments should be made, or the total amount of the Reparation debt, but it was clear that the amount to be paid in the standard year, viz.:  $2\frac{1}{2}$  milliards would not do more than pay the interest on a portion of the liability imputed under the Treaty. It was provided, however, that the payments in the standard year should be increased with the increasing prosperity of Germany, the measure to be determined by an "Index of Prosperity" based upon comparative statistics of imports, exports, public revenues, population, consumption of sugar, etc. In this way it was at least possible that the sums ultimately payable annually would be greatly in excess of the  $2\frac{1}{2}$  milliards in the standard year. In the event of the economic circumstances of Germany's foreign trade being such that the transfer committee could not succeed in transferring the whole sum to the Allies, it was provided that there should be an accumulation in Germany up to a limit of 5 milliards, at which point, if necessary, the payment should be reduced.

The report set out the varying economic principles underlying reparations which up to that time, had not been generally recognised by the public, or acted upon by politicians. It was laid down, for example:

There has been a tendency in the past to confuse two distinct though related questions, i.e., first the amount of revenue which Germany can raise available for reparation account, and, second, the amount which can be transferred to foreign countries. The funds raised and transferred to the Allies on reparation account cannot, in the long run, exceed the sums which the balance of payments makes it possible to transfer without currency and budget instability

ensuing. But it is quite obvious that the amount of budget surplus which can be raised by taxation is not limited by the entirely distinct question of the condition of external transfer. We propose to distinguish sharply between the two problems, and first deal with the problem of the maximum budget of surplus and afterwards with the problem of payment to the Allies. In the past, the varying conclusions formed as to Germany's "capacity" have often depended upon which of these two methods has been chosen.

*Schedule of Payments.*—The provisions made for payment under the treaty were as follows:—

| Budget; Moratorium Period:                                                                                                                                                                    | Million gold marks |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| First Year: from foreign loan and part interest (200 millions) on railway bonds;                                                                                                              |                    |
| Total of                                                                                                                                                                                      | 1,000              |
| Second Year: from interest on railway bonds (including 130 millions balance from first year) and interest on industrial debentures and budget contribution, including sale of railway shares; |                    |
| Total of                                                                                                                                                                                      | 1,220              |
| Transition Period:                                                                                                                                                                            |                    |
| Third Year: from interest on railway bonds and industrial debentures, from transport tax and from budget;                                                                                     |                    |
| Total of                                                                                                                                                                                      | 1,200              |
| Subject to contingent addition or reduction not exceeding 250 gold marks.                                                                                                                     |                    |
| Fourth Year: from interest on railway bonds and industrial debentures, from transport tax and from budget;                                                                                    |                    |
| Total of                                                                                                                                                                                      | 1,750              |
| Subject to contingent addition or reduction not exceeding 250 million gold marks.                                                                                                             |                    |
| Standard Year:                                                                                                                                                                                |                    |
| Fifth Year: from interest on railway bonds and industrial debentures, from transport tax and from budget;                                                                                     |                    |
| Total of                                                                                                                                                                                      | 2,500              |

The first year was to begin to run from the date when the plan should have been accepted and made effective. These payments were to be absolutely inclusive of all the various expenses for military purposes that were being thrown upon Germany. They were also to include the value of deliveries in kind.

*Securities for Payment.*—The "securities" proposed were of three kinds: Taxes, railways and industrial debentures. As regards railways, the whole system was to be made over to a company and be no longer directly under the Reich. Railway bonds were to be set up. Eleven milliards of first mortgage railway bonds against a capital cost of 26 milliards to be created for reparations; these bonds to bear 5% interest and 1% sinking fund per annum; in view of reorganisation, interest to be accepted as follows:—

|        |                                         |
|--------|-----------------------------------------|
| 1924-5 | 330 million gold marks.                 |
| 1925-6 | 465 million gold marks.                 |
| 1926-7 | 550 million gold marks.                 |
| 1927-8 | and thereafter: 660 million gold marks. |

Behind the bonds there were to be created:—

- 2 milliards of preference shares to be reserved for sale to the public and
- 13 milliards of common stock.

Three-fourths of the proceeds of the preference shares was to be applied, as required, to the payment of debt and for capital expenditure of the railways. The remaining 500 millions of preference shares and all the common shares were to go to the German Government. They assigned the Transport Tax to the extent of the first 200 million gold marks for reparations. Industrial debentures were recommended: Five milliards of industrial debentures were to be provided for reparation; these bonds to bear 5% interest and 1% sinking fund, i.e., 300 million gold marks per annum. Pending economic restoration, interest and sinking fund were to be accepted as follows:—

|             |                         |
|-------------|-------------------------|
| First Year  | Nothing                 |
| Second Year | 125 million gold marks  |
| Third Year  | 250 million gold marks. |
| Thereafter  | 300 million gold marks. |

As further guarantee, they proposed to pledge certain revenues as collateral security, i.e., the taxes on alcohol, tobacco, beer and sugar, and the customs, but only up to definite limits. An arrangement for control, simple in the ordinary course, but becoming drastic if circumstances demanded, was recommended.

The new organisation therefore required a trustee for railway and industrial bonds, three commissioners of (1) railways, (2) the bank, (3) controlled revenues, and they recommended an agent for reparation payments to co-ordinate the activities of the above and to preside over the transfer committee. The feature of the plan on which its whole inception depended was the raising of a foreign loan of 800 million gold marks, which had to serve the double purpose of a gold reserve and also financing the internal payment for the Treaty in 1924-5. The report claimed to take the question of "what Germany can pay" out of the field of speculation and put it in the field of practical demonstration.

#### IV. ADOPTION OF THE REPORT

The reception of the report was immediately favourable, and it was finally adopted by the Governments concerned in the London Agreement on Aug. 30 1924. Steps were immediately taken to put it into operation. So far as all formal acts and the setting-up of the machinery for the future working of the Plan are concerned, it may be said that everything has gone satisfactorily. The Reparation Commission have officially stated: "Germany is faithfully fulfilling her reparation obligations as far as they are at present fixed." The actual test of the working of the full apparatus will come later, since the reparation payments to be made by Germany in its early stages are comparatively negligible. That a new spirit has been secured is beyond question. The first report of the Agent-General, Mr. S. Parker Gilbert, says:

It is too early to draw conclusions regarding the ultimate effects of the Plan. Broadly, it is an endeavour to stimulate confidence among peoples and to apply principles of reason and justice to a difficult, vital problem. The success of the Plan will be measured not alone in terms of payments effected. It will be determined also by the extent to which it helps to replace distrust and discord with confidence and conciliation. Its early operation has fulfilled expectations.

The pivot of the whole Plan for the first year was the German External Loan of 40 millions sterling or 800 million gold marks. In the words of the report, this was necessary to assure currency stability and financing essential deliveries in kind during the preliminary period of economic rehabilitation.

It enabled the Allies to receive something on account of reparations without, at the same time, any burden being placed upon the German budget. Negotiations were completed on Oct. 10 1924, and on Oct. 13, the Reparation Commission constituted the service of the loan as a first charge on all the payments provided for under the Plan, and also on the collateral security of the controlled revenues, and any other assets or revenues of Germany to which the powers of the Commission extended under the treaty. The transfer committee at its first meeting recognised

| Receipts                                                   | Million Gold Marks | Payments                                                                                                         | Million Gold Marks |
|------------------------------------------------------------|--------------------|------------------------------------------------------------------------------------------------------------------|--------------------|
| Cash withdrawn from proceeds of German External Loan, 1924 | 800.0              | Payment to various Allied countries                                                                              | 789.0              |
| Interest on railway bonds                                  | 200.0              | Expenses of:                                                                                                     |                    |
| Exchange differences and interest received                 | 0.5                | Reparation Commission                                                                                            | 5.6                |
|                                                            |                    | Rhineland High Com.                                                                                              | 9.4                |
|                                                            |                    | Military Com. of Control                                                                                         | 7.7                |
|                                                            |                    | Naval Com. of Control                                                                                            | 0.07               |
|                                                            |                    | European Commission of the Danube                                                                                | 0.2                |
|                                                            |                    | Service of German External Loan                                                                                  | 77.5               |
|                                                            |                    | On account of administration cost of office for reparation payments, and discount on railway payments in advance | 3.9                |
|                                                            |                    | Cash in hand, Aug. 31 1925                                                                                       | 107.0              |
| Total                                                      | 1,000.5            |                                                                                                                  | 1,000.5            |

the priority of the loan, and gave it an absolute right of remittance irrespective of the effects upon the exchange. This loan provided 800 million gold marks out of the total of 1,000 million gold marks, which constituted the first year's annuity, and the balance of 200 million gold marks came from the German Railway Company as interest on the bonds. Apart from this 200 millions, there was no drain whatever on the current resources of Germany for the first year.

*First Year's Working of the Plan.*—The first complete year of the Dawes scheme is shown in the preceding table of receipts and payments.

The distribution of the 893.5 million gold marks includes 48.6 million gold marks for miscellaneous deliveries to the smaller claimants, leaving 740.4 millions for the four chief interests distributed as follows:—

|                                                   | (Million Gold Marks) |           |          |            |                   |
|---------------------------------------------------|----------------------|-----------|----------|------------|-------------------|
|                                                   | To Great Britain     | To France | To Italy | To Belgium | Total 4 countries |
| Arising on account of Reparation Recovery Acts    | 155.2                | 25.1      | ..       | ..         | 180.3             |
| Cost of Armies, requisitions, etc.                | 30.2                 | 144.2     | ..       | 20.7       | 195.1             |
| Delivery of dyestuffs, etc., and receipts in kind | 4.5                  | 227.3     | 60.4     | 72.8       | 365.0             |
| Total                                             | 189.9                | 396.6     | 60.4     | 93.5       | 740.4             |

Thus 49% has been transferred as deliveries in kind, 26½% for occupation expenses, and 24½% has been forthcoming from the Reparation Recovery Acts.

France has received 50%; Great Britain (including the Dominions), 24%; Belgium, 12%; Italy, 7½%, and other Allies, 6½%. Under the Agreement of Jan. 1925 the United States are to get 2½%, to be contributed proportionately by the other participants.

The transfer committee have had time to examine their problem before having to take any executive action on its chief difficulties. They have not been called upon to decide delicate questions of exchange priority or pressure. Their first year has been taken up in making arrangements for deliveries in kind and Reparation Recovery Acts. The latter in particular presented difficult questions which have been described by the Agent General in his report. By forcing the German exporter to look to the German Govt. or Agent General for the deductions made by the British Govt., in respect of a total which had no relation to the Dawes Plan or to the sums transferable by the transfer committee, the British Govt. could virtually ride round the powers of the committee, "confronting them with an accomplished fact."

In the report of the negotiations between the British Treasury and the Agent General, it was arranged for the German exporters as a whole to deliver to the Reichsbank monthly 30% of the sterling proceeds of their exports to Great Britain. Deposits are made at the Bank of England for credit to the Agent General's account. The transfer committee regains control and the system adjusts itself automatically to the British Govt.'s share in the available annuity.

Towards the end of 1925 Germany passed from a stage of comparatively easy conditions into an industrial crisis which may retard the full development of her fiscal resources towards the position demanded by the third year of the Plan.

#### V. THE INDUSTRIAL ASPECTS OF REPARATIONS

It has been increasingly realised by the industrialists of the Allied nations that, just as the payment of reparations by Germany involved the necessity for her to maintain an export surplus, so the recipient countries may derive all they need of the goods involved by imports from Germany at the expense of the competing industries in the Allied countries, and that even if the surplus of German goods should go to neutral markets they may serve only to displace similar goods hitherto exported from the Allied countries. Hence the anomalous situation has arisen that reparation payments, speaking generally, have been ardently desired by the creditor governments, but speaking

particularly, have been feared and resisted by the business men in the same countries.

The Committee on Economic Restoration of the International Chamber of Commerce in Nov. 1924 set up a sub-Committee (Sir Josiah Stamp, Dr. Alberto Pirelli and Count André De Chalender) to study the question of international transfers of reparation payment. One report signed by all three, and a supplementary one by the English member, were presented in May 1925, and adopted at the conference in Brussels in June 1925. The chief items and recommendations were:—

The solution of the "balance of trade" problem in relation to the liabilities under the Dawes Plan, is to be found in the following order:—

1. By a considerable expansion of German exports to general world markets in the ordinary course and under those conditions normal to Germany without any special overhead organisation or effort. This carries with itself the possibility of cash payments to the Allied Govts., which is, of course, the ideal form for the latter of receiving reparation payments.

2. By arrangements between each allied creditor country and Germany with a view of developing, in the widest possible manner compatible with national interests and the obligations of the transfer committee, deliveries in kind or services. This, though possibly in the long run not a major part of the total, is important. Serbia may want locomotives which she does not produce. Italy may want coal which she may not possess, France or Great Britain may want dyestuffs or potash. These are merely examples of a wide range of goods which Germany can probably deliver without difficulty.

3. By the operation of certain international co-ordination in enterprise and public works, by research and study and practical action, of which we have in this report, given an illustration called "Assisted Schemes."

4. Where the three foregoing still leave a gap between the accumulation of reparation marks and their effective transmutation into external values, it may be possible to gain time and to defer the greater difficulties of forcing the Plan by two methods (a) The sale of railway, industrial and eventually other German bonds on the international markets and (b) by making permanent investments in Germany which will belong to non-Allied or neutral holders. The method (a) above may play a very important part, either as redemption of capital debt or for the balance of the annuities. It must not be forgotten, however, that the extensive use of the plan throws a burden upon the future export surplus in addition to the fixed annuities. The system under (b) finds certain limitations under the Dawes plan and in practice, but it may be e.g., that an Argentine resident or a Brazilian will become the owner of property in Germany, or of shares in German companies, by means of the export of food or raw materials to Allied individuals. These sales, as also these loans, are not an immediate method of externalising German wealth, but they, so to speak, stave off the day of difficulty and gain time. The difficulty of exporting £1,000 outright is transmuted into the smaller difficulty of transferring £50 or £60 interest thereon annually in perpetuity, a difficulty capable of retransmutation into capital at some distant date after the export surplus is no longer monopolised by reparation payments, by Germans buying in the investments held by foreigners in their own country.

While theoretically the "demand" of individuals in the Allied countries will be so increased by relief in taxation that it could, *in amount*, absorb a new supply of German goods, the demand will not fully coincide *in kind* with the goods which are offered. There may be, in consequence of this maladjustment, important reactions in price which will make the burden greater for Germany to discharge, make full transfers difficult, and induce unduly severe competition in certain markets. Moreover, vested industrial interests in both capital and labour in the Allied countries may be adversely affected, and for various reasons, if the whole question is left to uncontrolled economic forces political difficulties will arise.

We have certain suggestions to make for co-ordinated and systematic international action which, while it may not affect a large sum in relation to the whole reparation annuity, may be of great importance in assisting a settlement of this *residual problem*. We conceive that there is everything to be gained by systematic study and the existence of a "safety valve" in the event of normal channels being inadequate for the purpose, to relieve the concentrated competition, and also to prevent the consequences of accumulation of reparation payments in Germany. Our proposal would tend to prevent existing channels of German trade being flooded by excessive supplies and by a prepared plan irrigate, without disaster and with ultimate profit to the world, a wider area than could otherwise be open.

The International Chamber have decided to prosecute the idea of assisted schemes, and are setting up an organisation to elaborate them.

As soon as the Dawes Scheme has had time to operate, it will be seen whether "transfers" on the basis suggested are practi-

cable or not. In any case, it is anticipated that the question of the total amount on the duration of the reparation scheme will again come forward for consideration, and the difficult diplomatic questions relating to so-called "modifications of the Treaty" will have to be settled.

Various pamphlets on the Dawes Plan and kindred matters have been published by the World Peace Foundation. (J. St.)

**REPERTORY THEATRE:** see DRAMA.

**REPIN, ILJA JEFIMOVICH** (1844–1918), Russian painter (see 23.105), died at Knokkala, on the Finnish frontier, July 17 1918.

**REPPINGTON, CHARLES A. COURT** (1858–1925), British military critic, was born Jan. 29 1858 and commissioned in the Rifle Brigade in 1878. After serving with distinction in the Afghan War, the Sudan and South Africa, he was appointed military attaché at Brussels and the Hague in 1900, being then a lieutenant-colonel. Two years later his military career ended abruptly through domestic causes, and he took up journalism, becoming military correspondent of *The Times* in 1914. His resignation was a loss to the Army, for his abilities had marked him out for high command, but in his new sphere he was able to render notable services to the cause of national security, and was also several times employed on delicate missions abroad. In 1911 he was appointed editor of the official *Army Review*, but as he retained his post on *The Times* the appointment aroused parliamentary criticism and was terminated in 1912. In 1915, after staying with the British commander-in-chief in France, he came home to call attention to the shell shortage. In Jan. 1918 a divergence of views caused him to leave *The Times* for *The Morning Post*, and after the War he became military correspondent of *The Daily Telegraph*, a post which he held till his death at Hove, Sussex on May 25 1925. His works include *Vestigia* (1919); *The First World War, 1914–8*; *Personal Experiences* (1920); *After the War; A Diary* (1922); *Policy and Arms* (1924).

**REPUBLICAN PARTY** (see 23.177).—From 1897 to 1911 the Republican party was in control of the Federal Govt. of the United States. It had settled the "battle of the standards"—gold *v.* silver—by placing the country on a gold basis, and had conducted the Spanish-American War to a successful conclusion, though with some scandals in the War Department. In dealing with the resulting question of over-seas imperialism and colonial administration and still more in handling the problem of the tariff, conservation, railways, monopolies and trusts, it had alienated part of its following, particularly in the agrarian northwest. Since 1911 the history of the party falls into two periods. During the first of these it lost control first of the House of Representatives (1911), then two years later of the Senate and the presidency, remaining wholly a party of opposition to the dominant Democratic administration until 1919. The second period witnessed the restoration of the Republican party to power, first in the Senate and House (1919) and two years later in the presidency. Since 1921 the Republicans have controlled without interruption all branches of the Federal Government.

The period of exclusion from power was preceded by a party split caused by the bolt of Roosevelt and the formation in 1912 of the Progressive party (*q.v.*). By 1916 the Republicans were again united, superficially at least. The Democratic administration under President Wilson, however, had dealt with domestic problems boldly and on the whole successfully. On the questions raised by the World War both parties were non-committal. Former Supreme Court Justice Hughes, the Republican nominee, lost some support, particularly on the Pacific coast, by tactical errors and was defeated by a narrow margin, his vote in the electoral college being 254 to 277 for Wilson.

During the participation of the United States in the World War the activities of the Republican minority as an opposition

party were, of course, largely subordinated to the common purpose of winning the War. Nevertheless intense antagonisms were developing. When in Oct. 1918, President Wilson appealed to the country for the return of Democratic majorities to the Senate and House, his action was bitterly denounced by Republican leaders as inconsistent, as revealing dictatorial inclinations and as reflecting unworthily upon the motives of the party. In the ensuing congressional elections the Republicans gained control of the House by 46 votes and of the Senate by a plurality of one.

With the Senate once more in their hands the Republicans, not without the aid of certain Progressives and dissenting Democrats, succeeded in defeating the policies of President Wilson, who favoured ratification of the Treaty of Versailles and the adhesion of the United States to the League of Nations. As a result the latter question became the paramount issue in the campaign of 1920. Undoubtedly many Republicans favoured the league with reservations, while many others were bitter-enders. By an adroitly drawn platform plank the adherence of nearly all these divergent elements was secured. It was now the turn of the Democratic party to suffer from the accumulated errors and mischances of a long lease of power. War taxes and burdens, industrial dislocations, high prices and the national feelings of foreign-born voters contributed to swell the Republican tidal wave. In the Nov. election Harding and Coolidge, the Republican nominees, received the enormous popular plurality of seven million votes and carried the electoral college by 304 to 127 votes over the Democratic candidates James M. Cox and Franklin D. Roosevelt.

President Harding's administration made a separate peace with Germany and conducted a successful Conference for the Limitation of Armaments, in Washington. It was marred, however, by grave administrative misconduct, as a result of which three of his Cabinet appointees were forced later to resign. Upon his death in 1923, Vice-President Coolidge succeeded. Both Harding and Coolidge represented the more conservative wing of the Republican party and hence were attacked by leaders of the agrarian element. Under LaFollette the latter element broke away again in 1924, organising a second Progressive party movement 12 years after the first. In their platform for 1924 the Democrats severely criticised Republican "dishonesty, discrimination, extravagance and inefficiency"; and proposed a referendum on the League of Nations. They suffered, however, from internal dissensions between Klan and anti-Klan factions and from bitter rivalries for leadership, which had caused a long-drawn-out contest for the nomination at their New York convention.

The Republican party nominated Calvin Coolidge at its Cleveland convention and adopted a platform favouring the adherence of the United States to the Permanent Court of International Justice, but reaffirming the stand taken in 1920 against the League of Nations. It pledged further reductions in taxation, reasserted belief in protective tariffs and declared for settlements with all debtor countries similar to the debt agreement made with Great Britain. The election of Nov. 1924 gave the Republican candidates, Coolidge and Dawes, 382 votes in the electoral college; the Democratic candidates, Davis and Bryan, 136; and the Progressive candidates, LaFollette and Wheeler, 13. The Republican popular vote exceeded the combined vote of the two other parties by more than two millions in a total poll of nearly thirty millions.

**RESEARCH, INDUSTRIAL.**—The phrase was hardly known at the beginning of the 20th century, and now it is widely used as a panacea for the troubles of a world struggling to renewed life and strength. Mr. Stanley Baldwin, speaking in the House of Commons in June 1925, said that one of the essential steps in the endeavour to find a way out of our present difficulties is "to link up science with our industries" and of this chain industrial research forms many links. It aims at applying to industry the truths wrested from nature by workers in science. For research in the world of medicine see **MEDICAL RESEARCH**.

In 1893 Sir Wm. Anderson wrote "The days are past when an engineer can acquit himself respectably by the aid of mother

wit alone or of those constructive instincts which in the past led our predecessors to such brilliant results." Each year makes the truth of his words more manifest; industrial research is one important stone in the foundation of our modern civilisation.

But appreciation of this truth has been slow of growth, at any rate in England. In Germany during the later years of the 19th century the Reichsanstalt and the Materials Prüfungs Amt were founded, and their work, along with investigations at technical institutes, had no small effect on German industry. The beginning of the 20th century saw the establishment of the National Physical Laboratory in Great Britain, followed almost immediately by that of the Bureau of Standards at Washington, while in Paris there was the Laboratoire Central d'Électricité and much renewed activity at the Laboratoire d'Essais in the Conservatoire des Arts et Métiers.

The seed had been sown, but it took time to germinate; for years the harvest was scanty and men attached but little value to the crop; it needed, as we shall see, the shock given by the World War before the truth of Sir Wm. Anderson's words was fully grasped. Scientific research has for its object the explanation of some natural phenomenon, or the discovery of some natural law. "How does it go?" was a question continually in the mouth of the future Kelvin when a boy, and to discover, for the mere pleasure arising from the discovery, how something works is sufficient reason for the natural philosopher. To apply this knowledge to manufacture or industry is a further step, and when the discovery is sought or the investigation made with such an object in view the research becomes industrial. Industrial research does not necessarily differ from so-called pure research in its methods; it is the object with which the investigation is made that constitutes the difference; and of course much work is necessary—a great part of which may fairly be called industrial research—before the laboratory discovery, or the brilliant intuition of the inventor, verified by striking experiments, can be translated into the practice of the farm or the factory.

*Mendel's Work.*—It was the desire for knowledge, research pure and simple, that led the Abbé Mendel in his monastery at Brunn to unravel some of the laws of heredity by crossing various kinds of peas. When, at an agricultural institute, the laws that he discovered and the methods he employed are utilised to improve the breed of cattle or to produce new and more valuable forms of wheat, the research has become industrial.

*The Structure of Matter.*—At present physicists in many countries are investigating the properties of matter by X-ray analysis, determining the forms of lattice in which the atoms which constitute the substance are arranged and endeavouring to draw conclusions applicable to all matter; this is a great work of pure research. The metallurgist employed in some works or in an industrial research laboratory seeks to use the results of the physicist and the methods which have been devised as a tool to enable him to learn, for example, why steel is hardened by quenching, what is the cause of the deleterious effect of phosphorus on copper, or why cast metal which is brittle can be made soft and ductile by heat treatment and mechanical work. This is industrial research. Such a worker must carry his investigations further in order that they may be of use to industry. In his works laboratory some method devised for making and treating a new and valuable alloy works perfectly or some instrument designed to register the course of a factory process appears fool-proof and without a fault; in the factory the alloy cannot be worked or the instrument fails under the first real test; it is his business to find out why; to make the advances of science—advances due in part to his own researches—available for industrial purposes, to transform his work into the dividends that repay the shareholders and are necessary if the enterprise is to succeed.

Here a distinction should be drawn between the research laboratory of a works and the works laboratory; where both exist there may well be close co-operation and possibly joint control, but the spheres are distinct. In any modern factory a works laboratory of some sort is essential, to check the purity of

the materials employed and to ensure that the product is up to standard; an engineering works will have its chemical laboratory for this and similar purposes, its testing laboratory where the strength and character of its manufactures are sampled before they are put upon the market; but such work is not research; though it often may indicate where research is necessary, and lead up to original investigations of high value to the firm.

The works manager knows that for success the temperature at some point in a complicated process must be kept within narrow limits, whereas during other operations large variations of temperature have little effect. Samples which fail come to the works laboratory for examination, and inquiry shows that the temperature limits at this critical stage have been exceeded. Such an occurrence naturally leads a competent chemist to inquire what is the nature of the action which takes place at this critical temperature; how does the product produced, when the temperature limits are over-stepped, differ from the proper article? This inquiry may lead to a long and intricate investigation with results of the utmost importance to the firm. It may be found, for example, that a slight change in the composition of the material will render the close limits unnecessary and will reduce greatly the care and attention required for the manufacture. The problem has become one for industrial research, not merely for routine testing, and the consequences of that research have proved to be simplification of manufacture and cheapening of the product.

*British Problems.*—In Great Britain nearly 50,000,000 people must be supplied with food, mostly brought from beyond the seas, and this food must be paid for with the products of industry at home, by the goods manufactured in great part from materials purchased from abroad but dependent on the coal and iron of English mines and by the knowledge and skill of English manufacturers. It is of the utmost importance that the high quality of those goods should be maintained, the methods of their manufacture improved and the costs of production reduced. In the words of a recent report: "Scientific and industrial research is an essential factor in the national effort on which the continued maintenance of our present population unquestionably depends." And these words, though used here for England, apply to the other nations of the world as well.

#### PROGRESS AND PRESENT POSITION

And now, leaving the discussion of the meaning of industrial research and its importance to any national community, we come to the consideration of the means taken to promote it and of its present position and work in various lands.

*State Organisation.*—These means are various; the state in a number of instances has organised research laboratories devoted mainly to industrial problems; large private firms have recognised its value and have established similar laboratories under their own control, while attempts have been made by the formation of research associations to combine the efforts of a number of firms concerned in the same industry. The universities, too, and technical colleges have aided the endeavour by organising more fully the teaching of science and giving facilities for the training of research workers.

*German Developments.*—It needed a catastrophe to produce the results which have been attained. The Reichsanstalt in Berlin was a direct outcome of the War of 1872. Established in two divisions, the one devoted to pure science, the other to its applications, its founders realised the close interdependence of the two, and while the first division dealt to a large extent in questions bearing on the fundamental units and standards of measurement whether in heat, electricity, light or any other branch of physics, the second division was concerned mostly in the application of the principles which resulted from these investigations to the advancement of German industry and manufacture.

At the same time technical colleges were established in a number of centres; of these, perhaps the colleges at Charlottenburg and Darmstadt were the most important, and from their professors and students came a stream of scientific facts and discoveries, many of great value to industry, which were eagerly

seized upon and assimilated by men at the head of great industrial concerns who had realised that science was the foundation of their success and that without its help the place in the sun of which they dream could never be attained.

In their own factories these men were no less active and far-seeing. Charlottenburg and the Materials Prüfungs Amt at Grosse Lichterfelde which developed from it taught the engineer and the metallurgist the value of research. Its professors devised delicate instruments for use in investigating the properties of materials; the Martens Extensometer is an example. Sorby, of Sheffield, in 1864 was the first to investigate the structure of metals and alloys by the aid of the microscope, but his work was not pursued until, at a later date, Osmond in France and Martens in Germany took up the study independently and showed its importance to the industrialist.

In electrical science, also, the work of the Reichsanstalt had a marked effect and the great electrical firms—the Allgemeine Electricitäts Gesellschaft, Siemens and Halske and others—established research laboratories to develop for their own purposes and private benefit the results of scientific investigations.

Nor should the great chemical firms be forgotten. Perkins, in England, was the founder of the modern dye industry, but it was in Germany that this teaching first bore practical results. The Badische Anilin Fabric and other similar works were founded and huge sums were spent in developing new methods and inventing new dyes. Artificial indigo took the place of the natural product, with the inevitable result to the Indian industry. Germany had learned the lesson, and industrial research promised, unless other countries woke up, to give her the leading position among the manufacturing nations of the world.

*The National Physical Laboratory.*—In England, until towards the end of the 19th century, the danger was hardly appreciated. At meetings of the British Assn. and elsewhere, Lodge and others had pointed out the value of the Reichsanstalt to Germany, the need that England should have a similar institution. In 1900 the National Physical Laboratory began in a small way—the expenditure during the first year was £5,479—in the old buildings of the Kew Observatory at Richmond. In 1901 the work was transferred to Bushy House, Teddington, with a staff of eight scientific assistants and six attendants in addition to the director. The scientific character of its work was secured by placing the ultimate control in the hands of the Royal Society, while a close connection with industry was maintained by having representatives of the great engineering societies on its governing body. The laboratory, at the time the only public institution in the country devoted to the application of science to industry—to industrial research—grew slowly and prospered for the next 12 or 14 years, and when the World War came, it was in a position to be of material service to the country.

*British Engineering Standards Committee.*—About the same time, the British Engineering Standards Committee was founded, chiefly at the instance of Sir John Wolfe Barry, who had realised the loss caused by the infinite number of standards used by engineers and the advantages to be gained by a system based on accurate measurement and a careful investigation of the properties of the materials which they employed. In this work the National Physical Laboratory co-operated very fully. Meanwhile at an earlier date industrial research of importance had gone on in a few laboratories attached to firms in Sheffield and elsewhere. The work of Sorby on the micrographic structure of metals has already been referred to and at a later date Roberts Austen of the Mint utilized this method of inquiry in his investigation of a broken rail which had led to a serious accident at Abbots Ripton on the Great Northern Railway. Manganese steel was produced from the laboratory of Sir Robert Hadfield in 1882 as an outcome of a scientific inquiry into the properties of alloys; many results of high value have since come from the same source.

*Developments in France.*—In France, work of value was being done in various places; the Laboratoire d'Essais and the Laboratoire Central d'Electricité both contributed. The metallurgical work of Osmond and Le Chatellier was of marked importance,

while the discovery of the special properties of Invar—an alloy of nickel steel—by Gulleaume has proved of value in many industries.

*International Standards.*—One of the marked consequences of industrial research has been the realisation of the importance of international standards of measurement, and as a result international co-operation between the standardising laboratories in various countries and other bodies concerned with standards has become necessary. From this need arose the Bureau International des Poids et Mesures at Sèvres and various international associations such as the International Electrotechnical Assn. or the Assn. for Testing Material. In 1908 the British Govt. summoned an International Congress in London at which the system of electrical units, now universal throughout the world, was adopted.

In America the Bureau of Standards was founded early in the 20th century and many striking results have followed from the investigations of its staff. America has ever been foremost in promoting international standardisation and most generous in affording opportunities for co-operation in research. There, too, the development of research laboratories in connection with the great manufacturing firms has reached an extent unknown elsewhere.

*War Problems.*—In 1914 came the earthquake, and from the ruins which it left has sprung a wider appreciation of the importance of scientific investigations in every phase of national life. This is not the place to give any account of the influence of science on war; experience showed it to be vital and the phrase that Science won the War, interpreted to mean that without science the War would have been lost, only expresses the truth.

In the Allied countries on both sides of the Atlantic, men and women were at work solving problems of vital importance. Facilities for research were open to them, funds undreamed of in peace time were at their disposal, and the results of their endeavours contributed to a more general acceptance of the view that in peace time industry would benefit in the same way from scientific inquiries wisely guided and pursued. And so, in Great Britain as elsewhere, a movement started to organise in some more definite way the connection between science and industry. The establishment of the Dept. of Scientific and Industrial Research was the outcome of this movement. This was announced by Lord Crewe, Lord President of the Council, at the end of 1916 in reply to a deputation from the Joint Board of Scientific Societies headed by Sir Joseph J. Thomson. An advisory council of scientific men was established and the sum of £1,000,000 was placed at the disposal of the department to be used in the application of science to industry.

The financial responsibility for the National Physical Laboratory, with a staff which before the end of the War had grown to 600, was transferred to the department; boards were set up for fuel research, food investigation, building research and various other subjects, while a number of co-ordinating bodies were established to deal with researches of importance to Government departments, specially those bearing on industry. These researches are carried on either in special laboratories or at one or other of the national laboratories; the Geological Survey and Museum became one of the activities of the new department, which thus undertook the task of guiding and supervising the various official agencies for making the advances of science of service to national progress.

*Co-operative Research.*—But the department has done more than this. In Germany and America many of the great industrial firms have their own research laboratories; reference has already been made to some of the results on German industry. But research laboratories are costly; in many industries in England the firms concerned are small, a private research laboratory is too expensive to be contemplated, besides a number would produce wasteful overlapping. Hence the attempt was made to introduce a system of co-operative research. In an effort to lead manufacturers to rely more on scientific results, research associations have been set up. Each of these consists of a body of men engaged in the same industry who associate themselves for the purposes of research bearing on their industry. Each

association has its own director of research, or similar official, under whose guidance the work planned by its council is carried on either in their private laboratory or by arrangement at the National Physical Laboratory or in the laboratories of some university or technical college.

The work is financed in part by the associated firms, in part from the million fund, usually on a pound to pound basis guaranteed under certain conditions for five years and with a limit of £5,000 a year to its amount. In 1926 there were 21 such associations in existence and the balance in the million fund is £518,200; a substantial part of this is required to complete the payments already promised. In a number of cases the first five years for which the grant was made have elapsed and the department, with a view to determining its future course, has arranged for a report from some independent body on the work and progress in each case. In a recent report to the committee of the Privy Council responsible for the work of the department, the advisory council writes:—

The reports supply much encouraging evidence of the soundness and utility of the scheme for co-operative research and of the advances which have been made under the scheme in the application of scientific research to the technical problems of industry.

It is clear, however, from their general tenor that five years is insufficiently long even under the most favourable conditions to set a research association on its feet and make it independent of government assistance. To devise a programme, collect an efficient staff and obtain results all take time. Besides there is much educational work to be done; half-hearted supporters need to be converted by results before they will contribute freely; trade rivalries tend to prevent complete co-operation; trade has been bad and returns barely sufficient to keep old ventures going; there has been little to spare towards an expenditure of whose value the manufacturer is only half convinced. And so the department has now under consideration the steps that can be taken to maintain the work for some years to come and, in the case of some important associations, has already settled the terms of future grants.<sup>1</sup>

*The Training of Workers.*—But there are other ways in which official support is being given to industrial research, and among these the schemes for training research workers is most important. Under this scheme young graduates are assisted to carry out researches under the guidance of some competent professor, while, in a number of cases, funds have been granted to prominent workers to enable them to pursue inquiries of importance. The department also aids the work of the Aeronautical Research Committee which—at first as the advisory committee for aeronautics—has contributed in no small degree to the science of aviation. The royal commission for the exhibition of 1851 administers for the advancement of education and research funds arising from the balance left when the exhibition closed. For many years past its scholarships and studentships have been of great value to students of science. The commission has inaugurated a number of Industrial bursaries given on the recommendations of the universities and technical schools to men trained in science who were prepared to enter, as apprentices or students, engineering or other works. In this way, a stream of trained workers in science is provided for industry.

*Private Research Laboratories.*—Before concluding, reference should be made again to the research laboratories of prominent firms; in England, the laboratory of the General Electric Co. at Wembley occupies a leading place; but it is to Germany and America that we turn for striking examples of what a works research laboratory can do. Such laboratories are essential to mass production; in this the results no longer depend mainly on the skill and intelligence of the workman, but on his performance of one of a carefully devised series of operations worked out as the result of researches in the laboratory and investigations of highly trained engineers and physicists. Thus, to quote from a book in which the laboratory of the General Electric Co. at Schenectady, N. Y., is described, we read:—

<sup>1</sup> Particulars will be found in the reports of the department for 1923-4 and 1924-5 published by H. M. Stationery Office, London.

This laboratory is not concerned primarily with the solution of works problems or with investigations on the manufacturing problems of the company; it has deliberately sought entirely new discoveries, new applications of material and new developments in the art of electricity. From it have come the metallised carbon and the drawn wire tungsten filament lamp, the nitrogen-filled high-efficiency lamp, the magnelite arc lamp and the Coolidge tube.

The development of each of these has involved investigations of great importance to science, while among the workers at the problem, which of all others is now arousing the interest of the physicist, Dr. Langmuir, of the G.E.C. laboratory, is a leading figure. Much the same might be written of other works research laboratories in America; it is sufficient to mention the Pittsburgh laboratories of the Westinghouse Co., the laboratories of the Western Electric Co. at New York, or of the Kodak Co. from which has come the work on light filters and other investigations which have been of the utmost value to the photographer.

(R. T. G.)

*United States.*—With the cumulative benefits of the preceding century upon which to draw, natural resources unexcelled in variety and extent, and the demands of the World War as a stimulus, it was to be expected that the period 1910-26 would see in America the deepest interest in and most amazing results from industrial research. In whatever direction one turns these results are apparent, although progress has not been uniform in all industries.

#### A SUMMARY OF WORK DONE

Naturally, most attention has been given to the fields of immediate importance. Studies in the cracking of oil have doubled the available supply of gasoline and promise methods for completely converting crude oil into motor fuel with a little by-product coke. Motor fuels with anti-knock properties have been developed, and a way devised for winning the bromine required for one of them from the sea. The service life of tires has been greatly increased, thanks to research on accelerators for vulcanisation, on rubber compounding and on tire fabrics.

Progress has been made in the preparation and use of industrial gases—hydrocyanic acid as a fumigant, argon for incandescent lamps, carbon dioxide for "dry ice," and acetylene, hydrogen and oxygen for metal cutting and welding. Refrigeration for household units by compression or absorption is a recent research product. Chromium as a metal for plating, the perfection of alloys, the anticorrosion studies and research on the fatigue of metals are all important. Not only has radio developed from work on vacuum tubes, but the possibilities in other directions using such tubes as power control valves are being studied. Unique products in nitrocellulose lacquers, improvements in artificial leather and in rayon, all indicate activity in cellulose chemistry. Paper pulp has been made from cotton linters available in quantity since the World War. Insecticides and fungicides have been made from war gases, and progress has been made in the use of excess chlorine. America has developed a source of potash, established a fixed nitrogen industry and devised furnace methods for the manufacture of phosphoric acid, all as results of industrial research. Attention has been given to power generation, a kilowatt now being obtainable for each pound of coal burned. Low temperature carbonisation is an active research subject. Research in electrical insulation, on alloys for telegraphic and telephonic communication, and for power transmission has been successful. Synthetic resin is a distinct research product.

Such food staples as bread, meat and milk are now the subject of intensive research. The hydrogenation of oils has been perfected and commercial sources of new sugars seem assured. Crystalline dextrose is already used by the ton. Furfural, an aldehyde used as a solvent and substitute for formaldehyde, results from research upon waste agricultural products. Cutting tools of chromium, cobalt and tungsten which hold the cutting edge even when white hot afford a further example.

Perhaps industrial research has been most active in the synthetic organic chemical field, where America in the period 1910-26 has accomplished phenomenal results. The list of dyes, medic-

inals, perfume bases, flavours, photographic chemicals, etc., of coal-tar origin is now sufficiently extensive for American needs. Research has also turned successfully to natural gas and petroleum as sources of new and important compounds. A new group of solvents is now available. Resistance glass for commercial installation and developments in glass-blowing and control by machine deserve mention.

However, the significant things in industrial research in America are not the list of accomplishments, which could be indefinitely extended, but rather the attitude of industry toward research, both pure and applied. It is encouraging to find a growing realisation that in science there lies future security, that the great waste problems cannot be solved without it, and that only through research can the true conservation of natural resources be practised. Research facilities have been made available for the small manufacturer who wants only the occasional advice of the consultant, as well as for the great organisation appropriating millions for research and employing 1,500 scientists. There are now more than 500 industrial research laboratories in the United States with annual budgets aggregating more than \$35,000,000. In addition many firms support fellowships and join in co-operative work. There is a growing number of research professorships, fellowships and studentships, an increase in co-operation between industry, university and government laboratories, and more than 40 trade associations support research as one of their major activities. There has come about a general acceptance of the fact that fundamental research must be encouraged and supported if industrial progress is to continue. Industrial research in America therefore not only points to its accomplishments in the period 1910-26, but is so ordering its affairs and gathering strength as to indicate even greater things in the immediate future. (H. E. H.)

**RESIN:** *see* COAL TAR PRODUCTS; SYNTHETIC RESIN.

**RESPIRATORY SYSTEM, DISEASES OF THE** (*see* 23.195).—

Some notable advances in the technique of diagnosis and in the means of treatment, both medical and surgical, of diseases of the respiratory system have been evolved in the present century. Many of them are still in the process of development, but the results so far obtained have been encouraging.

*Means of Diagnosis.*—Direct methods of investigation, so long familiar in regard to the mouth, pharynx and larynx, have been extended to the trachea and bronchi, by means of the bronchoscope. The trachea, the main bronchi and their principal subdivisions can now be directly illuminated and observed. The importance of this in regard to the presence of inhaled foreign bodies is obvious, but it has also proved helpful in connection with obscure pathological conditions of these tubes. A notable application of the same principle of direct illumination has been made by Jacobaeus of Stockholm to the pleura and lungs. To enable this to be done, an artificial pneumothorax (*g.v.*) is first established, whereby the lung retracts from the chest wall except where it is prevented from so doing by adhesions. At a suitable time after this, a small tube is inserted through an intercostal space under local anaesthesia, and a special instrument with electric light and a system of lenses is fitted into it. By this means a clear view of the state of the pleura and of the surface of the lung may be obtained. Small adhesions, preventing the complete collapse of the lung, in the application of the artificial pneumothorax treatment to various conditions, may be successfully divided. The method promises also to be helpful in the diagnosis of certain tumours of the lung and pleura.

Improvements in the technique of X-ray methods have greatly increased their value in diagnosis. Their use is now almost a routine matter in cases of obscure intra-thoracic disease. In the distinction between fluid in the pleura and solid conditions of the lung, in the diagnosis of the extent of the disease in tuberculosis of the lungs and to some degree in the assessment of its type, in the early recognition of tumours of the bronchi, lungs, pleura or mediastinal glands, X-ray investigation is invaluable, and sometimes indispensable.

A recent extension of their use in regard to the diagnosis of bronchiectasis or dilatation of the bronchial tubes is already

proving of great value. A measured quantity of lipiodol, a liquid substance opaque to the X-rays, is injected down the trachea, through the crico-thyroid membrane or directly in between two of the cartilaginous rings of the trachea, under good local anaesthesia, the patient usually being placed in such a way that the lipiodol goes chiefly into the main bronchus of the side it is desired to investigate. The lipiodol rapidly diffuses into the bronchi of that lung, and in an X-ray film taken shortly afterwards the bronchial tree and its abnormal dilatations, if present, are seen with extraordinary clearness and accuracy. Applications of an old method, the study of so-called "vital capacity" that is, the amount of air it is possible to exhale by a maximum expiration after a maximum inspiration, promise to give valuable information in diagnosis. The further developments of bacteriological and other laboratory methods in the period under consideration have been helpful but not dramatic in their results.

*Diseases of the Air Passages.*—An important function of the nose is to secure that the air reaches the lungs, warmed, moistened and filtered from micro-organisms. In this connection the importance of adequate treatment, either medical or surgical, of conditions causing nasal or pharyngeal obstruction and therefore leading to mouth breathing, has become more generally recognised. For the same reasons, the treatment of septic conditions in the nose and nasal sinuses is more commonly carried out. The value of scientifically devised breathing exercises is also more widely accepted. Such measures lessen the risks of catarrhal infections, and in young people prevent deformities of the chest with their attendant disadvantages. The use of the bronchoscope has proved to be of great value in the extraction of inhaled foreign bodies. In America, Chevalier Jackson of Pittsburgh has pioneered this method with brilliant results. By its means the majority of inhaled foreign bodies can be removed, and the serious and often fatal results so common formerly are obviated.

The use of vaccines (*see* VACCINE THERAPY) in the prevention of the "common cold" and the more serious forms of catarrh of the air passages has given encouraging results. It is usual to employ a "stock" vaccine, containing a mixture of catarrh-producing organisms. An autogenous vaccine, *i.e.*, one made from the patient's own infective organisms, is, however, sometimes employed. At present, however, these protective vaccines have not proved as generally effective as the use of antityphoid and antiparatyphoid vaccines in the prevention of the enteric fever group of diseases. With increasing knowledge of the catarrh-producing organisms, a somewhat large and diverse group, and of the conditions favouring their activity, greater success may be obtained.

*Bronchitis.*—The use of vaccines in treatment has proved somewhat disappointing, except in the form due to the pneumobacillus of Friedländer, though in chronic cases they are helpful.

*Gassing.*—The employment of irritant and poisonous gases in the World War largely increased our knowledge of their effects, and in some measure led to advances in means for the prevention of such effects and for the treatment of the resultant conditions occurring in civil life from accidental or occupational causes. Some of these, such as chlorine and phosgene, lead to oedema of the lungs; others, such as mustard gas, to acute bronchopneumonia; and others, such as carbon monoxide, to changes in the blood. Tuberculosis as a sequel of gassing has proved to be relatively infrequent, but severe chronic bronchitis and emphysema are common.

*Asthma.*—The idiosyncrasies of asthmatics are well known, and their susceptibility to the emanations of certain animals was long ago recognised by Hyde Salter. This peculiarity has found a rational explanation in recent work on anaphylaxis, or hypersusceptibility (*see* MEDICINE). Some, if not all, cases of asthma seem to fall into a group of toxic idiopathies—*i.e.*, disease conditions due to hypersusceptibility to certain foreign protein substances. These may be derived from animals, such as the horse, dog, cat, etc.; or from articles used as foods; or again they may be toxic agents produced by bacteria.

This aspect of the disease has been closely studied by Chandler Walker in America and by Fleming and Coke in this country. It was hoped that by testing the sensitiveness of the skin of asthmatic patients to large numbers of such substances, collectively called antigens, by means of scratches to which they are applied in solution, it would be possible to discover the particular agents to which the patient was susceptible, with a view either to avoiding contact with them if possible, or to desensitisation by inoculation with minute but increasing doses of the particular substances concerned. Some good results are on record, but on the whole this method has been disappointing. Probably hypersensitiveness is not the only factor in asthma, and there may be, in addition, an inherited or acquired instability of the centre in the brain controlling the innervation of the bronchi.

The non-specific method of treatment of hypersusceptibility called protein shock therapy (*see* THERAPEUTICS) has been extensively tried in this disease, with some benefit in certain cases, but on the whole also with disappointing results. Of medicinal agents, apart from the iodides and the antispasmodic group of drugs such as belladonna, stramonium, grindelia and lobelia, small injections of adrenalin or of pituitrin, alone or together, have proved most useful.

*Bronchiectasis.*—Bronchiectasis, or dilatation of the bronchial tubes, was for a long period almost the despair of treatment. The offensive character of the sputum, and the serious general effects of the septic and putrefactive processes which occur in connection with the retained bronchial secretion, renders this condition unusually distressing to the patient and to his friends. The course of these cases had been progressively downhill, and the result almost invariably fatal, often after years of suffering and incapacity. The application of surgical methods in suitable cases, if employed sufficiently early, seems to promise hope of real amelioration, or even of actual cure. In a small proportion of the cases, where pleural adhesion has not occurred, artificial pneumothorax may be sufficient; but, in the majority phrenicotomy or a more or less extensive thoracoplasty may be necessary. By these means the sputum may be lessened or entirely lost, and its offensive character ended.

#### DISEASES OF THE LUNGS

*Pneumonia.*—There are certain advances to record in regard to this disease. The study of the causal organism, the pneumococcus, by Ducheze, Gillespie and Cole in America, served to explain in some degree the failure of serum treatment in this disease in the past. They have shown that there are at least four types of pneumococcus, each with different serum reactions, called respectively types I., II., III. and IV. Attempts have naturally been made to prepare specific anti-sera for each of these, but so far only that for type I. has proved to be of real value in treatment, though a serum has been used in type II. Unfortunately, no effective antiserum has been obtained for type III., which is responsible for the most serious and fatal form of pneumonia. Pneumococcal vaccines have been used in the treatment of acute pneumonia, but though sometimes successful they have not achieved any widespread recognition. If they are to be of real value they must be employed early in the course of the disease. It has been recommended to use a stock vaccine as soon as the disease is recognised, and then if possible to prepare and use an autogenous one. Vaccines seem to be more helpful in cases of delayed resolution.

*Abscess and Gangrene of the Lung.*—Although some cases are successfully treated by medical measures, notably in the case of gangrene by injections of arsphenamine, the greatest success has been achieved from improved surgical methods.

*Tumours of the Lung, Mediastinum and Pleura.*—The application of artificial pneumothorax promises to render some of these more easy to recognise and to deal with surgically.

*Pulmonary Mycoses and Spirochaetosis.*—Improved laboratory methods have enlarged our knowledge of conditions due to some organisms such as moulds and spirochaetes, which occasionally cause pulmonary infections.

*Pulmonary tuberculosis.*—(*see* TUBERCULOSIS).

# DISEASES OF THE PLEURA

**Pleurisy with Effusion.**—New methods of tapping the pleura have been introduced, including the replacement of the fluid by sterile air or oxygen by means of an apparatus like that for inducing pneumothorax. This may be particularly helpful in regard to chronic or recurrent effusions, more especially such as occur in association with malignant disease.

**Empyema.**—The treatment of collections of pus in the pleura has changed considerably. The method employed varies with the cause of the empyema. In cases due to the pneumococcus, early drainage by means of removal of a small piece of rib is now the rule. In those due to streptococcal invasion repeated aspiration is adopted, until the process is localised, or until the fluid withdrawn is actually pus instead of thin turbid fluid, after which drainage by removal of a piece of rib is employed. In both cases many surgeons now employ special appliances for drainage, whereby a negative pressure is maintained in the pleural space to promote re-expansion of the lung. In empyema associated with tuberculosis, aspiration with gas replacement is the rule.

**Surgery of the Pleura and Lungs.**—War experience gave a valuable impetus to the surgical treatment of respiratory conditions. The treatment of empyema has already been referred to. Haemothorax or blood effused into the pleural space is now treated like any other effusion, and aspirated or gas-replaced if necessary. If infected it is treated like empyema (*q.v.*). Artificial pneumothorax is proving of great value as a preliminary to other operative procedures, apart from its uses as a means of treatment of pulmonary tuberculosis. The operation of exairesis or avulsion of the distal part of the phrenic nerve as a means of treatment of chronic basic lung conditions, including pulmonary tuberculosis, is on its trial and bids fair to be useful. More extensive operative procedures are ligature of branches of the pulmonary artery, and lobectomy or removal of diseased portions of the lung.

Operations designed to promote collapse of the lung when this is impracticable by artificial pneumothorax are pneumolysis and thoracoplasty. In pneumolysis attempts are made to collapse the lung, by the insertion outside the pleura of fat tissue or some extraneous substance such as paraffin. In thoracoplasty, sufficient portions of as many ribs as may be necessary are removed to allow the chest wall to fall in and thereby collapse the lung. The outlook in regard to the surgery of the lung and pleura is distinctly encouraging.

See Sir R. D. Powell and Sir P. H. S. Hartley, *Diseases of the Lungs and Pleura* (1921); F. W. Price (ed.), *Textbook of the Practice of Medicine* (1922). (R. A. Y.)

**RESTAURANT:** see FOOD SERVICE.

**RESZKE, JEAN DE** (1850-1925), operatic singer (see 23.201), died at Nice April 3 1925.

**REUNION, CHURCH.**—The movements for the Reunion of the Churches, especially among English-speaking Christians, are due mainly to two causes. In the first place, the reasons for division, which seemed once to be based on spiritual principles about which no compromise was possible, have grown fainter than they were. Few men cling to them so tenaciously as they did, *e.g.*, in the 17th century. Secondly, there is a widespread feeling of the ineffectiveness of the churches in face of the tasks and problems of civilisation since the outbreak of the World War in 1914. To a large extent this is attributed to the divisions and consequent lack of unity of witness and aim among the churches themselves. This dissatisfaction has given new emphasis to the conviction that it is the purpose of Christ that there should be only one visible body, and consequently our "unhappy divisions" are entirely contrary to His will.

These movements for reunion are concerned with the divisions outside the Roman Catholic Church, which takes no part in them. On principle it cannot do so, as it has its own terms, surrender and not adjustment, from which there can be no departure. The one possible exception to this statement is to be found in what are known as the Conversations at Malines. At the invitation of Cardinal Mercier a small body of English theologians

has met a similar body of Roman Catholic scholars for the purpose of exploring their grounds of difference. Begun quite unofficially, at a later stage these conversations have been held with the cognisance of the Archbishop of Canterbury; but at present, beyond an atmosphere of friendship and respect, very different from the controversial temper of the past, there are no positive results to report.

## I. THE CHURCH OF ENGLAND

Movements for reunion may be dealt with conveniently under three heads:—

1. The conferences and discussions based either upon the Lambeth Appeal or the proposed World Conference on Faith and Order. These are concerned with such questions as (a) the relations between the Church of England or the American Episcopal Church and the Oriental Churches, (b) the relations between the Church of England and non-Episcopal churches and possible terms of corporate union.

2. Within these larger groupings there have been movements for union owing to the urgency of practical needs or a growing sense of real identity of spiritual aim and purpose, *e.g.*, among the various sections of the Methodist Church, between the Church of Scotland and the United Free Church, among the Congregationalists, Methodists and Presbyterians of Canada, and between the Church of England and the South India United Church.

3. Some reference must be made to religious movements which, though not directly concerned with the problem of reunion, cut across ordinary ecclesiastical divisions and create an experience of unity in faith and action in groups of men who formerly were not accustomed to act together. They are important factors on the practical side, for they illustrate the wide area of agreement which exists already and by the spirit which they create make it natural to discuss even acute points of difference as friends and not as partisans.

**The Church of England and the Orthodox Eastern Church.**—Negotiations between the Church of England and the Eastern Orthodox Church for mutual recognition and fellowship have a fairly long history, but the pace has been quickened largely owing to events which have followed the World War. In Jan. 1920, an Encyclical Letter was issued from the Patriarchate of Constantinople "unto all the Churches of Christ wheresoever they be." It is an earnest plea for closer contact and better mutual understanding:—

We consider it as most important that love between the Churches should be revived and strengthened, so that they may no longer look upon each other as strangers and enemies, but as relatives and friends in Christ.

As a means to this end it is suggested that there should be a uniform calendar for Christian feasts, intercourse between theological schools, exchange of students, impartial and more historical examination of doctrinal differences, etc. Following this, a "proposed concordat" was drawn up by the American Episcopal Church. After setting forth points of agreement in faith and order, it concludes:—

In accordance with the preceding agreements, we do solemnly declare our acceptance of the sacramental acts each of the other, and that they are true and valid. And, holding fast the truth once delivered to the Saints, we pronounce that intercommunion is desirable and authorised for all our members wherever and whenever it is deemed convenient and practicable by the proper local and ecclesiastical authorities.

To this the locum tenens of the Oecumenical Patriarchate sent a sympathetic reply. The next step was the presence of a delegation of the Patriarchate at the Lambeth Conference in July 1920. Their subsequent report to the Holy Synod is marked by a good deal of reserve. The latitude of the Church of England is a source of difficulty.

While with us the true member of the Church, who continues in organic union with the whole, must accept the whole of our teaching, share economically in the Holy Sacraments and believe in lawfully settled ecclesiastical principles, in the English Church men differing from each other in faith, not in things indifferent and non-essential, constitute one undivided whole.

They also point out that the Lambeth Appeal puts forward "measures in relation to the non-episcopal Churches which also, in spite of goodwill, manifestly conflict with venerated principles and systems." Subsequently the Eastern Churches committee appointed by the Archbishop of Canterbury issued a statement

of terms of intercommunion. In Feb. 1923, the Archbishop announced that the Holy Synod at Constantinople, after careful consideration, had decided in favour of the validity of Anglican ordinations. He pointed out, however, that this decision must be endorsed by all Patriarchates or by a General Council before it could become an oecumenical act.

*The Church of England and the Free Churches.*—The movement for closer relations between the Church of England and the Free Churches has been roused into activity by the Lambeth Appeal to all Christian people in 1920. This brought to a focus various efforts for a better understanding which have been going on behind the scenes, notably in the conferences held at Mansfield College, Oxford, in 1919 and 1920. The American proposal for a world conference on Faith and Order was made at the general convention of the American Episcopal Church in 1910, prior to the Lambeth Appeal. Various commissions have been appointed, the adhesion of numerous churches in Europe and America has been secured, and a great deal of preliminary work has been done. In 1920, a meeting of a widely representative character was held in Geneva and it is hoped that the world conference itself will meet in 1927; but no forecast can be given of the probable result in view of the conflicting claims and traditions which have to be harmonised. The Lambeth Appeal, though addressed to all Christian people, has had its most important effect in the field of English ecclesiastical life. It has forced the great nonconformist bodies to reconsider their relations to the Church of England and the grounds of their separation, and to do so in an atmosphere of friendliness and goodwill. The terms on which the appeal believes that union is possible are as follows:—

We believe that the visible unity of the church will be found to involve the whole-hearted acceptance of—

The Holy Scriptures, as the record of God's revelation of Himself to man, and as being the rule and ultimate standard of faith; and the Creed, commonly called Nicene, as the sufficient statement of the Christian faith, and either it or the Apostle's Creed as the baptismal confession of belief;

The divinely instituted sacraments of Baptism and the Holy Communion, as expressing for all the corporate life of the whole fellowship in and with Christ;

A ministry acknowledged by every part of the Church as possessing not only the inward call of the Spirit, but also the commission of Christ and the authority of the whole body.

It is claimed that the Episcopate is the one means of providing such a ministry. "But we greatly desire," it is added, "that the office of a Bishop should be everywhere exercised in a representative and constitutional manner, and more truly express all that ought to be involved for the life of the Christian family in the title of Father-in-God." These proposals have been the subject of prolonged discussion between representatives of the Church of England on the one hand and a joint committee of the Federal Council of the Evangelical Free Churches and the National Free Church Council on the other, but so far no agreement has been found possible on two matters of essential importance, viz., the use of the Creed and the necessity of episcopal ordination.

On the first point, the Free Church position is expressed in the resolutions adopted by the annual assembly of the Federal Council in Sept. 1922:—

We regard the place given to the two ancient Catholic creeds as . . . subordinate to the inspired Word and living Spirit; and these creeds are received not as a complete expression of the faith, but as preserving "essential elements" in it "in the form handed down through many centuries," and with reasonable liberty as to their interpretation and their use. We hold as not only consistent with this, but as implied in it, alike the fullest freedom in the intellectual investigation of Truth and the most single-hearted discipleship to the Mind of Christ.

In regard to episcopal ordination the difficulty turns upon the question of the validity of the Free Church ministry. There is on the one hand a natural refusal to accept anything which implies that the Free Church minister must be re-ordained before he can administer valid sacraments in a united Church, and on the other there is disinclination on the part of the Church of England to advance beyond the admission that many Free Church ministries have been "manifestly blessed and owned by

the Holy Spirit as effective means of grace," and consequently must be regarded as "real ministries of Christ's Word and Sacraments in the Universal Church," though they may be in varying degrees "irregular or defective."

*General Results.*—The difficulties indicated above are still unsolved, in spite of many discussions and explanatory statements marked by a very conciliatory spirit. In a memorandum signed by the Archbishops of Canterbury and York and the Moderator of the Federal Council in June 1925, it is stated that the joint conference believes that there should be a suspension of its activities in order that the documents already submitted may be studied with care. At its annual meeting in Sept. the Federal Council concurred, and at the same time recorded its conviction that the conferences which have taken place "have done much to bring representative members of the Churches concerned into closer fellowship and to a better understanding of each other's position; and, further, that they have prepared the way to further progress towards unity in the future."

## II. METHODIST AND PRESBYTERIAN REUNION

*Methodist Reunion.*—The movement for reunion among the three branches of the Methodist Churches in England has reached a stage when it seems likely that it will soon be an accomplished fact. A scheme has been drawn up, and in 1924 the Wesleyan Conference, the Primitive Methodist Conference and the United Methodist Conference passed a practically identical resolution in the following terms:—

The conference is of opinion that, provided the Methodist people desire the organic union of the three Methodist Churches concerned, the scheme now submitted (which is the result of prolonged deliberation and exhaustive inquiry) affords a basis of union which would ensure harmonious working without the sacrifice of any principle vital to Methodism. The conference therefore commends the scheme to the prayerful consideration of the Methodist people

In 1925 the Wesleyan conference took the further necessary step of declaring in favour of the union of the three Methodist Churches, provided that substantial agreement can be secured as to the measures to be adopted for effecting union. If this agreement is secured, application for an Enabling Act must be made to Parliament.

*The Churches of Scotland.*—The first step towards union between the Church of Scotland and the United Free Church of Scotland was taken in 1908, when the General Assembly of the Church of Scotland resolved "to request the other Presbyterian Churches to confer with them on the present ecclesiastical situation." Conferences followed, and in 1914 a constitution was drafted under which the Church would be both national and free. No further progress was possible till 1919, owing to the War. In 1920, the articles of the constitution were approved and in July 1921, an Enabling Bill was passed by Parliament. Certain questions connected with the property and endowments of the Church of Scotland remained to be dealt with by a departmental committee appointed in 1922 and presided over by Lord Haldane. It reported in 1923, and its recommendations are embodied in The Church of Scotland (Property and Endowments) Bill of 1924.

*Reunion in Canada and Australia.* In Jan. 1924, the Presbyterian, Methodist and Congregational Churches in Canada accepted a scheme of union under the name "The United Church of Canada." In spite of an elaborate statement of doctrine, which has evidently been drawn up so as to exclude any possibility of modernist heresy, the dissentient churches have been few in number. There is a movement among the same bodies in Australia for union on very similar lines with the title "The United Church of Australia."

## III. REUNION IN THE MISSION FIELD AND ELSEWHERE

The need for union on the mission field is illustrated by the negotiations between the Episcopal Synod of India and Ceylon and the South India United Church. The latter is a union of Christian congregations connected with the London Missionary Society and the American Board of Commissioners for Foreign Missions (both Congregational), the Church of Scotland, the United Free Church of Scotland, the Dutch Reformed Church in America and the Basel Mission. A joint com-

mittee was constituted in 1920 and several reports have been issued. As in England, the difficulty of agreement turned chiefly on the insistence upon episcopal ordination for all ministers of the United Church. It is suggested that the fact of episcopacy should be recognised without insistence upon any doctrine of its meaning, and that a joint service should be held to commission all ministers who desired full status in the United Church on reciprocally equal terms. The South India United Church also insists that it cannot allow itself to be cut off from these non-episcopal churches with which it is now in full communion.

It treasures its present catholicity too highly to take any step that would diminish or destroy the fellowship which it now enjoys with Evangelical Christendom.—(Resolution, Aug. 1923.)

A brief reference must be made to some of the movements of co-operation among different bodies of Christians, which have grown in strength and number since the end of the World War. Though these movements do not deal directly with the problem of reunion, the same motives lie behind them, viz.: a sense of the weakness of the Christian witness in the world due to division and a desire to co-operate in large fields of Christian enterprise which are recognised as common ground. (a) The World Alliance for promoting International Friendship through the Churches, founded at Constance on Aug. 2 1914.

Its object is set forth in the following resolutions:—

1. That, inasmuch as the work of conciliation and the promotion of amity is essentially a Christian task, it is expedient that the Churches in all lands should use their influence with the peoples, parliaments and governments of the world to bring about good and friendly relations between the nations, so that, along the path of peaceful civilisation, they may reach that universal goodwill which Christianity has taught mankind to aspire after. 2. That inasmuch as all sections of the Church of Christ are equally concerned in the maintenance of peace and the promotion of good feeling among all the races of the world, it is advisable for them to act in concert in their efforts to carry the foregoing resolution into effect.

The Alliance consists of 28 national councils and is representative of the organised Christianity of the world with the exception of the Roman Catholic Church. The international committee meets once every three years. Its meetings in Copenhagen (1922) and Stockholm (1925) did much to focus Christian thought upon the question of peace. The expense of the international work of the Alliance is borne by the American Peace Union.

*International Missionary Council.*—The functions of this body are defined in the following resolutions adopted in 1921:—

1. To stimulate thinking and investigation on missionary questions, to enlist in the solution of these questions the best knowledge and experience to be found in all countries and to make the results available for all missionary societies and missions.
2. To help to co-ordinate the activities of the national missionary organisations of the different countries and of the societies they represent, and to bring about united action where necessary in missionary matters.
3. Through common consultation to help to unite Christian public opinion in support of freedom of conscience and religion and of missionary liberty.
4. To help to unite the Christian forces of the world in seeking justice in international and inter-racial relations.

The Council is responsible for the publication of the *International Review of Missions*.

*Universal Christian Conference.*—The universal Christian conference on Life and Work held its first meeting at Stockholm in Aug. 1925. Six hundred and ten delegates were present, representing 31 communions and 37 nations. As a result, a message to all followers of Christ has been issued, setting forth the findings of the conference in the sphere of economics, of social morality and of international and inter-racial relationships. A continuation committee has been appointed:—

To follow up what has been begun, to consider how effect can be given to the suggestions which have been made, to examine the practicability of calling another such conference at a future date and in particular to take steps for the further study of difficult problems, and that further education of ourselves and of our Churches, on which all wise action and judgment must be based.

The conferences at Mürren, under the leadership of Sir Henry Lunn, must also be mentioned in this connection. Though not representative in any official way yet, by bringing together leading members of English denominations in an atmosphere of friendship and sympathy, they have been a factor of some importance in preparing the way for some form of corporate reunion.

#### IV. REUNION IN THE UNITED STATES

The first pronounced voices for reunion in the United States were those of Thomas Campbell and his son Alexander of the Seceder Presbyterian Church, whose labours at the beginning of the 19th century, gave formation to the communion known as Disciples of Christ. The irenic attitude of the father was overshadowed by the aggressive attitude of the son, who became the leader of the movement; but the constant controversies and acrimonious debates of the Disciples, along with their rapid growth, especially in the Middle West, drove them somewhat into isolation and, therefore, into a denominational attitude which, in the midst of other interests, quite obscured their message for reunion. From the middle of the 19th century to nearly its close Philip Schaff, of the Reformed Church, was, perhaps, the foremost voice for reunion in the United States. He was one of the founders of the American branch of the Evangelical Alliance.

Recent interests in reunion in the United States centre around the year 1910. In the summer of that year several Protestant Episcopalians organised the Christian Unity Foundation of New York for the promotion of Christian unity throughout the world by research and conference. They invited representatives of several communions to be their guests for conference and published pamphlets announcing the results of these conferences. It was the first attempt on the part of one communion to set forth under their own authorship and at their own expense a friendly interpretation of another communion without some adverse criticism.

On Oct. 19 of that same year at the General Convention of the Protestant Episcopal Church, meeting in Cincinnati, a commission, consisting of seven bishops, seven presbyters and seven laymen, was appointed to take under advisement the promotion of a world conference on the Faith and Order of the Church to be participated in by representatives of all Christian bodies throughout the world. On the same day the Disciples of Christ, meeting in their General convention in Topeka, organised the Association for the Promotion of Christian Unity, emphasising intercessory, prayer, friendly conferences and the distribution of Christian unity literature by writers from all communions. At the same time the Congregationalists, meeting in their National Council in Boston, appointed a commission on Christian unity, dealing with all churches, but especially with the Protestant Episcopal Church.

The Episcopal movement, under the leadership of Robert H. Gardiner, soon brought into co-operation representatives from most of the Christian communions; and their first preliminary conference, held at Geneva, Switzerland, in 1920, marked the opening of a new chapter in theological reconciliation. Of the larger churches only the Roman Catholic Church declined the invitation, but the Pope expressed sympathetic interest. For ten days representatives from Eastern Orthodox, Anglican and Protestant churches sat together in friendly conferences over theological questions that have divided Christendom for centuries. The next conference is to be held in 1927 at Lausanne. Many smaller conferences in this cause have been held in the United States and other countries.

The Disciple movement continued its policy as announced by its Association for the Promotion of Christian Unity. In 1925 the

secretary of that organisation became also a member of the secretariat of the World Conference on Faith and Order, and in 1926 the chief publication of the association—*The Christian Union Quarterly*—became a separate corporation, independent of any communion, having been from the start functioning interdenominationally, with an inter denominational editorial council composed of representatives from various communions in all parts of the world. The Congregational movement functioned in a general agitation for Christian reunion, particularly under the leadership of Newman Smyth, who advocated a concordat with the Protestant Episcopal Church; this, however, failed of ratification by either communion.

At the instance of the Presbyterian General Assembly in 1918 the American Council on Organic Union of the Evangelical Churches of America was organised and bore testimony to the necessity of reunion by a representative gathering in Philadelphia, in which 16 Protestant communions took part.

The Federal Council of the Churches of Christ in America was organised in 1908 in Philadelphia for the co-operation of the various Protestant communions in service rather than in an attempt to unite upon definitions of theology and polity. It has grown into large usefulness. Aside from its general service through the Protestant denominations, more than 50 municipalities and several states have formed church federations. Its headquarters are located in New York City. While Protestant federation is not reunion, the Federal Council has functioned remarkably toward a larger and better understanding among Protestants and thereby has contributed to reunion.

**REVEL** OR TALLINN (see 23.211), the capital of Estonia, had a population in 1922 of 120,179, 84.8% Estonians, 8% German and 3% Russian. All the streets have been renamed in Estonian, and the statue of Peter the Great removed from Peetri Place, but Russian is spoken everywhere. Revel is a fine old city, but is passing through difficult times; the country is surrounded by rivals, so that there is little trade. Estonia is little developed industrially, and most of the factories are in Revel. There has been considerable over-production, owing to expectations of trade with Russia, which have not been realised. An International Industrial Fair is held yearly in June. Revel is the chief port of Estonia; the harbour is closed for some weeks in the early part of the year by ice, but a channel is kept open by an ice-breaker. A polytechnic and technical school have been opened. There were raids on groups of communists in 1924, and 149 were tried and sentenced. An armed rising in Dec. led to serious street fighting, but was quickly suppressed. Soon afterwards the railway station was burnt down by communists.

**REVILLE, ALBERT** (1826–1906), French Protestant theologian (see 23.224), died in Paris Oct. 25 1906.

**REVOLVER:** see PISTOL.

**REVUE:** see VARIETY THEATRE.

**REYER, ERNEST** (1823–1909), French musical composer (see 23.225), died at Lavandou-sur-Hyères Jan. 15 1909.

**REYMONT, LADISLAS STANISLAS** (1867–1925), Polish novelist, was born at Kobiele Wielkie in the county of Piotrkow May 7 1867. He spent his youth in various transient occupations and his first novels were written when he was superintendent of a small railway sector. *The Comédienne* (1896, Eng. tr. 1921), *Ferments*, 2 vol. (1897) and *Lily* (1899) were objective novels describing the every day life of a troupe of provincial actors. In 1899 appeared *The Promised Land* (2 vol.), modelled on Zola and based on life in the Polish industrial town of Łódź. Reymont's best-known work, *The Peasants*, appeared in four

volumes 1904–9 (Eng. tr. 1925–6). In it he revealed unusual insight into the life of the Polish peasant; the construction of the novel is based on the four seasons' labours of a peasant and brings to light his primitive instincts, inward dignity and almost religious attachment to the land. The merits of Reymont's peasant epic were recognised by the award of the Nobel Prize for literature in 1924. While *The Peasants* was being prepared, a number of novels and short stories appeared, the most important of which are *Before Dawn* (1902), *Komurasaki* (1903), *From a Diary* (1903) and *The Storm* (1907). As a historical novelist, Reymont, the naturalist and observer of the direct processes of life, was not so successful: the trilogy 1794, (*The Last Diet*, 1913, *Nil Desperandum*, 1916 and *The Insurrection*, 1918), though not lacking in literary merit, revealed a lack of historical exactness. *The Revolt*, Reymont's last work, an allegorical novel describing a revolt of domestic animals against man appeared in 1924. He died Dec. 5 1925. (See POLISH LITERATURE.)

**RHINE** (see 23.240).—The Treaty of Versailles (1920), while deciding that the Act of Mannheim (see 23.241) should, under certain conditions, continue to regulate navigation on the Rhine, put the vessels of all nations on the same footing as vessels belonging to the Rhine navigation. The composition of the Central Commission was modified by the admission of Switzerland, Belgium, Great Britain and Italy. Belgium, though a non-riparian State, is in an exceptional position, since Antwerp handles a large amount of Rhine traffic. The terms of the Treaty of Versailles in respect of the Rhine were completed by a protocol of adhesion on the part of the Netherlands, dated Jan. 21 1921, accompanied by an additional protocol dated March 29 1923. The Barcelona Convention (see INLAND WATER TRANSPORT) applies to the Rhine, and its provisions take precedence over those of the Mannheim Convention, should the two texts disagree.

**Regulation Work.**—Under Articles 358 and 359 of the Treaty the Central Commission for Rhine Navigation has had to deal with works of regulation on the Rhine between Strasbourg and Basle. A scheme was laid before the Commission by the French Govt. for the creation of the Grand Canal d'Alsace between Huningue and Strasbourg, intended to be used both for navigation and for hydraulic power. Under Article 358 the Central Commission must see that the execution of this scheme does not interfere with navigability or reduce facilities for navigation. The French scheme planned the construction of a weir across the bed of the Rhine and of a canal on the left bank running more or less parallel to the Rhine, being about 114 km. long, and comprising eight locks and eight power stations. At low watermark all the water of the Rhine, with the exception of 50 cu. metres, would be taken by the canal; at the average water level the canal would take about 800 cu. metres per second. The weir was to have nine bays, the three central ones having an opening 30 metres wide, closed by movable sluice-gates; furthermore, fish ladders were to be built on both banks. The canal would have a bottom width of 86 metres and an average depth of 6.50 metres. The power available for the whole of the various stations would at average water level be equivalent to 769,000 horse-power.

The Swiss Govt. submitted a scheme for regulation works on the Basle-Strasbourg stretch. The Commission considered the two schemes simultaneously, and approved under certain conditions both schemes. The final decision was taken in April 1925. In the meantime the schemes had been modified. After the approval in May 1922, by the Commission of the digging of the first stretch, the French Govt. had submitted in 1924 a new detailed scheme for the seven other reaches. The Swiss Govt., after the Commission (also in May 1922) had approved the principle of regulation work, proceeded, with the assistance of the Baden Hydraulic Service, to investigate a scheme for works of regulation between Strasbourg and Istein.

Approval of the works of regulation was subject to an undertaking on the part of Germany and Switzerland to prevent navigation being in any way impeded (by the carrying out of the works of regulation) and to provide compensation for any damage that the part of the Rhine below Strasbourg might suffer from the carrying out of works above that town.

As far as the canal was concerned, the Commission laid down the following conditions:—Each reach must have two connected locks 25 metres wide, and at least 185 and 100 metres long, respectively. Furthermore, a place where boats can lie while waiting to enter the lock (garage) 1,000 metres long and 75 metres wide upstream, and

another similar mooring place of the same width and at least 500 metres long downstream from the locks must be provided. Provision must be made for the working of the locks by day and night even on Sundays and holidays. Each reach must also have two places at which craft can turn about. So far as the working of the power stations and locks is concerned, they must not interfere with the regular flow of the Rhine. The Central Commission further took note of an undertaking given by France similar to that demanded from Germany and Switzerland in respect of works of regulation. Lastly, it is laid down that navigation on the canal should be subject to the same international régime as navigation on the Rhine, in particular no toll or tax can be levied for the use of the waterway and the locks.

The question of the customs régime on the canal was left open. It was maintained from certain quarters that since the canal was not to involve any reduction of facilities for navigation, no customs formalities could be imposed during the journey on craft plying along the canal, since at the present time no such formalities existed on the Rhine where it formed the frontier between France and Germany.

**Traffic Tariffs.**—In virtue of Article 354 of the Treaty of Versailles the Central Commission for Rhine Navigation was in 1926 still engaged in revising the Convention of Mannheim of 1868. Among the questions which the Commission had still to discuss the following may be quoted: In several countries the railways introduced a tariff system which is seriously injuring shipping on the Rhine. The German railways reintroduced preferential tariffs for traffic to their seaports. This measure resulted in diverting traffic from its natural course to the ports of Hamburg and Bremen. On the other hand, the preferential tariffs, which existed before the World War for the Rhine ports, but which were abolished after the War at the same time as the tariffs for seaports, were not reintroduced; principally because since the transfer of the railways of the federated States to the Reich, the Baden and Palatinate railways have lost their direct interest in developing traffic involving transhipment at a Rhine port. Moreover, as long ago as 1920 Germany introduced a new graduated tariff with reduced rates for long distances and relatively high rates for short distances. These two measures in conjunction considerably diminished the hinterland for Rhine navigation, both as regards inward and outward traffic. The French and Belgian railways also introduced very low rates for traffic in certain directions and over certain lines; much of the traffic to and from the Saar Territory and Alsace-Lorraine was thus diverted.

Mr. Hines, in his report on Rhine navigation, expressed the opinion that both from the national and from the international point of view it is in the general interest that all traffic which can normally be carried on the Rhine with economic advantage should follow that route, and that the destruction of this river traffic by purely artificial reductions in railway rates would conflict with the fundamental interests of all the riparian States.

**The Policy of France.**—Another important question is that of the special supertax (*surtaxe d'entrepôt*) imposed by France on goods imported from overseas by any route other than a French seaport. The general policy of additional taxes adopted by the French Govt., and which now also applies to Alsace-Lorraine had the effect of diverting traffic from the Rhine: A single exception was made for the port of Antwerp as regards imports to Alsace-Lorraine. Consequently much of the traffic which formerly passed through Rotterdam now goes through Antwerp. It has been argued on the Dutch side that the fact that goods imported into Alsace through Havre, for example, pay reduced customs duties while the same privileges are not granted to goods imported by the Rhine through Rotterdam, is not in accordance with the provisions of Article 14 of the Convention of Mannheim, which lays down that any facilities which may be granted by the High Contracting Parties in respect of the import, export and transit of goods by other land routes or waterways shall also be granted in respect of their import, export and transit on the Rhine.

A careful examination of this problem gives rise to the question whether the establishment of a discrimination between certain Rhine ports, and between the Rhine and other traffic routes to the advantage of the latter, is in accordance with the principle

that an international river such as the Rhine should be considered as the common property of all the riparian States; and whether such a discrimination does not show a lack of appreciation of the economic interdependence of all the countries interested in international navigation on the Rhine—a factor which places them under an obligation to co-operate loyally and effectively in order to maintain that navigation in a prosperous condition.

**RHINELAND** (see 23.242.)—France's "historic Rhine policy," inspired by memories of Napoleonic times, had already taken definite form by the end of 1916. At this time it was not officially made known to Great Britain, but private negotiations with Russia led to that Power's pledging herself on Feb. 12 1917 to support France's plan of erecting a buffer state on the left bank of the Rhine.

**The French Plan and the Treaty Settlement.**—Russia was no longer an ally when Clemenceau laid his definite plan before Lloyd George and Wilson on Mar. 14 1919. It proposed that "the line of the Rhine be occupied, in virtue of a mandate from the League of Nations, by an inter-Allied military force," together with the bridgeheads. The territories on the left bank of the Rhine, (except Alsace-Lorraine) should be formed into "one or more independent states under the protection of the League of Nations." Even this suggestion was a concession, since Marshal Foch had pleaded, not only a Rhine frontier for Germany, but that the Rhineland countries be grouped with France, Belgium, Luxembourg and Alsace-Lorraine in "one single military organisation;" i.e., the Rhine provinces were to be the French military outposts against Germany, although they were to enjoy autonomy and self-administration. The bridgeheads were to be permanently occupied, and a zone on the right bank of the Rhine neutralised. (*Mémoire* by Marshal Foch of Nov. 27 1918.)

Great Britain and the United States resisted this proposal, and as a compromise, it was ordained (Treaty of Versailles, Art. 428–432) that the left bank of the Rhine, with the bridgeheads, should be occupied by Inter-Allied troops for 15 years; but if Germany fulfilled her obligations faithfully, two zones were to be evacuated earlier: the Cologne zone after five years, that of Coblenz after ten. The left bank, and a 50 km. wide zone on the right bank, were to be permanently demilitarised (Art. 42–44).

The Inter-Allied High Commission was set up by a separate agreement (the Rhineland Agreement) signed on the same day as the Treaty of Versailles, June 28 1919 (British Treaty series No. 7). Belgium, France, Great Britain and the United States were to be represented. The High Commission had authority to issue all ordinances so far as might be necessary for securing the maintenance, safety and requirement of the Allied and Associated forces; but all civil administration unaffected by these powers remained in the control of the German authorities. As, however, the United States did not ratify the Treaty of Versailles, their member had no official voice on the commission. France, since Belgium followed her lead, was in a predominant position. M. Tirard was the first chairman. British troops occupied an area of which the centre was the bridgehead of Cologne; Belgian, the territory to the north of this; French, the whole district to its south, except that American troops occupied Coblenz until Jan. 10 1923.

**The Separatist Movement.**—A certain mistrust of Protestant Prussia, a relic of past religious quarrels, still lingered amongst the Catholic Rhinelanders. When the revolutionary disturbances of 1919 in Berlin made it seem possible that the capital might become the centre of a Communist Prussia, many prominent personages in the Centre party in Rhineland considered for a brief period the formation of an autonomous Rhineland territory within the Reich.

The French authorities overestimated this movement, which was abandoned within a few weeks of its inception. They set to

work to de-Germanise the Rhine, cautiously utilising the ordinances of the High Commission for this purpose and discreetly supporting certain German malcontents. Considerable efforts were made by propaganda and other means to foster a local movement in favour of an independent buffer state under French influences. The result of this policy was that all responsible German leaders dissociated themselves from these proposals and on July 24 1920, Dr. Dorten, the head of the separatist movement, was arrested by German police in the occupied territory but released under French pressure. French action in the Rhineland was closely, if obscurely, connected with their support of separatist activities in Bavaria. The French policy was not able to make much progress until an opportunity was offered it by the occupation of the Ruhr, Jan. 1923.

The measures applied in the Ruhr (*q.v.*) by military proclamation were enforced in Rhineland by special ordinances of the High Commission passed by the French and Belgians alone, the British abstaining. The local political and other leaders were promptly deported; in many areas every higher official was sent away. Most newspapers were suppressed and the people intimidated by the threat of summary expulsion. The Germans resisted by secret organisations, which on one occasion at least resorted to violence against Separatist "traitors." In the British area the ordinances of the French were not applied, and peace was preserved with French and Germans alike, although the cutting off of the British zone from the rest of Germany by French posts (a species of blockade) and a dispute over the Cologne railways, which the French sought to include in their Régie, made it doubtful at times whether Great Britain could remain on the Rhine.

*The Rhineland "Republics."*—By Aug. 1923 preparations for a coup d'état were so near completion that secrecy was largely abandoned and in defiance of the Allied ordinances, a "Separatist Army" numbering some thousands was armed and drilled in the French and Belgian zone. When German resistance in the Ruhr began to weaken, a large Separatist demonstration was held in Düsseldorf, culminating in a premeditated attack on the German police in which both sides used firearms and there were many casualties. The French arrested and disarmed the police the same day, and later sentenced some of them to long terms of imprisonment, deporting the remainder. The fear of seeing a French-controlled Rhenish Republic enveloping Belgium led a section of the Belgian military to anticipate the French by organising the proclamation of a Rhineland Republic under puppet leaders in Aix-la-Chapelle on Oct. 21 1923. Though the preparations in the French zone were not yet complete, the Separatists there also now proclaimed a "Republic." The police were regularly disarmed by the French authorities and citizens prevented from forming protective associations; French Régie trains then brought in armed roughs after curfew, who forced an entrance into the public buildings, proclaimed a "Republic," and installed some man, not always of irreproachable antecedents—as local commissar. The population took no part in all this, yet the reign of terror at last brought even the reputable citizens to think seriously of buying peace at the price of some sort of temporary separation. The French indicated that support of the hired Separatists would be abandoned, but only on terms involving such complete separation from Germany that the Rhinelanders recoiled.

Through British influence in Brussels the Belgian Cabinet, which had all along distrusted the adventure, finally ordered the disarming of the Separatists in accordance with Allied ordinances on Nov. 2 1923. The French maintained the "Republic" for several months longer. A special effort was made to separate at least the Bavarian Palatinate. The population was completely terrorised after several months of Separatist rule, but within two days of the French attempt to secure official recognition of the "autonomous palatinate" by the high commission, the "president" and three of his associates were assassinated in a Speyer restaurant on Jan. 9 1924 under the eyes of French officers by a party of German youths who escaped across the Rhine. There was another terrible incident when the population of

Pirmasens set fire to the Separatist headquarters; over a dozen Separatists perished in the fighting or in the flames.

*Change in French Policy.*—With the advent to power of M. Herriot in May 1924 French policy finally changed. The British evacuation of Cologne and the Cologne district, originally fixed for Jan. 10 1925, was postponed by the report of the Control Commission that Germany had not fulfilled the disarmament clauses of the Peace Treaty. It was only effected after long negotiations in Dec. 1925, when the British Army on the Rhine removed its headquarters to Wiesbaden.

**RHODE ISLAND** (*see* 23.248), a state of the United States of America. The population of the State in 1925 (state enumeration) was 679,260; in 1920, 604,397; in 1910, 542,610. The increase from 1910 to 1920 was 61,787, or 11.4%; and that from 1920 to 1925, 74,863, or 12.4 per cent. Rhode Island was still in 1920 the most densely populated State, having 566.4 inhabitants to the square mile. The percentages of urban and rural populations in 1925 were urban, 97.8%, and rural, 2.2%; as compared with urban, 97.5%, and rural, 2.5% in 1920; and urban, 96.7%, and rural, 3.3% in 1910. The following are the cities of Rhode Island having a population of over 20,000 in 1925 and their percentages of increase in the 1910–20 and the 1920–5 periods:—

|                     | 1925    | 1920    | 1910    | % Increase<br>1920–5 | % Increase<br>1910–20 |
|---------------------|---------|---------|---------|----------------------|-----------------------|
| Providence . . .    | 267,918 | 237,595 | 224,326 | 12.8                 | 5.9                   |
| Pawtucket . . .     | 69,760  | 64,248  | 51,622  | 8.6                  | 24.5                  |
| Woonsocket . . .    | 49,681  | 43,496  | 38,125  | 14.2                 | 14.1                  |
| Cranston . . .      | 34,471  | 29,407  | 21,107  | 17.2                 | 39.3                  |
| Newport . . .       | 27,757  | 30,255  | 27,149  | –8.3                 | 11.4                  |
| East Providence . . | 26,088  | 21,793  | 15,808  | 19.7                 | 37.9                  |
| Central Falls . . . | 25,403  | 24,174  | 22,754  | 5.1                  | 6.2                   |

The proportion of native whites in 1925 was 71.7%, as compared with 69.6% in 1920, and 65.3% in 1910; of foreign-born whites in 1925, 26.7%, as compared with 28.7% in 1920, and 32.8% in 1910. Up to 1910 the largest foreign-born element was the Irish. In both 1920 and 1925 the Irish were numerically inferior to the English and English-Canadian, the Italian and the French-Canadian. In 1925 the French-Canadian numbered 35,548; the Italian, 34,671; the English, 26,885; the English-Canadian, 5,303; and the Irish, 19,800. Since 1910 there has been a remarkable increase in the number of Italian, Portuguese and Polish immigrants and a noticeable influx of Armenians and Syrians.

*Agriculture.*—There was a decline in farm acreage of 29.3% between 1890 and 1920 when it totalled 331,600 ac., and an even greater decline of 51.2% in improved acreage, which was 132,855 ac. in 1920. The number of farms fell from 5,292 in 1910 to 3,911 in 1925. On the other hand there has been a rise in the value of farms. The value of all farm property in 1910 was \$32,990,739, and in 1925, \$33,446,425.

*Manufactures.*—Rhode Island is pre-eminently a manufacturing State. The number of persons engaged in manufacturing industries increased 9.8% from 1909 to 1923 (1909, 122,641; 1923, 134,667); the wages paid 172.4% (1909, \$55,234,068; 1923, \$150,449,859). The number of establishments increased from 1,951 in 1909 to 2,190 in 1914 and to 2,466 in 1919, but decreased to 1,692 in 1923. The value of products increased 141% from 1909 to 1923 (1909, \$280,343,797; 1923, \$675,425,020). Textiles still held in 1923 the first place among the manufactures of the State, employing 81,922 persons. From 1909 to 1923, cotton-goods mills (including cotton small wares) increased in number from 106 to 145; in employees from 28,786 to 38,678; in wages from \$11,797,000 to \$41,411,359; and in value of products from \$50,313,000 to \$146,702,582. From 1909 to 1923 woollen and worsted-goods mills increased in number from 88 to 91; in em-

ployees from 24,924 to 26,840; in wages from \$11,538,000 to \$30,293,439; and in value of products from \$74,600,000 to \$167,772,827.

Hosiery, knit goods, webbing, braid and tire fabrics were also produced in large quantities. In 1923 the machine tools and machine products manufactories and foundries numbered 116 (of these, 51 produced textile machinery and parts), with 11,456 employees, wages \$14,267,762, and value of products \$41,447,937. In 1923 the number of jewellery and silverware manufactories was 237, with 9,147 employees, wages \$10,125,761, and value of products \$42,846,043. The percentages of all factory employees who were children under 16 years of age were: in 1910, 3.6%; 1915, 3.16%; 1918, 4.44%; 1920, 3.69%; 1921, 2.72%; 1923, 2.62%; 1924, 2.2%. The State law raising the minimum working age to 15 years (with certain exceptions) went into effect Sept. 1 1924.

**Commerce.**—The city of Providence owns at Fields Point nearly 300 ac. of land, and is developing a municipal wharf, which was 3,000 ft. long in 1925, with 35 ft. water depth. In 1924, foreign and domestic commerce passing through Narragansett Bay totalled 3,579,191 tons, of which 1,065,048 was brought into Providence. The foreign imports of the customs district of Rhode Island amounted in 1924 to \$7,654,115. Providence has since 1910 become the oil distributing centre for New England (1910, 106,216 tons brought in by water; 1924, 1,065,148 tons), and is becoming one of the largest lumber distributing ports in New England (99,542 tons in 1924).

**Finance.**—The financial position of the State on Dec. 31 1925, was: assessed valuation \$1,185,162,654; ratable wealth \$2,062,542,549 (about \$3,036 *per capita*). For the year ending Nov. 30 1924, receipts were \$7,974,306; expenditures \$5,588,841; funded debt \$12,691,000; and sinking fund \$2,399,487. The banking establishments had total resources of \$508,325,241. From June 30 1910 to June 30 1925, the number of savings depositors increased from 195,977 to 344,956, the amounts of deposits from \$116,913,590 to \$267,154,595, and the average for each depositor from \$596 to \$774.

**Social Work.**—In 1912 the General Assembly created a Board of Control and Supply to have joint control with the Board of State Charities and Corrections over all State institutions except the State Sanatorium and the Institute for the Deaf. In 1917, both of these boards were abolished and their places taken by the Penal and Charitable Commission, the name of which was changed in 1923 to the State Public Welfare Commission. Beginning in 1915 a placing-out policy has been developed by the State Home and School, until in 1924, of 850 children under its care, nearly 700 were placed out. In 1923, a Mothers' Aid law was passed, and a law providing for a Director of State Institutions.

**Education.**—The total population between four and 20 years of age as shown by the Jan. 1925 school census was 197,503. Of these 109,382 were of compulsory school age (7-15 years inclusive). During the school year 1924-5 there were in public schools 104,142 pupils; in parochial schools 24,251; and in private schools 3,501. In 1924, 17 towns and cities reported classes totalling 100 conducted for teaching English in compliance with the State compulsory Americanisation law, with 1,226 pupils within the ages covered by the law (16-21), and 117 teachers, of whom 87 were certified as trained specifically for Americanisation work. The total expenditure for education in 1924-25 was \$9,178,575, of which the State contributed \$1,411,958. In April 1920 the name of the State Normal School was changed to the Rhode Island College of Education. The enrolment of the institution in 1924-5 was 561 students and 34 instructors, with 1,464 in the extension department and 367 in the summer school.

**History.**—In 1922 the Democratic candidates for governor, lieutenant-governor, attorney-general and general treasurer were elected, although the Republicans retained control of both branches of the General Assembly. A long struggle in the Senate culminated in the Republican members leaving for Rutland, Mass., on June 19 1924, where they stayed until Jan. 5 1925. The Democratic minority continued to meet daily, however,

until the newly elected Senate took office. The legislative business of the State was practically at a standstill for a year, and the failure of passage of the annual appropriation bill in 1924 led to the advancing of money to the State by private individuals and by 23 Rhode Island banks.

In 1909 the number of representatives in the Lower House was fixed at 100. The city of Providence, with 40% of the population of the State, has but one member in a Senate of 39. In 1912 the number of congressional districts was increased from two to three. The presidential vote of the State was cast in 1912 for Wilson (Dem.); in 1916 for Hughes (Rep.) (though at the same time a Democratic U. S. Senator was elected); in 1920 for Harding (Rep.); and in 1924 for Coolidge (Rep.). Rhode Island ratified the Nineteenth (Woman Suffrage) Amendment to the Federal Constitution; but failed to ratify the Eighteenth (Prohibition) Amendment. The governors since 1910 were: Aram J. Pothier (Rep.), 1909-15; R. Livingston Beeckman (Rep.), 1915-21; Emery J. San Souci (Rep.), 1921-23; William S. Flynn (Dem.), 1923-5; Aram J. Pothier (Rep.), 1925-. (H. Bu.)

**RHODES, JAMES FORD** (1848- ), American historian (see 23.257), was awarded in 1910 the gold medal of the National Institute of Arts and Letters. He published in 1913 *Lectures on the American Civil War* (delivered at Oxford in 1912); in 1917 *History of the Civil War*, and in 1919 *History of the United States from Hayes to McKinley*, being the eighth volume of his *History of the United States*, of which the first appeared in 1893 and the seventh in 1906. A revised edition in eight volumes appeared in 1920. He also wrote *The McKinley and Roosevelt Administrations 1897-1909* (1922).

**RHODESIA** (see 23.259).—In 1923 Southern Rhodesia became a self-governing colony and in 1924 the Imperial Government took over the administration of Northern Rhodesia from the British South Africa Company. This marked the end in British Africa of rule by chartered companies. In this article the two Rhodesias are treated separately.

## I. SOUTHERN RHODESIA

The white population, which numbered 12,596 in 1904, was 23,606 in 1911, 33,620 at the 1921 census, and was estimated at 40,000 in 1926. Over 90% of the whites are of British stock, a fact which has had great influence on political developments. With the growth of the white population the already nascent aspiration of the Southern Rhodesians for self-government (officially styled responsible government) grew in strength. When the constitution of the Union of South Africa was framed, the ultimate inclusion of Rhodesia in it was contemplated, but the establishment of the Union in 1910 appeared but to increase the Rhodesian desire for independence. At that time the British South Africa Company, under its charter, exercised sovereign rights, subject to partial control by the Colonial Office. A legislative council existed and in May 1911 a step in the direction of self-government was made when Orders in Council gave the elected members a majority of the seats in the Council. By 1913 the position had been reached that the Chartered Company—of which Sir Starr Jameson was president from 1912 till his death in Nov. 1917—was willing to abandon its administrative powers on terms. At that time, however, the rise of the Nationalist (Dutch extremist) party in the Union caused much disquiet in Rhodesia, with the result that, in the elections held in March 1914, 11 of the 12 elected members were pledged to support the maintenance—for the time being—of the company's administration. The Legislative Council nevertheless declared that this did not affect its right "at any time" to the institution of self-government and in April 1914 the Council took action which led to a thorough examination of the whole question.

**Ownership of the Land.**—In 1913 the directors of the Chartered Company had declared that "the land and minerals belonged to the company," and as to minerals there was no real dispute. As to the land the Chartered Company had acted as owners and it looked to the sale of unalienated land to make good the heavy deficiencies it had incurred in its administrative

capacity. The Legislative Council held that the land was vested in the company "as an administrative and public asset only" and that on the company ceasing to exercise administrative rights all unalienated lands should go as public domain to the Government which succeeded it. In July 1914 the matter was referred to the Judicial Committee of the Privy Council for adjudication. The decision of the Judicial Committee was not given till July 29 1918. It was in favour of the Crown, but the committee also held that the company was entitled to be reimbursed for its deficits on administration. A royal commission, under the chairmanship of Lord Cave, was appointed in July 1919 to assess the amount due to the Chartered Company on the assumption that its governing powers had ceased on March 31 1918. The Cave commission gave its award in Jan. 1920. It found that the sum due to the company, subject to certain adjustments, was £4,435,000, a figure less than half that which the company had claimed.

In the six years these legal proceedings lasted the World War and political developments in the Union of South Africa have influenced Rhodesian opinion. The Rhodesians were ardent supporters of the British cause in the War and in proportion to population no community of the Empire gave a larger contingent towards its prosecution. The growth of separatist and republican sentiment in the Union, and particularly the rebellion of 1914, alienated the almost solid British population of Rhodesia. Those who had begun to favour joining the Union drew back and the strength of the movement for independence was shown at the general election in May 1920, when the responsible government party secured 12 out of 13 seats.

At this period Lord Milner, then Secretary of State for the Colonies, advocated delay, believing that Southern Rhodesia was not in a position to bear the financial burden entailed by self-government. In view, however, of the instance of the Rhodesians, recourse was had to the advice of still another committee, of which Lord Buxton, lately governor-general of the Union, was chairman. This committee acted promptly, reporting in April 1921 in favour of a referendum being taken on the question, the electors to have before them, not merely the principle of self-government, but a definite outline of the proposed constitution. The Buxton committee, however, proposed that under the suggested constitution control of unalienated land should be exercised through the High Commissioner for South Africa on the advice of a specially created land board and that this unalienated land should be charged with the sums to which the Chartered Company was entitled under the Cave award.

The method proposed for dealing with the unalienated land was open to serious objection—obviously it would fetter any Government which succeeded the Chartered Company. Nevertheless the elected members of the Legislature, under the leadership of Sir Charles Coghlan, accepted the recommendations of the Buxton committee and Rhodesian delegates came to London and conferred with Mr. Winston Churchill, who had become Colonial Secretary. A detailed scheme for submission to the electorate was embodied in draft letters patent and the delegates returned to South Africa. At the same time it was arranged that the Rhodesian electors should have before them the alternative of Southern Rhodesia becoming a province of the Union. Gen. Smuts (then Prime Minister of the Union) conducted a double set of negotiations—one with the Chartered Company, one with the Rhodesian delegates.

With the Chartered Company he negotiated for the acquisition by the Union of the unalienated lands and also of the railways both in North and South Rhodesia. In June 1922, an agreement was reached on those lines, the company to receive in all £6,826,000 as compensation. Gen. Smuts then offered generous terms to the Rhodesians, including 10 seats in the House of Assembly and certain special subsidies and development grants. The Nationalist party in the Union, for obvious reasons, looked upon this offer with disfavour.

The Union's terms were made known on July 31 1922. On Oct. 27 following, the referendum was held. Gen. Smuts, with doubtful wisdom, issued an appeal to the electors to vote for

entering the Union. The result of the referendum was: for responsible government 8,774; for joining the Union 5,989, a majority of 2,785 for responsible government.

*Self-Government Established.*—Before the new constitution was established a settlement was reached with the Chartered Company which left Southern Rhodesia in full and untrammelled possession of the unalienated lands. In July 1923 the British Govt. made an agreement with the company, which, in return for £3,750,000, surrendered its claim under the judgment of the Judicial Committee and the Cave award both in Southern and Northern Rhodesia, while retaining its mineral rights and the promise of protection for its railway interests. Of this £3,750,000 (paid in cash on Oct. 1 1923) the British Govt. provided £1,750,000 while Southern Rhodesia paid £2,000,000 (raised by loan) and also repaid the British Govt. £300,000 which it had advanced the company to meet administrative liabilities. The British Govt.'s contribution was substantial evidence of its goodwill towards the people of Rhodesia.

On Sept. 12, the 23rd anniversary of the occupation of Mashonaland, Southern Rhodesia was formally annexed to the British Crown and on Oct. 1 the new constitution was set up. The Chartered Company, whose rule thus ended, had done a great work in opening up the country and had also—though some abuses had been permitted—sought with success to benefit the native races.

The first governor under responsible government was Sir John Chancellor and the first ministry was formed by Sir Charles Coghlan. The country was divided into 15 two-membered constituencies and at the general election held on April 29 1924 the Government (Rhodesian) party gained a decisive majority, nearly all the electors who at the referendum had voted for joining the Union working whole-heartedly to make the new constitution a success. One of the elected members was a woman, Mrs. Tawse Jollie, who had previously held a seat in the old Legislative Council. The franchise is exercised by both sexes and there is no colour bar; Africans and Asiatics could and did obtain the parliamentary vote, though the number of these electors was few. The country prospered and good relations were maintained both with the Union and with Portuguese East Africa—a matter of moment to a country without a seaboard. The chief concern of the ministry, apart from land settlement and agricultural development generally, was that of control of the railways. Negotiations with the Chartered Company on this matter took place in 1926.

*Native Affairs.*—Under the new constitution the authority and control of the High Commissioner for South Africa (representing the Imperial Govt.) in respect to native affairs was retained. A commission under Mr. (afterwards Sir) R. T. Coryndon was appointed in 1914 to inspect and report on the native reserves. White settlers had complained that certain lands in native occupation were not beneficially used; the natives made similar complaints. The Coryndon commission recommended a number of readjustments, making the total of the native reserves 19,428,691 ac., a net reduction of 1,062,460 acres. These recommendations were accepted by the Imperial Govt. in 1917 and were gradually carried out, with little friction. (To ensure the natives' security of tenure the reserves are vested in the High Commissioner and are inalienable.) Another commission was appointed by the governor in Jan. 1925 to consider setting apart areas of the public domain outside the native reserves for settlement by natives or colonists. This commission reported in 1926 in favour of segregation with some modification of the 38,560 sq. m. available outside of town areas. They proposed that 10,830 sq. m. should be allotted for native settlement, leaving 27,730 sq. m. assignable for white settlers.

Meanwhile charges against the Chartered Company's native administration were formulated by the Aborigines Protection Society. It was admitted that cases of grave injustice had occurred in the earlier history of the territory, but for many years there had been no cause of complaint and in Aug. 1919 Lord Buxton paid a high testimony to the Company's native administration and the attitude of the civil population generally

to the natives. The value of the natives as an asset to the country is now generally recognised. Agricultural and industrial training as well as literary education are provided, and much care in regard to housing, sanitation and labour conditions is bestowed on natives living outside the reserves. Taxation is light, £1 a year on every male adult, but should a native have more than one wife he pays a further 10s. for each additional wife.

*Economic Conditions.*—The country was affected by the same causes which affected the material progress in the Union, but not so severely as far as adverse factors were concerned. Rhodesia has a very wide variety of products and these were developed with much energy. Gold continued to be of more value than any other single export. The highest export was in 1916 when there was a yield of 930,000 oz. valued at £3,895,000. In 1924 the yield was 627,000 oz. valued at £2,939,000. The Wankie coal fields yielded 180,000 tons in 1910 and 652,000 tons in 1924; all consumed in the country. About half of the world's supply of chrome iron ore comes from Southern Rhodesia (the output was 172,000 tons in 1924) which has also very valuable asbestos deposits. The output of asbestos increased from 290 tons in 1910 to 26,000 tons (valued at £603,000) in 1924.

Of crops the chief are maize and tobacco. As in the Union the maize crop has violent fluctuations according to weather conditions—thus the maize exported in 1922 was but 6,492,000 lb.; in 1924 it was 63,657,000 lb. and had been 157,253,000 lb. in 1923. Rhodesian tobacco finds a steady market and the output in 1924 had reached almost 5,000,000 lb. Since 1922 there has been a promising development in cotton growing and an expansion in the cultivation of citrus fruit for export. Large areas are very favourable for cattle breeding and the raising of cattle for export became a leading occupation. Over 50,000 animals were exported in 1924, but in that year by a convention with the Union, exports were limited to slaughter cattle of good class.

In general exports exceed imports in value. The figures for 1914 were: imports, £3,731,000; exports, £4,130,000; in 1924-5 imports were £4,054,000; exports, £5,120,000 (not reckoning imported goods to the value of £435,000 re-exported); In 1920, a year of abnormal activity and inflated prices, the imports had a recorded value of £7,212,000, while exports were valued at £5,735,000. About half of the imports, which are largely foods and drink and clothes, are from the Union, which takes roughly a quarter of the exports. Most of the rest of the trade is with Great Britain.

Under the Chartered Company's rule revenue increased from £777,000 in 1913-4 to £1,520,000 in 1923-4. Up to 1919-20 expenditure had exceeded revenue. In that year the deficit had been reduced to £1,113 and in 1923-4 the surplus was £164,000. The first budget (1924-5) under self-government showed a surplus, revenue being £1,598,000 and expenditure £1,594,000. For 1925-6 the budget figures showed revenue at £1,582,000 and expenditure at £1,716,000, but the year actually closed with another surplus.

## II. NORTHERN RHODESIA

Northeastern and Northwestern Rhodesia were amalgamated in 1911, being thereafter known as Northern Rhodesia simply. In 1924 the white inhabitants numbered 4,182 and the native population was estimated at 1,000,000. The capital is Livingstone (white population 774) on the Zambezi above the Victoria Falls. On April 1 1924, in accordance with arrangements made with the British South Africa Company in the previous July, the British Govt. took over the administration, the first governor being Mr. (later Sir) Herbert J. Stanley. The greater part of the territory is a natural "black man's reserve"—and Barotseland (*q.v.*) is a legal native reserve. Most of the Europeans live in the neighbourhood of the railway which traverses the centre of the territory from the Victoria Falls to the Katanga province of Belgian Congo. Geographically and climatically Northern Rhodesia is part of Central Africa.

Its political future remained uncertain in 1926. Union with Southern Rhodesia or a closer connection with the British East African territories were the alternatives.

Development was hampered by the lack of funds, which was specially marked in the native services. The tribes were governed as far as possible through their own chiefs. Though numbering only about a million the natives are divided into many tribes and 30 different languages are spoken. Christianity made many converts, but among the more primitive tribes witchcraft, with its blighting influence, retained its hold. The most promising feature was the confidence placed by the people in the native commissioners and the missionaries. During the World War the natives gave great help by furnishing over 150,000 carriers for the campaign in East Africa while numbers joined the combatant ranks. It was in Northern Rhodesia too that the last act of the War was played, Von Lettow surrendering to the magistrate at Kasama on Nov. 14 1918.

*Economic Conditions.*—The Europeans are engaged chiefly in farming, including cattle raising, in the areas not affected by the tsetse fly. The chief crop is maize, but since 1922 large areas have been devoted to cotton. In the northeast district, round Fort Jameson, tobacco is the staple crop. The country is rich in minerals. At Broken Hill there are very large deposits of lead and zinc; a dam on the Mulunguiki river to provide electric power for the mines was opened in 1925. At Bwana Mkubwa are copper deposits, an extension of the great copper area in the adjoining (Belgian) Katanga province. The transport of copper from the Kalanga mines to Beira is the chief source of railway revenue, while North Rhodesia supplies many of the needs of the Katanga market.

The trade returns indicate the progress made. Imports in 1911 were valued at £168,000, in 1921 at £741,000 and in 1923 at £528,000. Exports were valued at £107,000 in 1911, at £565,000 in 1921 and at £463,000 in 1923. In opening up the country the Chartered Company's administrative expenditure naturally exceeded revenue. For the last year of their rule (1923-4) the revenue was £278,000 and expenditure £323,000. The figures for 1910-1 had been, revenue £101,000, expenditure £173,000. By the arrangement made with the British Govt. for surrendering their administrative rights in both Rhodesias it appeared that they received, on Northern Rhodesia's account £1,450,000, besides retaining an interest in land sales. In taking over the administration the British Govt. made a loan grant in aid of £138,000 to the territory. An elective but purely advisory council had been established in 1913; under the Crown this was replaced by a legislative council of 10 official and 5 unofficial (elected) members.

*BIBLIOGRAPHY.*—1. *Official.* Full lists of parliamentary papers relating to Rhodesia are given in the *Colonial Office List* (London, yearly); and annual reports are issued by the British South Africa Company. The first issue of the *Year Book of the Colony of Southern Rhodesia* was published (at Salisbury, Rhodesia) in 1924. *The Report of the East Africa Commission* (1924) has a chapter on Northern Rhodesia.

2. *Unofficial.* C. Gouldsbury and H. Skeane, *The Great Plateau of Northern Rhodesia* (1911); A. Darter, *The Pioneers of Mashonaland* (1914); H. Rolin, *Les lois et l'administration de la Rhodésie* (Brussels, 1918); J. H. Harris, *The Chartered Millions* (1920); J. C. C. Coxhead, *Northern Rhodesia: A Handbook* (Livingstone, 1922); *Guide to Rhodesia*, 2nd ed. (1924); *The South and East Africa Year Book and Guide* (annually). (F. R. C.)

**RHODES SCHOLARSHIPS** (*see* 23.254).—The scholarship system founded by the will of Cecil Rhodes, proved in 1902, provided for the maintenance in perpetuity at Oxford of about 200 selected scholars for a term of three years each. Under the will the value of each scholarship was £300 a year, but this has since been raised to £400 a year. Thirty-four scholars come each year from the British Empire, distributed substantially as follows. One scholar is elected annually from each province or state of the Dominions of Canada, Australia and South Africa; from four specified schools in the Cape Province of South Africa and from the colonies of Newfoundland, Jamaica and Bermuda. Rhodesia elects three scholars each year, and Malta one every third year. Thirty-two scholars are elected annually from among

the 48 states of the United States. Five annual scholarships were allotted to Germany, but were annulled during the War.

In his will Rhodes mentions the objects he had in view in founding the different scholarships:—

1. *Colonial*.—"I consider that the education of young colonists at one of the universities of the United Kingdom is of great advantage to them for giving breadth to their views, for their instruction in life and manners and for instilling into their minds the advantage to the Colonies as well as to the United Kingdom of the retention of the unity of the Empire."

2. *American*.—"I also desire to encourage and foster an appreciation of the advantages which I implicitly believe will result from the union of the English-speaking people throughout the world, and to encourage in the students from the United States of North America who will benefit from the American scholarships to be established for the reason above given at the University of Oxford under this my Will an attachment to the country from which they have sprung, but without, I hope, withdrawing them or their sympathies from the land of their adoption or birth."

3. *German*.—"The object is that an understanding between the three Great Powers will render war impossible and educational relations make the strongest tie."

Rhodes believed that his objects would be best attained by bringing together for education at Oxford young men selected for certain qualities which he defined as follows:—

"My desire being that the students who shall be elected to the scholarships shall not be merely bookworms, I direct that in the election of a student to a scholarship regard shall be had to (a) his literary and scholastic attainments; (b) his fondness for and success in mainly outdoor sports such as cricket, football and the like; (c) his qualities of manhood, truth, courage, devotion to duty, sympathy for and protection of the weak, kindliness, unselfishness and fellowship; and (d) his exhibition during school days of moral force of character and of instincts to lead and to take an interest in his schoolmates, for those latter attributes will be likely in after life to guide him to esteem the performance of public duties as his highest aim."

*Method of Selection*.—Subject to ratification by the Trustees, the nomination of scholars is in the hands of representative local committees, which are appointed by the trustees, and on which ex-Rhodes scholars sit. In general candidates must be citizens of the country, Dominion or Colony, which they are to represent, with at least five years' domicile, and unmarried; and they must have passed their 19th and not have passed their 25th birthday by Oct. 1 of the year for which they are elected. There are no qualifying examinations: candidates are judged on their records and after a personal interview with the selection committee. But, except in four exceptional cases, candidates are obliged to have attended a recognised degree granting college or university for two years at least. At Oxford the scholars are distributed, as Rhodes desired, among all the colleges at the university, as far as possible in accordance with their own wishes, but acceptance of any scholar is determined ultimately by the colleges themselves. No college undertakes to accept more than a limited number of Rhodes scholars in any one year—the number varying from two to five. The offices of the trust are at 17, Waterloo Place, London, S.W.1. (P. K.)

**RHONDDA, DAVID ALFRED THOMAS**, 1ST VISCOUNT (1856–1918), British colliery owner and politician, was born March 26 1856 in Aberdare. His father, a Merthyr grocer, had prospered in his trade, and in later life enriched himself by speculations in coal. Thomas was educated at Clifton College, and Caius College, Cambridge, where he graduated in the mathematical tripos in 1880. Immediately he joined his father in the coal business, into which he threw himself with great energy and ability. His extraordinary commercial gifts, his insight, his foresight and the sympathy which he brought to bear on conditions of life in the mining industry, soon made him a prominent, and eventually the leading, figure in the industrial world of South Wales. His business combinations brought him great wealth, and culminated in the Cambrian supercombine, which produced some 6,000,000 tons of steam coal a year.

Though he had sat as a Liberal for Merthyr Tydvil for 22 years from 1888, and for Cardiff for a few months in 1910, Thomas achieved no political importance till the outbreak of the World War, when he rendered substantial help to Mr. Lloyd

George, both at the Exchequer and at the ministry of munition by organising British industrial resources. He took a lead in "capturing German trade," carrying through, for instance, the acquisition of the Sanatogen business. He went to America to complete important war contracts for the Government, and on his return was saved, with his daughter, Lady Mackworth, from the sinking of the "Lusitania." He went back to America almost immediately, and spent seven months there at his own expense, expediting the output of munitions. He was created a baron, as Lord Rhondda, for his services, in Jan. 1916; and took office in Mr. Lloyd George's Ministry in the following Dec. as President of the Local Government Board, passing to the Food Controllorship in June 1917. There he immediately took strong steps to put an end to speculation in the necessities of life; he gradually fixed prices and brought supplies under control.

But he will be mainly remembered as the author of the system of compulsory food rationing, which was carried out with absolute fairness and impartiality. The turnover of his Ministry, apart from the work of the wheat and sugar commissions, amounted to £1,200 millions sterling; with them £2,733 millions sterling. Supplies never failed, and in spite of the German submarines there was no hunger in the United Kingdom. His strenuous labours affected his health, and in April 1918 he tendered his resignation; but pressure was put upon him to remain. He was attacked by pneumonia and died on July 3 at Llanwrn, Monmouthshire. Just previously he had been created a Viscount. He married Sybil Margaret Haig, a cousin of Lord Haig. Their only child, a daughter (who married Sir Humphrey Mackworth in 1908, and obtained a dissolution of their marriage in 1923), succeeded to the viscounty of Rhondda under a special remainder. In 1921 Lady Rhondda published a *Life* of her father.

**RHYS, SIR JOHN** (1840–1915), British archaeologist and scholar, was born in Cardiganshire, Wales, June 21 1840. Educated at Bangor normal college and Jesus College, Oxford, he continued his studies on the European Continent. In 1877 he was elected the first professor of Celtic at Oxford, becoming in 1895 principal of Jesus College. He was Hibbert lecturer in 1886, Rhind lecturer on archaeology at Edinburgh in 1899 and president of the anthropological section of the British Association in 1900. Knighted in 1907, he died at Oxford Dec. 16 1915. Among his published works are *Lectures on Welsh Philology* (1877); *Celtic Britain* (1882, 1904); *Celtic Heathendom* (1886); *Studies in the Arthurian Legend* (1891); *The Welsh People* (with D. B. Jones, 1900); *Celtic Folk-lore* (1901).

**RIAZ PASHA** (c. 1835–1911), Egyptian statesman (see 23.281), died June 18 1911.

**RIBOT, ALEXANDRE FÉLIX JOSEPH** (1842–1923), French politician (see 23.285). In 1909 M. Ribot left the chamber for the Senate and four years later was a possible candidate for the Presidency of the Republic. In June 1914 M. Poincaré summoned M. Ribot to form a cabinet. He succeeded in doing so but the new Government under his premiership fell on the vote of the first ministerial declaration. He returned to office in Aug. 1914 as Minister of Finance in M. Viviani's reconstituted Ministry of National Defence. He held the same office in the Ministry formed by M. Briand on Oct. 29 1915 and again in the reduced cabinet of Dec. 1916. In March 1917 he succeeded M. Briand as Prime Minister and Minister of Foreign Affairs. He gave way in Sept. of the same year to M. Painlevé in whose Government he retained the Ministry of Foreign Affairs, which he resigned in the following month. Between the Armistice and 1923 he was prominent in upholding French claims to reparations and in warning his countrymen of the difficulties that would ensue if the payments were not made. M. Ribot was a member of the Académie Française and of the Académie des Sciences Politiques et Morales. He died in Paris Jan. 13 1923.

**RIBOT, THÉODOLE ARMAND** (1839–1916), French psychologist (see 23.286), died in Paris Dec. 9 1916.

**RICE**: see FOOD SUPPLY.

**RICHARDS, THEODORE WILLIAM** (1868– ), American chemist, was born at Germantown, Pa., Jan. 31 1868. He was

educated at Haverford College (S.B., 1885), Harvard University (A.B., 1886; Ph.D., 1888), Göttingen, Leipzig and the Dresden Technical School. After passing through the various grades of promotion, he was appointed professor of chemistry at Harvard in 1901, and was made director of the Wolcott Gibbs memorial laboratory in 1912. He was best known for his researches on atomic weights, of which he revised over a score, including that of uranium-lead. The results were generally accepted, and for his contributions he received the Nobel Prize in chemistry in 1914. He also gave much time to physicochemical investigation, especially concerning electrochemistry and chemical thermodynamics, piezochemistry and surface tension. Of these, his contributions to atomic compressibility, to the relation between the change of heat capacity and the change of free and total energy and to the thermodynamics of amalgams are noteworthy. In 1907 he was Harvard exchange professor at Berlin, and in 1908 Lowell lecturer. He was made a member of the National Research Council in 1916, and became consulting chemist in the Dept. of War and Bureau of Mines 1918. He was president of the American Chemical Society (1914), the American Association for the Advancement of Science (1917) and the American Academy of Arts and Sciences (1919). (See ATOMIC WEIGHTS.)

**RICHBOROUGH**, England (see 4.584), a port on the estuary of the Stour, in Kent,  $1\frac{1}{2}$  m. from Sandwich, was established during the World War to relieve the traffic in military stores through Dover. Work was started in 1916 with the widening and deepening of the Stour, and the cutting of a canal across a large bend; 250 ac. of sea marsh were then reclaimed, and nearly a mile of wharfrage built and equipped. In six months from the start of the work, which at one time occupied 20,000 hands, regular cross-channel services of barges to Calais and Dunkirk were begun, and later special barges were introduced to take goods direct into the French canals and as near the firing line as possible. The base, begun in a comparatively small way, developed into a gigantic undertaking. In 1917 three special train ferries, each accommodating 54 ten-ton trucks, were constructed, with a lifting bridge at the wharf end. They are now in use on the Harwich-Zeebrugge route. In 1925 the port of Richborough with 1,500 ac. of land, the remaining equipment, and the fleet of ferries and barges, was sold to Messrs. Pearson and Dorman Long for development in connection with their undertakings in the Kent coalfields. There were only 10 residents in the parish of Stonar, in which Richborough is situated, in 1921.

Richborough Castle, where important archaeological excavations are in progress, is one of the most remarkable monuments of the Roman occupation of Great Britain. It marked the beginning of Watling Street, and guarded the wide channel of the Wantsum, then separating the Isle of Thanet from the mainland. Richborough (*Rutupiae*) was a landing place and base for Roman legionaries, and the foundations of its buildings lie to the west of the castle walls. The extant remains of the castle include the north wall of the castellum, 460 ft. long and 22 ft. high. In the centre of the enclosure is a cruciform platform of concrete, 144 ft. long and 104 ft. wide, on a square stone foundation; its purpose is uncertain, but it is believed to have borne a lighthouse. A subterranean passage runs round the foundations of the platform.

**RICHMOND, SIR WILLIAM BLAKE** (1843-1921), British painter (see 23.307), died at Hammersmith, London, Feb. 11 1921.

**RICHMOND**, Va., U.S.A. (see 23.309).—The population increased 34.5% in the decade after 1910, reaching 171,667 in 1920 (88.6 males to 100 females), of whom 54,041 were negroes and 4,713 foreign born. According to an estimate of the U.S. Census bureau, the population had reached 186,403 in 1925 with an additional 30,000 or more in the immediate suburbs. Annexations of territory brought the area to 24 sq. m. by 1920. Richmond was selected as the seat of the Federal Reserve Bank of the Fifth District. Bank clearings reached \$3,053,232,722 in 1920, and averaged about \$2,750,000,000 per year for the period 1920-4. Manufactures were valued at \$47,358,000 in 1909; \$156,724,000 in 1919; and \$146,412,589 in 1923. The leading industries, after tobacco, were the manufacture of iron and steel products, wooden articles, blotting paper and fertilisers; and print-

ing and publishing. Industrial power was available from three hydroelectric plants, and additional developments were underway.

Modifications in the charter in 1919 provided for five departments in the city government, each with a director appointed by the mayor, subject to confirmation by the city council, these five directors, together with the mayor, forming an advisory board to administer the affairs of the city. Improvements up to 1925, in view of a possible population of 350,000 within 25 years, included the rebuilding of the gas works, the installation of a system of high-pressure water supply, additions to the filtration plant, the protection of the lower areas against flood, the construction of new bridges, the development of a city plan and adoption of zoning ordinances, the erection on an average of two new school buildings each year, and projects for improving the harbour facilities and for straightening the river and establishing a 30-ft. channel to Hampton Roads. The number of pupils in the public schools reached 35,000 in 1924, including 3,500 attending evening classes.

**RICHTER, HANS** (1843-1916), Hungarian musical conductor (see 23.312), died at Bayreuth Dec. 5 1916.

**RICKETS**: see ORTHOPAEDIC SURGERY.

**RICOTTI-MAGNANI, CESARE** (1822-1917), Italian general (see 23.316), died at Novara Aug. 4 1917.

**RIDDELL, GEORGE ALLARDICE RIDDELL, 1ST BARON** (1865- ), British newspaper proprietor, was born in London May 25 1865 and educated privately. He became a solicitor in 1888 and settled in practice at Cardiff. There he acquired an interest in *The Western Mail*, and he eventually turned his energies mainly to newspaper management. He went to London and obtained control over the Sunday paper *The News of the World*, which he developed on popular lines, so that it obtained a huge circulation during the first decade of the 20th century and made its proprietor a wealthy man. He gradually extended his newspaper connections, becoming a director also of George Newnes Ltd., Country Life Ltd. and C. Arthur Pearson Ltd., etc. In 1909 he received a knighthood. He was a prominent member of the Newspaper Proprietors' Association at the outbreak of the World War, and, owing to his intimate relations with Mr. Lloyd George, he gradually became the principal liaison between the Press and the Government so far as all matters of publicity were concerned. In this capacity he represented the British Press at the Peace Conference in 1919 and at all the important Allied conferences subsequently. He was created a baronet in 1918 and raised to the peerage as Baron Riddell of Walton Heath in 1920. His publications include *Some Things That Matter* (1922) and *More Things That Matter* (1925). (See CENSORSHIP.)

**RIDING** (see 23.317).—In the earlier days of motoring, riding, as apart from hunting and polo, received a somewhat severe setback. But the decrease in the number of those who rode merely for pleasure was not of long duration, and even before the War there were signs that horsemanship was still a desirable accomplishment, while during the years that have passed since the War there has been a marked increase in the number who ride. In Great Britain the increased interest in riding is due to the admirable series of horse shows which are now held all over the country. Not that the horse show is in itself a novelty, but rather because there has of late years been a determined attempt by the executives of the more important shows to include more riding classes in their programmes, and to make such classes more attractive. The army equestrian schools have developed to an extraordinary degree, and there is a considerable body of public opinion which favours "school" riding, not only as a part of education in horsemanship, but as an aid to successful riding in the hunting field. The facts which have most bearing on the future of riding are the great increase in the number of horsewomen, both in the hunting field, at the show and in the country generally, and the increase in the number of children's riding classes at the shows. These have multiplied 10 times in as many years, and are at the present day not only some of the most interesting, but the most popular of all the riding classes, high-class jumping alone excepted.

**RIF CAMPAIGNS**: see MOROCCO, CAMPAIGNS IN.

**RIFLES AND LIGHT MACHINE GUNS** (see 23.325).—The small arms used by modern armies may be grouped into rifles, light machine guns, machine guns and heavy machine guns. For the two latter see the article **MACHINE GUNS**. Light machine guns are also known as light automatics (Great Britain), *fusils mitrailleurs* (France) and machine rifles (United States).

### I. THE MILITARY RIFLE

**Definition.**—A rifle so constructed as to constitute a complete offensive and defensive arm for one man and of such a size and weight that one man can carry it, together with its ammunition and accessories and the other essentials that a soldier is required to carry, over the ground and distances he is expected to cover in war. The weight of the military rifles of most countries averages 9 lb. without bayonet, which weighs about 14 ounces. The ammunition carried by each man varies from 100 to 150 rounds and weighs from  $5\frac{1}{2}$  to  $8\frac{1}{2}$  lb. inclusive of the metal clips or chargers, each of which holds five rounds. Subject to minor variations, the military rifles of the principal nations are of the following distinct types: Short Lee-Enfield (British), Mauser (German), Mannlicher (Austrian), Lebel (French), Krag Jorgensen (Norwegian and Danish), Schmidt Rubin (Swiss), Three Line (Nagant) (Russian), and Springfield (United States).

**Great Britain.**—In 1902 the first short magazine Lee-Enfield .303 Mark I. rifles (S.M.L.E.) were issued for the British service, and by 1907 this rifle had been improved and advanced to Mark III. Further improvements in matters of detail were under consideration in 1926, but no alterations in the main features of the "action" were contemplated. Mark VII. ammunition was introduced in 1910. The bullet is lighter than that of the Mark VI., has greater muzzle velocity and flies on a much flatter trajectory, thereby increasing the probability of hitting a given mark. Before the World War, however, still greater velocities and flatter trajectories were being sought for and obtained by continental nations. The problem was taken up by the British War Office, and a rifle, bored to .276, was issued in limited numbers for trial by the troops. The ammunition

for this rifle had a rimless cartridge, a lighter bullet than the Mark VII., with much greater velocity but with much increased chamber pressure. To cope with this greater chamber pressure, a rifle was designed with a front locking action similar to that of the Mauser, which was considered stronger and better able to withstand the firing stresses. The experiment was interrupted by the outbreak of war, and the suggested change from .303 S.M.L.E. Mark III. to the new .276 was abandoned.

When the War began the number of men enlisted soon reached a figure far in excess of that for which provision had been made, and to provide them with a rifle for home defence and even training purposes became a pressing necessity. Accordingly, large orders were placed in America for the .276 design of rifle, the only departure from the original being that it was bored to take the .303 Mark VII. ammunition. This rifle was then issued to the troops and became officially known as the "British Rifle, Pattern 1914" (see fig. 1). It is very accurate, and, when provided with a telescopic sight, is used for "sniping," in which accuracy rather than rapidity of fire is the main desideratum. It was the only new design of rifle adopted by any of the belligerents during the War for use by rank and file. Being manufactured in America, this pattern, bored to take the American .3 ammunition, was issued to American troops when it became necessary to augment the supplies of the United States Springfield service rifle.

**France.**—In the Lebel, first issued in 1886 and still the service rifle in 1914, the magazine, which held 8 rounds, consisted of a tube with spring plunger, underneath and parallel to the barrel. This system proved to have many drawbacks, and accordingly in 1915 a box magazine of conventional type was substituted for the tube.

**Germany.**—During the War, carbines (*i.e.*, very short rifles for mounted troops) were issued to troops in the trenches, apparently with the object of equalling if possible the lightness and handiness of the British S.M.L.E. The main features were identical with those of the ordinary service Mauser rifle, but by reducing the diameter of the body and barrel and shortening the barrel and stock the weight, as compared with the rifle,

FIG. 1.—.303 in. magazine rifle, Enfield pattern (1914). 1. Striker. 2. Extraction cam. 3. Fixed sight aperture. 4. Wings protecting backsight. 5. Backsight spring. 6. Backsight bed. 7. Charger guides. 8. Sear safety stud. 9. Striker, front collar. 10. Body hood. 11. Bolt, split lug. 12. Ring retaining handguard. 13. Body rib. 14. Trigger guard, front screw. 15. Trigger, 2nd point on head. 24. Trigger, 1st point on head. 25. Cocking piece bent. 26. Sear spring. 27. Magazine platform. 28. Magazine spring.

was reduced from 9 lb. to 7 lb. 13 oz. and the length from 49½ in. to 43½ inches.

After the first appearance of the tanks in the War, the Germans introduced a new form of weapon, the .5-in. anti-tank rifle, intended for use against tanks only. It was provided with very powerful ammunition, having a high velocity, heavy, armour-piercing, streamline bullet of 801 grains, the extreme range of which has been found to be 7,000 yards. (The ordinary German Spitz rifle bullet weighs 155 grains.) This rifle had a single loading Mauser action without a magazine and, to cope with such ammunition, had to be correspondingly strong and heavy. It weighed 37 lb., was provided with a bipod mounting and was served by two men carrying 124 rounds of ammunition. Periscopic attachments, wire cutting devices and mountings of various kinds were common in all armies during the War, but most of them have since been discarded.

*The Automatic Rifle.*—An automatic rifle is one in which the operation of reloading is performed by power derived from the explosion of the charge. In order to rank as a complete offensive and defensive weapon it should take the same ammunition and give the same ballistics and efficiency as the ordinary rifle and also lend itself to effective use in close combat when fitted with a bayonet.

The automatic rifle, though undergoing continuous development, had not in 1926 reached such a degree of efficiency as to warrant its adoption. It has been found best not to make the automatic rifle capable of continuous fire, which in a light weapon with great recoil energy would be unpleasant to the user and very disturbing to the aim. Moreover the injudicious use of continuous fire would make still more difficult the replenishment of ammunition supplies. Accordingly the term "automatic" is perhaps unsuitable, and "semi-automatic" or "self-loading" would more aptly describe rifles of this type, in which, for each pull of the trigger only one round is fired.

## II. THE LIGHT MACHINE GUN

*Definition.*—A truly automatic (self-firing) firearm, which is portable but too heavy to be adapted for use as a close-combat weapon. The increased weight (17 to 28 lb.) makes the recoil energy less than that of the rifle, and a rest is provided at the front end which keeps the continuous fire it delivers reasonably accurate under ordinary conditions. To make the best use of this weapon much ammunition must be carried and it is accordingly manned by a team, one man carrying the gun and the others ammunition, spares and accessories.

*Light Machine Guns in the World War.*—Prior to 1914 the main armament of infantry in all armies was the rifle (with bayonet), and the machine gun averaging 40 to 50 lb. in weight, on a fixed mounting. The light machine gun was a product of the trench warfare of the World War. When trench warfare started the power of manoeuvre disappeared and it was no longer possible to establish a superiority of fire in "the fire fight" by skilful tactics. Superiority in fire power from small arms had to be secured by other means, and hence arose a greater demand for automatic weapons, which, manned by a few men, develop a fire power equivalent to that of a considerable number of men armed with rifles. Further, in the battles fought in the early days of trench warfare, the muddy state of the ground, the obstacles which had to be surmounted and the heavy weight of the existing machine gun with its mounting, frequently prevented the gun team from getting the gun forward into position after an attack. Lightness and mobility were even more important than accuracy and capacity for sustained fire. Accordingly, the light machine gun definitely took its place in the equipment of the armies of most of the countries of the world.

Some of the principal light machine guns employed in the World War and some of the newer types are tabulated below with a few details.

TABLE I. *Light Machine Guns Used in the World War*

| Country      | Britain                        |                                                             | France                                         |                                                                   | Germany                      |                                               |                                               | U.S.A.                                 |                                                              |

<sup>1</sup> More a sub-machine gun than a light machine gun. <sup>2</sup> Into right side.

All these automatic weapons are operated either by gas or recoil.

**Gas Operated Guns.**—All gas-operated weapons are practically identical in principle, and where differences occur they are usually in matters of detail, the merits of which vary accordingly as they are efficient and cheap, permit of easy manufacture, maintenance and manipulation and are readily understood. Typical of gas-operated weapons is the Lewis gun (see fig. 2).

**Recoil Operated Guns.**—In recoil operated light machine guns, the mechanical systems employed are more varied than are those used in gas operated weapons; and there is no general principle to which they closely adhere. A feature common to all, however, is the recoiling barrel which overcomes the resistance of antagonistic springs. These, at the finish of its backward travel, return the barrel to its forward position. The length of recoil varies in different guns from about one inch to

FIG. 2.—Lewis Gun. Total length 50 inches. 1. Backsight. 2. Receiver. 3. Bolt. 4. Extractor. 5. Striker fixing pin. 6. Striker. 7. Feed operating arm. 8. Magazine latch. 9. Magazine top plate. 10. Radiator casing. 11. Barrel. 12. Radiator. 13. Barrel mouthpiece. 14. Gas chamber. 15. Gas regulator cup. 16. Gas regulator key. 17. Gas cylinder. 18. Piston. 19. Rack. 20. Main-spring. 21. Gear. 22. Charging handle. 23. Trigger. 24. Feed operating stud. 25. Sear. 26. Ejector cover. 27. Ejector.

The principle usually adopted in gas-operated weapons is to divert the gas, which is forcing the bullet up the barrel, through a small hole into a gas chamber, and thence on to a piston situated underneath the barrel and free to work parallel to it. On discharge, the piston is driven back, compressing antagonistic springs. At the end of the backward travel, the springs force the piston again to its forward position ready for the next blast of gas to take effect. On its backward journey the piston operates the mechanism for feeding the cartridges into the gun, so that when the piston is fully back, a round is ready for gathering and insertion into the chamber as the piston again goes forward. The piston on going forward brings about the locking of the mechanism against the shock of discharge and the firing of the round, which by that time is fully home in the chamber. Such a system is known as "positively locked," and "mechanically safe" an essential feature of which is that it is impossible for a round to be fired until after the locking has been com-

pleted. Moreover, after the explosion of the charge, no unlocking of the action can take place until the bullet is clear of the barrel, and there is no longer any pressure of gas.

five inches; consequently they are classified as "long" or "short" recoil. (The length of recoil is shown in the table.) Another common feature is that the barrel and bolt (or lock) are mechanically locked together for a certain length of the recoil, thereby sealing the breech till the bullet is clear.

In "long recoil" actions, the bolt, having come back with the barrel, is held in its rearmost position, with the extractor engaged behind the rim of the cartridge which is still in the chamber. Accordingly, as the barrel moves forward under the influence of the springs which have been overcome in the backward travel, the round is withdrawn from the breech and ejected. The Chauchat (see fig. 3) is a type of the "long recoil" guns.

In "short recoil" actions, such as that of the Bergmann gun (see fig. 4) of about one inch barrel movement, mechanism is provided whereby the bolt, locked to the barrel for a certain length of recoil (created by firing), is unlocked and withdrawn

FIG. 3.—Chauchat light machine gun (long recoil). Total length 45½ inches.

pleted. Moreover, after the explosion of the charge, no unlocking of the action can take place until the bullet is clear of the barrel, and there is no longer any pressure of gas.

The gas chambers are usually designed with a view to enabling the volume of gas that strikes on the piston to be controlled, thus permitting of a reserve of power should friction or other conditions arise which might tend to impede or cause incomplete movement of parts.

about three in. from the barrel after the latter has completed its inch of recoil. In this separation of bolt and barrel, extraction and ejection of the empty cartridge case is effected, and a new round is inserted into the chamber.

The Madsen action does not conform to the above description, for in it the separation of breech from bolt is effected by guiding the bolt away from the breech in a vertical plane, the bolt being pivoted in rear to permit of this movement.

FIG. 4.—Bergmann light machine gun (short recoil). Total length about 48 inches.

In "short recoil" guns, the recoil and return of the barrel is the source of power for operating the mechanism which brings about the feeding of the cartridges into the gun, in the same way as does the piston in gas operated weapons. Normally, for such guns, the rounds are contained in a belt which is mechanically led through the gun, the rounds being withdrawn from it during its passage. In "long recoil" weapons, the system of feed is normally by magazine, the rounds being pushed by a spring inside the magazine into the space which is created when the bolt remains back as the barrel goes forward.

*The Sub-Machine Gun.*—The sub-machine gun is a kind of automatic pistol, but heavier, more powerful, and with a longer range than the usual pattern. It is capable of a high rate of fire but is lighter than other automatics. The ammunition resembles pistol ammunition. In the gas operated Thompson

FIG. 5.—Thompson sub-machine gun. Total length 23 inches.

sub-machine gun (see fig. 5) the breech is sealed by the agency of adhering inclined surfaces on those portions of the mechanism which support the bolt against the gas pressures generated within the barrel. (H. R. A.)

**RIGA**, Latvia (see 23.337), the capital and the only large town of Latvia, and one of the three principal ports, had an area of 90 sq. km., and a population of 327,176 in 1925, as compared with 520,000 before the World War. Some 54% were Latvians and only about 8% Russian, but the Russian language is much used, and Latvian comparatively little understood. Although an important and well-organised industrial centre before the War with a large trade with Russia, industry was at a low ebb in 1925: the transit trade with Russia was small, and showed little prospect of improvement. Much of the factory equipment was removed during the War, when the town was damaged by bombardment. Riga remains, however, the industrial centre of Latvia and had 501 manufacturing establishments in 1921, whilst 87% of the trade of the country goes through the port. An agricultural and industrial fair is held yearly. Little building has been done. A scheme has been put forward for developing power for lighting, trams and factories from the Dvina river, but no decision had been taken in 1925. The Riga polytechnic was made into a university in 1919, Dorpat University, which previously served all the Russian Baltic provinces, having become Estonian property. An international exhibition was held in 1924.

**RILEY, JAMES WHITCOMB** (1853–1916), American poet (see 23.343), died at Indianapolis, Ind., July 22 1916. In 1915, by proclamation of the governor of Indiana, his birthday, Oct. 7, was observed throughout the State, in honour of "Indiana's

most beloved citizen." In 1913 he issued in six volumes a biographical edition of his works. See Clara E. Laughlin, *Reminiscences of J. W. Riley* (1916).

**RILKE, RAINER MARIA** (1875– ), German poet, was born at Prague Dec. 4 1875. From 1900–10 he, together with Stefan George, held the field in lyric poetry. In his autobiographically-coloured *Aufzeichnungen des Malte Laurids Brigge* (1910) Rilke declares: "Verses are not sensations, as people think—they are experiences. For the sake of a single verse one must see many towns, men and things, one must know the animals, one must feel how the birds fly and in what way the little flowers open in the morning." His works include: *Buch der Bilder* (1902); *Stundenbuch* (1906); *Neue Gedichte* (1907–8); *Sonette an Orpheus* (1923).

**RINGWORM:** see SKIN DISEASES.

**RIO DE JANEIRO** (see 23.353).—According to the census of 1920, the population of the independent municipal commune, or Federal district, which contains the city and is detached from the province of the same name, was 1,157,873; an increase of 43% since 1906. In 1920 there were 1,265 factories, with 46,953 operatives, representing a capital of nearly 270,000,000 paper milreis and an annual production valued at 5,000,000,000 milreis.

The Federal district is governed by a prefect appointed by the president of the republic, and elects three senators and 10 deputies to the national Congress. The legislative power of the municipality is vested in a council of 24 *intendentes* elected for three years. The consolidated debt of the municipality in 1920 was computed at 227,089,200 paper milreis, of which 129,225,450 milreis was an external debt, and 97,863,750 milreis internal. The revenue had grown from 29,070,883 paper milreis in 1910 to 51,182,357 paper milreis in 1919.

*Education.*—Primary instruction is provided by the municipality, which in 1920 maintained 320 day schools and 68 night schools, with a matriculation of 74,111 pupils in the former and 8,662 in the latter. There were in addition 236 elementary private schools, with 19,825 pupils; over 80 receive a subvention from the Govt. if they adopt the official curriculum and admit a certain number of children free. Secondary instruction is cared for in public *lycées* and private establishments. There is no university, but the capital possesses higher faculties of law, medicine and engineering, besides schools providing instruction in pharmacy, dentistry, commerce, music, drama and fine arts. The national Govt. also maintains a naval academy, a military college and a preparatory school of tactics. The most important libraries are: the National Library, the best appointed in South America, the Municipal, the Gabinete Portuguez da Leitura, that of the Lycée of Arts and Crafts and the collections existing in the ministries and departments.

*Streets and Buildings.*—During the period 1910–26 the ambitious programme of municipal improvements inaugurated in 1903 was in large measure completed. The port works, including a sea wall over 2 m. long, 8 ft. above mean high tide and lying almost entirely in deep water, enclose a broad reach of reclaimed land and provide the city with the most modern facilities for loading and unloading ships. The Avenida Rio Branco (formerly Avenida Central) is one of the handsomest thoroughfares in the Western Hemisphere. Over a mile long from north to south, it is lined with fine private and public buildings. The military, naval and jockey clubs are situated there, and also the offices of some of the principal newspapers, such as the *Jornal do Commercio* and *O Paiz*, besides fashionable shops, cafés and business places. At the southern end is a group of elegant state edifices: the Municipal Theatre, the Monroe Palace and the National Library and Academy of Fine Arts. The Municipal Theatre, designed in 1904, cost over £2,000,000, although it seats but 1,700 people. The building which houses the National Library, opened in 1910 in commemoration of the centenary of its founding (1808), is also a notable addition to the city. It is a fireproof structure of granite, marble and steel, equipped with every modern library appliance.

One of the important developments of Rio de Janeiro has been in suburban road building. As the hills come practically to the

bay and sea, construction is difficult, but great progress has been made and a 40 m. motor drive over perfect roads joins all the famous beaches with Tijuca and the city. The magnificent bedside drive, the Avenida Beira-Mar, with double motor track and intervening lawns and gardens is particularly remarkable.

**Sanitation.**—The city, formerly a hotbed of yellow fever and smallpox, has become one of the healthiest tropical cities in the world. The death-rate has fallen to about 20 per 1,000. This is the result of a campaign of scrupulous cleanliness, rigid enforcement of sanitary measures and scientific eradication of mosquitoes and other germ-bearing insects, inaugurated under the direction of the celebrated Brazilian scientist, Dr. Oswaldo Cruz, in the first administration of President Rodrigues Alves (1903). In 1920 a law was passed by Congress creating a national Department of Public Health, consisting of three divisions, one in charge of the Federal capital (C. H. H.).

**RIO DE ORO** (see 23.357).—By Franco-Spanish agreements of 1904 and 1912 the Spanish zone in the Sahara—which is bounded east and south by French territory—was extended first from Cape Bojador (the northern limit of the Rio de Oro colony) to Cape Juby, and secondly from Cape Juby to the Wad Draa, the inland frontier being fixed at 8°40' West. The 1912 agreement settled a matter long in dispute by fixing the southern frontier of Morocco, which had claimed the Cape Juby district, at the Wad Draa. By the agreement in question Spain bound herself not to cede or alienate in any form her rights in her zone of influence. The value of the Spanish Sahara is, however, slight. The greater part of its area, about 102,000 sq. m., is desert; its inhabitants, nomad Arabs or Arabised Berbers, do not exceed 100,000, of whom four-fifths live in the northern half. Here, in the basin of the Saqiyet el Hamra, a river reaching the Atlantic midway between Capes Juby and Bojador, are fertile regions which might repay cultivation, including the oasis of Smara, where is a permanent native settlement and a Kasbah (stone fort). The Spanish headquarters are at Villa Cisneros, on the peninsula forming the Rio de Oro inlet. It has about 500 European inhabitants. In 1916 a small Spanish force was stationed at Cape Juby. The chief advantage Spain derives from possession of the country is its convenience to the Canary Islands fishermen as a curing station and fish dépôt. The waters between the Canary Islands and Rio de Oro abound with fish, but the industry is little developed.

See *Spanish Sahara* (1920); British Foreign Office handbook No. 124; also the *Revista* and the *Boletín* of the Royal Geographical Society of Madrid.

**RITCHIE, ANNE ISABELLA**, Lady (1837–1919), British writer (see 26.716), died at Freshwater, Isle of Wight, Feb. 26 1919.

**RIVER AND CANAL ENGINEERING** (see CANAL, 5.168; RIVER ENGINEERING, 23.374; WEIR, 28.496).—The most important event of the period under review (1910–26) was the opening of the Panama Canal to traffic in Aug. 1914 (see 20.666; also PANAMA CANAL).

There has been, since 1911, considerable development of canal and river navigation in France, Belgium, Holland, Sweden, central Europe, Canada and the United States of America, but very little in Great Britain, where the physical, industrial and economic conditions of the country provide little scope for such progress. On the other hand, many tidal rivers in the United Kingdom which afford access channels to important seaports have been improved by deepening and otherwise to keep pace with the development of trade and increases in dimensions of shipping. Similar changes have taken place in many river ports in foreign countries (see PORT ENGINEERING). Dredging craft of all descriptions have been improved to meet requirements, and at least one bucket dredger has been built capable of dredging material from a depth of 76 ft. below water level as well as suction dredgers of slightly less capacity as regards depth.

### I. IN THE OLD WORLD

**Great Britain.**—The navigation of the Trent between Newark and Nottingham has been improved by the construction of four new locks on this section. Begun in 1921, these will enable 120-ton barges to navigate at all seasons of the year as far as Nottingham.

The Anderton lift, which connects the Weaver navigation with the Trent and Mersey canal, is worked by electrical power, each of the two caissons being counter-balanced by weights. The Manchester Ship Canal (see 17.550) was in 1925 deepened from 28 ft. to 30 ft. from the entrance locks at Eastham to Ellesmere Port, a distance of about four miles. A petroleum dock has been constructed at Stanlow on the canal, near Ellesmere, and large extensions of quays, warehouses and other traffic facilities have been made both at Manchester and at Trafford Park below the city.

**France.**—Two important canals were in course of construction in France when the World War commenced, the Marseilles-Rhone Ship Canal and the Canal du Nord. The total length of the former is about 48 m. and it extends from the port of Marseilles to Arles on the Rhone, passing through the mountainous district of Nerthe by a tunnel at Rove, thence through the lagoon of Berre to Port-de-Bouc. The canal is level throughout, but there are two regulating locks and one at Arles between the river and the canal. These are 525 ft. long and 52 ft. wide. The waterway, normally 75 ft. wide at bottom, is 9 ft. 10 in. deep. The Rove tunnel, nearly 4½ m. in length, cut through rock, has a width of 72 ft. and a height of 47 ft. above water-level.

The Canal du Nord, begun in 1907, connects the Sensée Canal at Arleux and the Oise Canal at Noyon, and is 58 m. long. It is noteworthy on account of its considerable rise and fall, crossing two watersheds, its 19 locks, some of which have a rise of 21 ft. 6 in., and two long tunnels. The water supply is obtained by pumping, by means of electricity, from reach to reach the 3 waters of the Sensée, the Somme and the Oise. The maximum bottom width is 33 ft., the depth 8 ft. 2 inches. It is the best example of the standard type of 300-ton barge canal in France. The locks, 360 ft. by 20 ft., are provided with cylindrical sluices and single-leaf gates, all worked electrically. The works, which were wrecked in the course of the War, have been completed. Several tidal rivers of France have been improved at considerable expense by dredging, straightening and regulation, notably the Loire from the port of Nantes to the sea, the Seine below Rouen, and the Gironde below Bordeaux.

**Belgium.**—The completion in 1921 of the works, which had been carried on spasmodically for over 30 years, of the Belgian Canal du Centre provided a waterway for through traffic between the basins of the Meuse and the Schelde in southern Belgium. The last item of these works, the construction of three out of four barge lifts on the canal, was in hand before the World War and was resumed after the peace. These lifts consist of two steel tanks placed side by side, each measuring 141 ft. by 19 ft., carried upon and lifted by hydraulic rams. The rise of the first lift, constructed on this canal at La Louvière in 1888, is 50 ft. 6 in., while the three later lifts have a rise of 53 ft. 7 in. in every case. They are the only lifts constructed on any inland waterway since 1899, when the Henrichenburg lift on the Dortmund-Ems canal was opened. The Roupel Ship Canal, between a tributary of the Schelde of that name and Brussels, where an inland harbour has been built, was on the eve of completion, after 10 years spent on construction, when War broke out in 1914 and was not finally opened for traffic until 1922. This waterway, about 20 m. long, has a minimum bottom width of 66 ft. and a depth of 21 ft. The three locks are 374 ft. by 52 ft. 6 in. internally. The enlargement of another important ship canal, the Ghent-Terneuzen Canal was completed in 1911. The waterway, 18 m. long, about half of which is in Belgium and the other half in Dutch territory, was practically reconstructed. The canal now has a depth of 28 ft., and large ships can navigate up to Ghent, where an extensive inland port has been constructed.

**Holland.**—Important inland canal and river engineering works carried out in Holland since 1910 are the improvement of the rivers Waal and Yssel, both branches of the lower Rhine, the construction of the Wilhelmina Barge Canal and its branches, totalling about 50 m., and of the Meuse-Waal Canal. Most important of all has been the deepening and straightening of the waterway, mainly an artificial channel, between Rotterdam and the sea at the Hook of Holland to over 30 ft. at L.W.O.S.T. The enlargement of the North Sea-Amsterdam Ship Canal and the construction of a new entrance lock, which will be one of the largest in the world, and approaches at Ymuiden, were commenced in 1922.

**Central Europe.**—The construction of the Rhine-Meuse-Danube waterway, which will link up the North Sea with the Black Sea, was commenced in 1921, and a portion of the waterway was opened to through traffic as far as Aschaffenburg in 1924. It was expected that through traffic on a limited scale to the Black Sea would be established in 1926, but the completion of the works for the transit of ships of 1,500 tons d.w. capacity is not expected before 1932. The enlargement of the inland navigation harbour of Berlin, which now provides accommodation for barges and sea-going vessels of up to 600 tons capacity was completed in 1923.

**Sweden.**—The Trollhättan Ship Canal, connecting Lake Vänern in southern Sweden and the Kattegat, completed in 1916, is remarkable for a flight of three contiguous locks, overcoming a rise of 77 feet. The canal is 52 m. long, and the locks are 321 ft. by 45 ft., with a depth of 18 feet. The Hammarby Ship Canal, connecting Stockholm with Lake Mälaren, is now being constructed, and the Södertälje Ship Canal has been enlarged (1924) to take ships of 8,000 tons cargo capacity.

## II. IN THE NEW WORLD

The total length of improved navigable rivers in the United States is now upwards of 23,000 miles. At least 40 distinct and separate rivers have been improved by canalisation.<sup>1</sup> Since 1900 an immense amount of improvement of the inland waterways both natural and artificial of the States has been accomplished. As a rule, canalisation is well inland, the lower and middle reaches of the great rivers being open navigations. For instance, on the Hudson, the first lock is at Troy, 153 m. from the sea; on the Mississippi, at Keokuk, 1,461 m.; on the Tennessee, 1,339 m.; and on the Missouri there is open navigation to Fort Benton, Montana, 3,555 m. from the Gulf of Mexico. Only in recent years have locked waterways been constructed near seaports connecting ocean traffic with inland navigations. The New Orleans Industrial Canal and the Lake Washington Canal at Seattle are examples. Apart from improvements effected by the Federal Govt. several of the states have also undertaken canal work, notably New York, in the reconstruction of the New York State Barge Canal.

When traffic on American rivers commenced to become intense, recourse was had to extensive canalisation in cases where shallow water and limited flow gave rise to difficulties, either seasonal or continuous. Among the rivers so improved are the Ohio, with its tributaries the Allegheny and Monongahela; the Kanawha, West Virginia; the Kentucky in Kentucky; the Cumberland in Kentucky and Tennessee; and Tennessee in Kentucky, Tennessee in Alabama; the Black Warrior and Tombigbee in Alabama; the Columbia river in Oregon and Washington, and the Mississippi above Keokuk.

The locks on the Ohio are among the largest on the great rivers of the United States. When the improvements, commenced in 1910, on this river are completed there will be, in a length of 968 m. of canalised river, 50 locks, each 600 ft. by 110 ft. internally, with depths over sills ranging from 9 ft. to 12 feet. The lift of the majority of the locks varies from 6 ft. to 12 ft., but one, completed in 1921, has a lift of 29 feet. The cost of this improvement scheme, including dams, one of which is constructed at every lock, and dredging, is over £20,000,000. Eight locks included in the project are still under construction (1925). All are expected to be completed by 1929.

The Keokuk lock, the lowest on the Mississippi, was completed in 1913. In this case the dam was constructed primarily as a part of a hydroelectric power project. The lock, 380 ft. by 110 ft. internally, with 7 ft. over the sills, has a considerable lift—41 feet. The upper gate is of floating caisson type and is operated by compressed air.

*The New York State Barge Canal.*—Commenced in 1905 and completed in 1918 at a cost, including terminals, of upwards of £23,000,000, this is a reconstruction of the old Erie Canal and connects the Hudson river at Troy with Lake Erie at Buffalo. Altogether, including branch canals and the Lake Champlain section, there are 525 m. of canal proper, with 57 locks. Ships and barges up to 300 ft. in length and 44 ft. 6 in. beam can navigate the canal. Some of the barges using it have a cargo capacity of 3,000 tons. All the locks have a depth of 12 ft. over sills, and the maximum lift in any one is 40 ft. 6 inches. All lock and other machinery is operated electrically and the canal and its terminal ports are equipped in lavish manner with mechanical appliances. At Oswego, on this canal, is a novel and interesting system of syphons for emptying and filling the lock chamber. So far the traffic on the canal has not justified the expenditure on its construction.

*The New Orleans Industrial Canal.*—This connects the Mississippi river with Lake Ponchartrain six miles distant. Completed in 1923, at a cost of over £5,000,000, forms an important link of an entirely artificial waterway between the Mississippi at New Orleans and the sea, but in the main its construction was brought about by the desire to provide increased waterside frontage at the port of New Orleans. The lock at the

entrance to the canal is constructed on a foundation of 24,000 piles driven through a bed of very fine quicksand. The usable dimensions of the lock are 640 ft. length, 75 ft. width, with 31 ft. depth over sills. The Lake Washington Ship Canal, eight miles long, extending from Puget sound to Lake Washington, was completed in 1916. The sea entrance at Seattle has a large double lock and a smaller one. The large lock has a usable length of 760 ft. and is 80 ft. wide with 36 ft. depth over the sill. Flood water is provided for by the construction of a dam with movable crest gates.

The Cape Cod Canal, connecting Cape Cod Bay on the east side, with Buzzards Bay in the west of the Cape Cod isthmus, is 7½ m. in length. Its construction was commenced in 1909 and the waterway first opened to traffic in 1914, since when the works have been completed to give a depth of 25 ft. at low water. There are at present no locks on the canal, and on account of the difference in sea levels at the two ends there is at times a considerable current flowing through it.

The Sault Ste. Marie locks are situated in the St. Mary's river, which connects lakes Superior and Erie. Two new locks, completed in 1914 and 1919, were built to accommodate the largest ships using the Great Lakes. The length between gates of each of them is 1,350 ft. and the clear width 80 feet. Both have a depth of 24 ft. 6 in. over sills and a maximum lift of 21 feet.

*Locks and Dams.*—Since 1910, practically all locks on inland waterways in the United States have been constructed of concrete. No mechanical lifts or inclined planes are in use, and no provision is made at any of the locks for mechanical haulage of vessels through them. Electric locomotives for rack traction are, however, employed for towing ships through the locks of the Panama Canal. The large majority of the navigable waterways of the states, being rivers of very variable flow, the provision of dams or weirs with sluices has usually been necessary in conjunction with lock construction, and many of these works are of considerable magnitude. Steel lock gates of the double leaf mitred type are now adopted generally for new works, but rolling caisson gates are also used for closing many of the river locks, particularly at the upper and shallow ends of wide locks on rivers. "Tumbling" or flap gates ("bear trap"), hinged on a horizontal axis, have also been used in a few instances. Sluice valves are constructed in the lock walls and are frequently of the "butterfly" type, but Stoney gate sluices and cylindrical valves predominate. The practice of placing sluice valves in the gates has been abandoned. Movable dams of the Chanoine and needle types were formerly much used, but in the dams and weirs of recent construction some form of sliding or hinged sector gates has usually been adopted. The Stoney sluice is typical of the first class and the Taintor gate of the second.

*Canada.*—The new Welland Ship Canal, connecting lakes Erie and Ontario will, when completed, form the third connecting link between these lakes and will afford facilities for shipping on a far larger scale than the existing Welland Canal, which was reconstructed in 1872 and is 26½ m. long with 25 locks, 270 ft. by 45 ft., and 14 ft. deep on the sills. The new waterway was commenced by the Govt. in 1913 and is not expected to be completed before 1927. The total cost will be upwards of £21,000,000. It will have seven locks, each 800 ft. by 80 ft. internally, with a depth of 30 ft. over sills. Each lock has a rise of 46 ft. 6 inches. In addition, there are regulating locks at either end of the canal. The canal itself is being excavated to 25 ft. depth with provision for a depth of 30 ft. later. An ambitious scheme for a navigable waterway 25 ft. deep between the St. Lawrence river at Montreal and Lake Ontario, combined with hydroelectric development, has been considered by the Governments of the United States and Canada, but no decision to proceed with the work has been arrived at.

*Delta Outlets.*—The Southwest Pass at the sea outlet of the Mississippi<sup>2</sup> was selected in the project of 1902 for obtaining a depth of 35 ft. across the bar. Converging jetties, about 5,600 ft. apart at their land ends and 2,800 ft. apart at the bar, were substituted for the parallel jetties constructed at the South Pass, and dredging was relied upon to maintain the channel between

<sup>1</sup> Col. E. H. Schulz, U.S. Army, *International Congress of Navigation Proceedings* (1923).

<sup>2</sup> 11th edition, article RIVER ENGINEERING.

them. This dredging was found to be excessive, and in 1916 the project was modified by limiting the channel to a width of 2,400 ft. between the two parallel interior jetties. The depth is at present maintained at about 33 ft. or two ft. less than the projected depth, and although the work of maintenance presents many difficulties, the conditions have become more favourable since the contraction of the channel was effected. The artificial improvement of two mouths of a river is an unique experiment.

The forecast as to the necessity for the prolongation of the training jetties at the Sulina mouth of the Danube<sup>1</sup> has been realised. The cessation of dredging during the World War resulted in rapid decrease of the navigable depth which, combined with the continuous growth seaward of the deltaic deposit, so reduced the depth at and near the jetty ends as to compel resort, in 1924, to a subsidiary channel of limited depth on the north side of the entrance, which is now in use temporarily, while an extension of the jetties, 6,000 ft. seaward, and the dredging of the direct channel between them are being effected. Before 1914 the standard depth in the channel was 24 feet.

### III. MECHANICAL IMPROVEMENTS

Since 1910, the use of internal combustion motors as means of propulsion on canals has considerably increased. Even on the smaller canals many barges in all parts of the world are now self-propelled. Towing of barges both by steam and internal combustion motor tugs has also increased.

Mechanical haulage on canals has not developed in so marked a manner as towage. Electric tractors are still employed for barge haulage on the Teltow Canal (Germany) and the Charleroi Canal (Belgium) and petrol road tractors on the Bourgogne Canal (France). All these installations date from before 1910, but in every case the system employed has undergone modification and improvement since. On the Canal du Nord in France, between Saint-Omer and Janville, electric tractors running on rails on the bank haul 300-ton barges in groups of two or more. On the Calais-Saint-Omer section light caterpillar road tractors of the Citroën type were established in 1925 for hauling two or more loaded barges. Electric rail tractors are also employed on sections of the St. Quentin and other canals in the north of France. Mechanical traction by cable towing worked by electric capstans was installed in 1916 over a short length on the Marne-Rhin Canal, but the results obtained have not been entirely satisfactory. Other experiments in cable haulage have been abandoned after trial.

On the whole, the results of mechanical traction on canals do not show any marked decrease in cost compared with other haulage or towage, nor has the speed of the boats been materially increased. The cost of installing and working a system of electric rail traction is only justified in cases where, as on some of the canals in the north of France, the traffic is intense, and on the Nord system light tractors are preferred for the less busy sections. Electric capstans are provided at many French and a few Belgian and Dutch canal and river locks for facilitating the passage of barges through them. In some cases little use appears to be made of these facilities.

**RIVER PLATE:** see PLATA, RIO DE LA.

**RIVERS, WILLIAM HALSE RIVERS** (1864–1922), British psychopathologist, was educated at Tonbridge and St. Bartholomew's Hospital, London. He was made university lecturer at Cambridge in physiological and experimental psychology in Dec. 1897, and in 1907, when the two subjects were separated, lecturer in the physiology of the senses. He founded during this period the Cambridge school of experimental psychology, and

<sup>1</sup> 11th edition, article RIVER ENGINEERING.

was made fellow of St. John's College. In 1898, with his pupils C. S. Myers and William MacDougall, he joined the anthropological expedition to Torres Straits led by A. C. Haddon, and had charge of the psychological work. By the genealogical method of social investigation he obtained such valuable results that whereas he joined the expedition as a pure psychologist he returned a convinced ethnologist. *The Todas* (1906) records his investigation on these lines among the Todas in Southern India in 1902. His first expedition to Melanesia was in 1908. He revisited that area later, and in the *History of Melanesian Society* (2 vol., 1914) abandoned the evolutionary theory of society in favour of that of cultural migration. During the World War he obtained many valuable results as a psychopathologist, and while critically interested in Freudian methods of psychoanalysis he came to very different conclusions on matters of principle and practice. His later works include *Instinct and the Unconscious* (1920), *Psychology and Politics* (1923), *Medicine, Magic and Religion* (1924), *Social Organisation* (1924). He was elected president of the Royal Anthropological Institute in 1921 and was nominated a candidate in the Labour interest for the University of London. He died at Cambridge June 4 1922.

**RIVIÈRE, BRITON** (1840–1920), British painter (see 23.387), died in London April 20 1920.

**RIVINGTON, FRANCIS HANSARD** (1834–1913), British publisher (see 23.387), died July 2 1913.

**RIVOIRA, GIOVANNI TERESIO** (1849–1919), Italian archaeologist, was born at La Manta di Saluzzo in Piedmont Sept. 22 1849. He came of an old Piedmontese family and on his mother's side was descended from the Riccati (see 23.288), a family of mathematicians and architects. He trained as an architect and engineer at the University of Turin, entered Rome with the Italian army in 1870 and thenceforth resided there, devoting his life to travel and to the study of the architecture of the later Roman Empire. He published two monumental works, *Le Origini dell' Architettura Lombarda* (1901–7, Eng. tr. 1910), and *Architettura Musulmana* (1914, Eng. tr. 1918). At the time of his death in Rome, March 3 1919, he was engaged upon a third, *Architettura Romana*, which was posthumously published in Milan (1921) by his widow.

**RIZA PAHLAVI** (1877– ), Shah of Persia, was born in Savad Kuh, the son of an army officer. He joined the army in early youth and eventually rose to be one of the senior officers of the Cossack Division. In 1917 he went to Tehran from Hamadan with his regiment and compelled Col. Clergé, the then commander of the Cossack Division, to relinquish his command and replaced him by Col. Starosselsky. In 1921 with a force of about 4,000 men at his disposal he captured Tehran, and as a result became commander-in-chief of the Persian Army and Minister for War. In 1923 he took over the premiership and instituted a series of reforms, rendering assistance to the American Financial Mission which was already in the employ of the Persian Govt. for the purpose of modernising the various departments. In Oct. 1924 on the departure of the Shah, Sultan Ahmad Kadjar, Riza Khan Pahlavi was appointed by the Majlis to be head of a temporary Government until the form of a new constitution was drawn up. On Dec. 13 1925 Riza Khan Pahlavi was appointed Shah of Persia and the sovereignty was vested in the Pahlavi dynasty. The coronation took place in the Gulistan Palace in Tehran April 25 1926. He had married the daughter of Taimur Khan, an army officer of high rank under whom he had served earlier in his career. There was a son of this marriage, by name Mohamed Riza, who thus became vahlid or crown prince and henceforth known as Shahpur Mohamed Riza.

**ROAD CONSTRUCTION** (see 23.388).—The progressive transfer of traffic from railways to roads and the increase in the volume of road traffic and in the consequent strain upon the road surface impel the road engineer to seek more and more permanent and impervious materials which will avoid the vexatious process of frequent renewal.

Incidentally, an impervious surface will prevent the deterioration of the foundation and will enable the camber or crown

of the carriage way to be reduced, thereby adding to the safety and convenience of drivers. Cambers of 1 in 24,<sup>1</sup> and even steeper, used to be common. In modern practice this has been reduced to 1 in 48. In the design of new highways sufficient land is frequently acquired to enable all pipes, mains and conduits to be laid under the verges, shoulders or margins, so that the carriageway itself may not be subject to future disturbance. Dimensions of 100 ft. or 120 ft. between fences are becoming common in England, while in the United States even more generous figures are adopted.

**Width of Road.**—The wide road allows space for tree planting and keeps noise and vibration at a tolerable distance from the householder's windows. Spacious footways and verges on each side of a carriageway extend the motorist's view as he rounds a curve and promotes the safety of vehicles entering from side roads. Drivers gain a wider range of vision on each side and secure an extra fraction of a second for deliberation before venturing into the main stream of traffic.

Sharp bends and abrupt changes of direction are now discountenanced in favour of easy curves of long radius. Where, owing to the configuration of the ground, curves of less radius than 1,000 ft. are unavoidable the outer edge of the carriageway is super-elevated or "banked," following the invariable practice of railway engineers. The width of the carriageway should be increased at such points. Steep gradients which disfigure the rigidly straight Roman roads are avoided by moulding the line to the contours of the hillside. In laying out the new arterial roads in the neighbourhood of London, it has almost invariably been found possible to limit the gradients to 1 in 30. Gradients of excessive flatness (less than 1 in 300) are to be avoided, owing to the difficulty of effectively draining the surface.

**Single and Duplicate Carriageways.**—In designing new arterial roads, varying opinions prevail as to the relative advantages and disadvantages, on the one hand, of a single wide carriageway, or, on the other hand, of the duplicate carriageways for up and down traffic respectively. While the single carriageway 50 ft. wide will probably carry a greater volume of traffic in the year than two 30 ft. carriageways each reserved for one-way traffic, the separate tracks will conduce to the safety of the driver and to that of the pedestrian who, in crossing each carriageway, knows from which direction the traffic will be approaching him.

Again the duplicate carriageway lends itself to progressive development. In the first instance, while the country alongside the road remains open, a single carriageway can be formed and will meet travellers' needs until such time as population and traffic increase, when the second carriageway can be constructed without interfering with the road which is already in use. The general tendency of road practice to assimilate railway methods, encourages the view that separate carriageways (up and down lines) are likely to prevail in the case of new arterial roads.

In the older and more settled countries where a tolerably complete network of old highways already exists, the road engineer's task is usually confined to the improvement of these, rather than to the construction of entirely new communications. In Great Britain the creation of the Ministry of Transport in 1920 gave a marked impetus to the modernisation of the old highway system. The yield of the Government's Road Fund, derived from the taxation of mechanically propelled vehicles, rose from £11,500,000 in the calendar year 1922 to £17,250,000 in the year 1925, with the result that it became possible to launch in 1925 the so-called "trunk road programme" for the systematic transformation of the most important through routes of the country. In their unimproved state these usually possess a carriageway varying from 14 ft. to 24 ft. in width, with little, if any, footway. Generally speaking, where improvement is now undertaken, sufficient land is being acquired to allow a dimension of 60 ft. between fences. This affords space for a carriageway 30 ft. wide, two 8 ft. footways and two 7 ft. verges. In more rural areas the carriageway is limited for the present to 20 ft., only one footway is constructed, and the verges are widened to absorb the additional space. The work may be briefly sketched as follows:—

Adequate surface drainage, for want of which the older roads have usually suffered, is provided; fences are set back to 60 ft.; all sharp curves are smoothed out, and abrupt bends are eliminated where possible by forming a new length of road along the base of the

<sup>1</sup> The British refer to cambers in this way; in the United States they are referred to as  $\frac{1}{2}$  in. to 1 ft. or  $\frac{1}{4}$  in. to 1 foot. (Ed. E.B.)

triangle. In widening and regulating the existing carriageway the ground is excavated on each side, the existing haunches, where weak, are cut back and a foundation is formed of cement concrete from 6 in. to 9 in. in thickness, strengthened with metal reinforcement where requisite. This concrete serves not only as a foundation for the new road surface, but also as a lateral abutment for the arch of the carriageway. Where clay or loam underlies the road, a layer is formed of clinker or other similar material from 4 in. to 8 in. in thickness, to serve, after thorough consolidation, as a bed for the concrete. Both sides of the carriageway are kerbed with granite, or reinforced concrete, the latter presenting the advantages that unskilled local labour can be employed in its construction and that saving in transport is effected. The whole width of carriageway is finally covered with an asphaltic carpeting or other impervious material. On some of the steeper gradients, a stonefaced reinforced concrete track is laid alongside the carriageway so as to afford a satisfactory foothold for horses mounting the hill. Elsewhere the grass verges will be of service to horsemen.

### THE MAKING OF CITY STREETS

In the principal streets of the world's great cities where highly durable paving materials on a concrete foundation have long been in use—mastic asphalt, compressed asphalt, wood blocks, granite setts, etc.—recent changes of method are mainly confined to the strengthening of the concrete foundation by an increase in thickness or the introduction of metal reinforcement. In some areas in London it is now the practice to lay as a foundation for wood blocks a bed of cement-concrete as much as 12 in. thick, containing a steel reinforcing fabric. Intolerance of traffic interruptions encourages the introduction of time-saving devices, such as pneumatic drills for breaking up old concrete foundations; growing use is made in the busiest thoroughfares of quick-setting cements, such as *ciment fondu* and ferrocete, which reduce by a fortnight or more the period which must elapse before the road can be opened to traffic. Various experiments have been tried in the use of rubber as a paving material; in some instances it has taken the form of a wearing cap applied to a block of wood or other material; in other instances the entire block is composed of rubber. The elasticity of the material renders it somewhat liable to displacement under the stress of traffic and experiments are still being directed to the attainment of a secure anchorage.

**Foundations.**—The choice of materials for foundations is usually dictated by considerations of transport, though in certain favoured districts the hard, compact subsoil of chalk or rock needs but little improvement. On a firm stratum of chalk a well-compressed layer of clinker will often serve to carry the surfacing coat. Equally serviceable as a natural foundation is a well-drained bed of coarse gravel; finer gravels, and even so fine a material as sand, are not to be despised, provided that the latter has no opportunity of escaping laterally under pressure. In France a thick bed of river sand is not infrequently used as the foundation for sett paving. The bearing capacity of clay, loam and other similar subsoils is so diminished by the presence of water that great care must be taken to ensure adequate drainage before road-making operations are begun. The want of uniformity and reliability in the chance supplies of materials formerly used as "hardcore" foundation for new roads in areas devoid of quarries has led to a notable extension in the use of cement concrete as a road foundation. Hardcore derived from demolished buildings consists of ingredients possessing every degree of durability from broken fragments of plaster to the hardest vitrified bricks. These heterogeneous materials thrown down pell-mell in a layer 12 in. thick and subsequently crushed under a 10-ton steam roller form the foundation of most of the roads on outskirts of great cities, and it is not surprising that carriageways so constructed show obvious signs of weakness under the stress of modern traffic. The arguments in favour of concrete as a road foundation are somewhat less urgent in regions where supplies of rock are cheaply available in the vicinity of the road. In such cases the old method practised by Telford of forming a foundation with hand-pitched rubble continues to hold its own.

**Surfacing Methods.**—Water-bound macadam which still remains in use on lightly trafficked roads, does not possess impervious qualities and is therefore usually treated with hot surface

dressings such as tar or various bituminous mixtures, applied in warm, sunny weather to a thoroughly swept, dry carriageway, the surface of which is then "gritted" with chippings or shingle. As surface dressings, various asphaltic or bituminous emulsions are applied cold, regardless of weather. Tar is used as a surface dressing and as a "binder" for mixing with materials prior to their application so as to give cohesive qualities to the entire thickness of the road crust. By this means such materials as limestone and slag can be utilised, which are not so well adapted to waterbound methods.

Natural asphalts after a 60 years' test still remain in high favour for the paving of streets in wealthy cities. During the ten years, 1910-25, however, much research has been devoted to the problem of utilising the valuable properties of asphalts and bitumens in some cheaper form of pavement suitable for wider adoption. Asphaltic and bituminous mixtures are now utilised as a matrix to bind together an aggregate of broken stone or clinker, applied in one or two coats as a road-surfacing material.

In this category fall the processes known as bituminous macadam, grouted macadam, single-coat bituminous carpet, bituminous sand-carpet on a bituminous sand-crust, bituminous clinker carpet on a bituminous sub-crust. In many cases these surfacing materials are laid upon the old macadam road-crust suitably regulated, but where this does not afford sufficient strength a concrete foundation is formed. In all these bituminous surfacing methods, the need for securing the greatest possible compactness by the elimination of voids is achieved by elaborate precautions in grading the materials. It is necessary to determine experimentally the exact proportions of ingredients of varying grades needed to attain the highest degree of density in the resultant mixture.

As an example of the general lines followed by modern practice a few particulars may be quoted from a recent specification for one-coat bituminous clinker surfacing—a process which enables profitable use to be made of a waste product (clinker):—

The one-coat surfacing is to measure 2 in. in thickness after complete consolidation, and to have a crossfall or camber of 1 in 50. The mineral aggregate is to consist of well-burnt hard clinker, free from coke, ash or foreign matter. The bitumen has to comply with certain "penetration" and "solubility" tests. The concrete foundation, after thoroughly cleansing, is painted with a coat of hot bitumen. The clinker aggregate is to be mechanically broken to pass a  $\frac{1}{2}$ -in. mesh screen, and shall consist of approximately the following proportions of smaller grades:—

|                                                               | %                |
|---------------------------------------------------------------|------------------|
| Clinker evenly graded, $\frac{1}{2}$ in. to $\frac{1}{8}$ in. | 33               |
| Clinker passing 10-in. sieve                                  |                  |
| Clinker passing 20-in. sieve                                  |                  |
| Clinker passing 30-in. sieve                                  | 20               |
| Clinker passing 40-in. sieve                                  |                  |
| Clinker passing 50-in. sieve                                  |                  |
| Clinker passing 80-in. sieve                                  | 5                |
| Clinker passing 100-in. sieve                                 | 10               |
| Clinker passing 200-in. sieve                                 | 15               |
| Soluble bitumen as specified                                  | $\frac{17}{100}$ |
| Total                                                         | 100              |

The clinker is to be thoroughly dried and heated to a temperature of 300 to 350° Fahrenheit. It shall be mixed in a mechanical mixer with 17% of soluble bitumen.

After thoroughly mixing, the material is to be delivered on to the road at a temperature of 300 to 350° F. and spread with hot rakes to the specified thickness.

Rolling shall immediately follow with a light roller (6 to 7 tons), and as the temperature of the materials falls the rolling is to be continued with a 10- to 12-ton roller until no impression is made upon the road surface, which is subsequently to be dusted over with cement, or other approved filler so that a close compact surface may be formed.

Cement-concrete, after gaining a wide vogue in Canada and the United States, is now extending its sphere of use in Great Britain as a running surface for carriageways. Its use as a foundation for asphalt or wood blocks has long been an established practice. Special interest attaches to the application of concrete in view of the wide range of materials utilisable as aggregate, as compared with the very uneven geographical distribution of good road-stone supplies. On the other hand, concrete is somewhat handicapped by the lengthy period of setting and "curing," which is requisite before the new surface can be subjected to the strain of traffic. This unavoidable delay is of less

moment in the case of entirely new roads than in that of the reconstruction of existing highways, where acute inconvenience is caused to traffic by any lengthy period of closing. This difficulty may be mitigated in future by the use of quick-setting cements, several types of which (ciment fondu, ferrocrete and other aluminous cements) are now available.

**Standardisation.**—Standard specifications and practice have not yet been evolved for concrete road construction. There is considerable variety of method. The construction may take the form of one-course work or two-course work, the former consisting of one grade of concrete for the full thickness, while the latter provides two layers of concrete mixed in varying proportions. One-course work is simpler, and avoids the risk of cleavage between two layers of differing consistency. For two-course work a poorer concrete can be used for the lower layer. In America great lengths of new concrete highway are now being constructed across tracts of country hitherto unprovided with modern roads. The concrete measures 8 in. to 9 in. in thickness and 18 ft. to 21 ft. in width, with a scarcely perceptible camber.

**Methods of Laying.**—In the actual process of laying the concrete, there is much variety of practice, some engineers preferring to proceed continuously, while others adopt the "alternate bay" system, in which the carriageway is divided into slabs of uniform length, each extending the full width of the carriageway. The odd numbers would be laid first, separated by gaps representing the even numbers; these gaps would not be filled until the odd numbers had completely set, thus counteracting the effects of expansion and contraction. The transverse joints separating the slabs are sometimes disposed at right angles across the road; in other instances they lie at an angle of 60° or so to the kerb-line, so that the impact of the wheels of the vehicle does not strike any slab simultaneously.

The aggregate, consisting of crushed stone or gravel, should be clean and well graded in size, so as to reduce the percentage of voids to a minimum. Risks of failure in the concrete are greatly reduced by washing the aggregate. The sand must pass a rigorous test for cleanliness, and its particles should have the largest possible range of size from fine to coarse; if only one grade is obtainable, coarse is to be preferred. The proportions commonly adopted vary from 1 cement,  $1\frac{1}{2}$  sand and 3 gravel to 1 cement, 2 sand and 4 gravel. Only a bare sufficiency of water should be added—a very wet mixture encourages voids. Mechanical mixing plant is generally adopted and the use of mechanical tamping and finishing machines is greatly favoured in the United States, where they are found to play an invaluable part in minimising voids.

The precautions to be taken during the setting of the concrete depend largely on the climatic conditions. In moist weather no harm will arise from leaving the green concrete uncovered for a few hours, but in hot sunny weather exposure will lead to the formation of hair cracks. Heavy canvas is often used for protecting the concrete during the first 24 hours of setting. The canvas is then removed, and a layer of earth spread over the surface about 2 in. thick and left there for a fortnight or so. For the purpose of indurating the surface of the cement concrete, recourse is sometimes had to two or three applications of a weak solution of silicate of soda.

**Reinforcement.**—Where anxiety is felt as to the soundness of the subsoil on which concrete is laid, and it is accordingly desired to form a slab qualified to serve as a raft or bridge, one or two layers of metal reinforcement are often introduced into the concrete. In other cases reinforcement is adopted owing to the fact that the thickness of the concrete has had for various reasons to be reduced, and it is necessary to compensate for this reduction by conferring additional strength upon the concrete.

There are large numbers of fabrics in use, expanded metal of 6 in. and other meshes, woven wire, mesh fabrics in which the main tension wires of drawn mild steel run longitudinally with cross-wires welded thereto at regular intervals; other systems make use of twisted or vertical bars; double reinforcement is frequently used in "mattress" form, the upper and lower layers being connected by diagonal members. The weight of reinforcement varies in ordinary practice from 5 lb. to 25 lb. per yard superficial of concrete foundation.

**BIBLIOGRAPHY.**—Students should consult the proceedings of the Institute of Transport (London), the Surveyors' Institution (London) and the International Road Congresses held at Seville, 1923, and Milan, 1926, besides the technical journals dealing with civil engineering. (C. H. BR.)

**ROBERT-FLEURY, TONY** (1837-1911), French painter (see 23.403), died in Paris Dec. 8 1911.

**ROBERTS, FREDERICK SLEIGH ROBERTS, EARL** (1832-1914), British soldier (see 23.403). After 1905 Lord Roberts took a leading part, as head of the National Service League, in the movement in favour of compulsory military service for home defence. On the outbreak of the World War he was a frequent visitor at the War Office, and shortly after the arrival of the two Indian divisions in France he crossed the Channel to visit them in the trenches. He was attacked by pneumonia while at the front, and he died at St. Omer on Nov. 14 1914, the title going by special remainder to his elder daughter, Aileen Mary. He was buried in St. Paul's Cathedral, London.

**ROBERTSON, SIR GEORGE SCOTT** (1852-1916), British soldier and administrator, was born in London Oct. 22 1852. He was educated at Westminster Hospital medical school, and in 1878 entered the Indian Medical Service. He served through the Afghan War of 1879-80, and was for the next eight years civil surgeon in the United Provinces. In 1890-1 he travelled in Kafiristan (see 15.630). In 1893 he went as political agent to Chitral, and in 1895 was besieged there by hostile tribesmen (see 6.252). For his services he was created K.C.S.I., and appointed British agent in Gilgit. He retired from the Indian service in 1899 and returned to England. He was Liberal member for Central Bradford from 1906 until his death on Jan. 1 1916. He published *The Kafirs of the Hindu-Kush* (1896) and *Chitral: the Story of a Minor Siege* (1898).

**ROBERTSON, SIR WILLIAM ROBERT** (1860- ), British soldier, was born at Woburn, Lincs., Sept. 14 1860. He enlisted as a private in the 16th Lancers in 1877 and served in the ranks of that regiment until 1888, when he won a commission in the 3rd Dragoon Guards, then in India. He eagerly studied his profession in all its branches and he was very successful in learning the native languages. He was appointed railway staff officer in the Miranzai and Black Mountain operations of 1891, and in the following year joined the intelligence department at Simla; while on its staff he carried out a reconnaissance to the Pamirs, and in 1895 served with the Chitral Relief Force, being wounded and receiving the D.S.O. He passed through the Staff College in 1897-8—the first officer risen from the ranks to do so—and then, after a few months at the War Office, went out to South Africa on the Intelligence Staff; he accompanied Lord Roberts on his advance from Cape Colony into the Transvaal and was promoted brevet lieutenant-colonel for his services. He spent the period from 1901 to 1907 at the War Office, being promoted colonel in 1903, and he then went to the staff at Aldershot, where he spent three years. In 1910 he was appointed commandant of the Staff College, was shortly afterwards promoted major-general and in 1913 became director of military training at the War Office.

On the mobilisation of the army for the World War, Sir William Robertson—he had been given the K.C.V.O. in 1913—was nominated quartermaster-general of the Expeditionary Force; he filled that appointment most successfully for five months and then, in Jan. 1915, he became chief of the general staff to Sir John French. In the autumn of that year he was promoted lieutenant-general for distinguished service and in the following December was brought back to the War Office to take up the post of chief of the imperial general staff. There he immediately introduced great improvements in the office organisation. While convinced that the Western Front represented the decisive theatre of war, and fully aware how mischievous was dispersion of force in principle, he saw to it that, where operations in distant regions were unavoidable, the commanders on the spot were furnished with what was deemed essential to achieve success—with the result that the position of affairs in Mesopotamia, on the Suez frontier and in East Africa was completely

transformed within a very few months of his taking up his task. His services were recognised by his being promoted general in 1916 and by his being given the G.C.B. in 1917.

In the later months of 1917 he found it more and more difficult, in view of the somewhat disappointing results obtained by Allied offensives in France and Flanders, to persuade the War Cabinet that diversion of fighting resources to Alexandretta, or to Palestine, or to Macedonia, or to the Austro-Italian frontier, endangered prospects of victory at the decisive point and might lead to disaster near home. His anxieties were increased by the manner in which the problem of man-power was treated. He moreover foresaw that the Supreme War Council, introduced towards the end of the year, would not provide effective means for combining the operations of the Allies. In Feb. 1918 he was transferred by the Government to the charge of the eastern command in England—just one month before the success that attended the great German offensive of March proved how correct had been his appreciation of the situation. Three months later he succeeded Lord French as commander-in-chief in Great Britain. On the final distribution of honours for the War he was rewarded with a baronetcy and grant of £10,000, and he was nominated G.C.M.G. in 1919. From April 1919 to March 1920 he commanded the British troops on the Rhine, and, after relinquishing that appointment on the force being reduced, he was promoted field-marshal.

See his autobiographical volume *From Private to Field-marshal* (1921), and *My Story* (1922) (F. B. M.).

**ROBINSON, EDWIN ARLINGTON** (1869- ), American poet, was born at Head Tide, Me., Dec. 22 1869. From the public schools of Gardiner, Me., he proceeded in 1891 to Harvard, but withdrew after two years. From 1905 to 1910 he was connected with the New York Customs House, and then devoted his time to literature, especially to poetry. He became a member of the National Institute of Arts and Letters. In 1922 he was awarded the Pulitzer Prize of \$1,000 for his collected poems.

His works include *The Torrent and the Night Before* (1896); *The Children of the Night* (1897); *Captain Craig* (1902); *The Town Down the River* (1910); *Van Zorn* (1914), a play; *The Porcupine* (1915), a play; *The Man Against the Sky* (1916); *Merlin* (1917); *Lancelot* (1920); *The Three Taverns* (1920); *Avon's Harvest* (1921); *Collected Poems* (1921); *Roman Bartholow* (1922); *The Man Who Died Twice* (1924); *Dionysus in Doubt* (1925).

**ROBINSON, JAMES HARVEY** (1863- ), American historian; was born in Bloomington, Ill., June 29 1863. On graduating at Harvard University in 1887 he went to Germany, studying history at Freiburg University (Ph.D., 1890). In 1891 he was lecturer on European history at the University of Pennsylvania and in 1892 he was appointed associate professor of history at Columbia University, becoming professor in 1895. He resigned his professorship in 1919 and devoted himself to the organisation of the new school for social research in New York City. The "new history," of which he has been a leading exponent, challenges the traditional choice of material, maintaining that in the past far too much stress has been placed upon the course of politics and state rivalries, and too little on the rôle of thought in world changes. He was associate editor of *The American Historical Review* from 1911 to 1920.

Robinson wrote *The German Bundesrath* (1891); *Petrarch, the First Modern Scholar and Man of Letters* (1898); *An Introduction to the History of Western Europe* (1903); *Readings in European History*, 2 vol. (1904-6); with C. A. Beard, *The Development of Modern Europe*, 2 vol. (1907-8); with C. A. Beard, *Readings in Modern European History*, 2 vol. (1908-9); *The New History* (1911); *Medieval and Modern Times* (1915); *The Mind in the Making* (1921); *The Humanizing of Knowledge* (1923).

**ROBY, HENRY JOHN** (1830-1915), British scholar (see 23.424), died at Grasmere, Cumberland, Jan. 2 1915. He contributed a chapter on Roman Law to the second volume of *The Cambridge Mediaeval History* in 1913.

**ROCHEFORT, HENRI** (1830-1913), French politician (see 23.426), died at Aix-les-Bains June 30 1913.

**ROCHESTER, N.Y., U.S.A.** (see 23.430), increased 35.6% in population in the decade beginning 1910, reaching 295,750 in 1920, of whom 71,411 were foreign born and 1,579 negroes. The

state census of 1925 gave a population of 316,786. About 12 sq. m. were annexed at different times, making the area 32.1 square miles. Between 1910 and 1924 the assessed valuation of property increased 176% (to \$456,407,234); the net city debt, 229% (to \$42,153,545); the city's expenses, 249% (to \$15,370,660); post office receipts, 146% (to \$2,582,832); bank deposits, 114% (to \$312,985,838); miles of paved street, from 195 to 336; miles of sewers, from 275 to 422; number of pupils in the public schools, 104% (to 53,878). In the six years following the World War 33,820 building permits were issued, representing a value of \$105,410,101. There was a substantial development in its well-established and various industries. The value of the output of plant within the city limits was \$112,676,000 in 1909; \$351,416,000 in 1919; \$337,362,162 in 1923, when there were 964 establishments, employing 58,649 wage-earners.

A city planning bureau was created (1917), and zoning ordinances were adopted in 1919 and 1920. In the abandoned channel of the Erie canal a subway, crossing the entire city, was constructed, to provide tracks for interurban, passenger and freight service, and a belt-line connecting all the railways. The harbour and warehouses of the Barge canal (opened in 1918) are on the Genesee river, in the heart of the city. At the mouth of the river, on Lake Ontario, is the port of Rochester. The new medical school and hospital of the University of Rochester (made possible by gifts of \$4,000,000 from George Eastman, of Kodak fame, and \$5,000,000 from the General Education Board) was approaching completion in 1925; and the university had received gifts amounting to \$10,000,000 for expansion in other directions and general endowment. The Eastman School of Music, a department of the university, endowed by George Eastman, was opened in 1921; and the following year the Eastman Theatre, a gift by the same donor, was built and run under the management of the Eastman School of Music.

**ROCKEFELLER, JOHN DAVISON** (1839—); American capitalist (*see* 23,433), continued after 1910 to live a retired life and, for some years, to give great sums for charitable and educational purposes. In 1921 it was estimated that his bequests exceeded \$500,000,000, that he had drawn on his capital as well as his income and that he was no longer, as he had been, the richest man in the world. Be that as it may, he gave the bulk of his fortune to his son who has also made immense gifts.

His son, **JOHN DAVISON ROCKEFELLER, JR.**, was born at Cleveland, O., Jan. 29 1874. He was educated at Brown University (A.B., 1897) and, after engaging for a short time in business, withdrew and devoted his attention to philanthropic objects, continuing the charitable and other work of this nature initiated by the older man. He assisted, by endowments and otherwise, other educational and religious institutions, an instance of which was his financial support of the 1st Baptist Church, New York City, planned for Dr. H. E. Fosdick. Shortly after the War he gave \$1,000,000 for repairs to and reconstruction of the palaces at Versailles and Fontainebleau and the cathedral at Reims. In recognition of this he was in March 1926 made a citizen of Versailles by the city council. In 1926 was announced his offer to the Egyptian Govt. of \$10,000,000 for the purpose of establishing and endowing a museum of antiquities in Cairo, which was ultimately withdrawn, owing to the unwillingness of the Government to meet the conditions of the gift.

**ROCKEFELLER BENEFACTIONS.**—It was estimated that up to the end of 1924 Mr. J. D. Rockefeller had given for philanthropic and charitable purposes more than \$500,000,000—the largest group of charitable and educational gifts ever made. In this distribution he aimed at stimulating others to give in addition to securing the most effective utilisation of the bulk of his own fortune. Nearly four-fifths of his donations went to the four great benevolent corporations which he created: the Rockefeller Foundation, General Education Board, the Laura Spelman Rockefeller Memorial and the Rockefeller Institute for Medical Research. Quite as significant as the magnitude of these gifts was the fact that they were free from all restrictions, having been given outright for the purposes of the respec-

tive corporations, the trustees of which have power to dispose of the principal as well as the income. As the corporate purposes of these organisations are extremely broad, and the gifts free from restrictions, they will always be adaptable to the changing needs of future generations.

**General Purposes.**—The Rockefeller Foundation was chartered in 1913 under the laws of the State of New York (Congress having failed to enact the legislation necessary for a national charter) "to promote the well-being of mankind throughout the world." To this, the most extensive of his benefactions, Mr. Rockefeller had given in all nearly \$183,000,000 by 1925. The income and \$11,000,000 of the original gifts were expended from time to time by the trustees. With increasing definiteness the Rockefeller Foundation focused its efforts in the fields of medical education and public health. It supported by appropriations after 1913 the International Health Board, an independent organisation engaged, in co-operation with governmental agencies, in demonstrations for the eradication of hookworm disease in 14 southern states of the United States and 22 foreign states or countries; of yellow fever in five south and central American countries, and of malaria in 11 southern states of the United States. In addition, the International Health Board, with funds provided by the Rockefeller Foundation, organised in 1917, partly as a war measure, the Commission for Prevention of Tuberculosis in France. This commission conducted in limited areas, as demonstrations, vigorous campaigns of popular education in hygiene, and provided for the training of French women as health visitors. The continuation of the work was taken over by the French authorities after 1920.

**China Medical Board.**—The Rockefeller Foundation established in 1914 the China Medical Board to promote the development of scientific medicine and hygiene in China through medical schools, hospitals and training schools for nurses. The Peking Union Medical College, founded by this board, was opened in 1919, together with pre-medical and nurse-training schools, with the ultimate purpose of vesting control and maintenance of these institutions in the Chinese. The board has made gifts to other institutions in China which offer pre-medical courses, and to hospitals. The foundation gave, up to the end of 1924, \$15,793,745 to aid medical education in China. It established, in 1920, a Division of Medical Education, through whose advice large pledges of money were made for the development of medical centres in London and in various cities of Canada.

**Public Health Work.**—As a part of its public health work, the Rockefeller Foundation also made grants for the teaching of hygiene at Johns Hopkins University, Baltimore, and at the University of São Paulo, Brazil. A special feature of this work was provision for fellowships to persons from many lands engaged in study in medical education and in public health. The Rockefeller Foundation in 1923 co-operated with 32 states of the United States and 77 other states and countries in sanitation and medical education. During 1924, 864 individuals from 33 countries, including the United States, received from the Foundation some form of fellowship stipend to support their training to safeguard public health. During the World War the Rockefeller Foundation contributed nearly \$22,500,000 to war work and war relief, including \$5,000,000 of its capital; and before the crystallisation of its general policy of limiting its work to medical education and public health, it made appropriations to other causes.

**Educational Work.**—To the General Education Board; the next largest of his benevolences, Mr. Rockefeller had given, up to Dec. 1924, \$129,197,960. Up to July 1923, the board had appropriated for "the promotion of education in the United States of America, without distinction of race, sex or creed." the sum of \$106,214,284. Most of this had been given toward endowments of colleges, excluding professional departments, the rule being to make gifts contingent upon the raising of additional sums by the beneficiaries. When colleges, in 1919, were losing valued teachers because their salaries could not meet the suddenly increased cost of living, Mr. Rockefeller made a

special gift to the General Education Board of \$50,000,000 to be used in helping the colleges raise enough funds to increase salaries. This averted a severe loss to education. Among medical schools which have received aid from the General Education Board are: Harvard School of Public Health, \$1,203,664; Johns Hopkins, \$6,232,000; University of Chicago, \$2,000,000 (joint fund with the Rockefeller Foundation, 1916); Vanderbilt, \$5,500,000 (1919); Rochester, \$5,000,000 (1920); Yale, \$1,768,000; Columbia University, \$2,000,000 (joint fund with the Rockefeller Foundation, 1920) and the Meharry Medical College (for negroes), Nashville, Tenn., \$150,000 (1920). Besides the \$50,000,000 mentioned, Mr. Rockefeller in 1919 gave \$20,000,000 to the General Education Board, both principal and interest to be spent in the United States.

The board that year gave \$500,000 toward the endowment of a Graduate School of Education at Harvard, opened the following year; and in 1920 appropriated \$1,000,000 to the building fund of Teachers College, Columbia University, the largest gift yet made to any institution for training teachers. To the Rockefeller Institute for Medical Research, New York, which seeks to eradicate diseases by discovering their origins, Mr. Rockefeller gave in all some \$40,000,000. He gave, up to the end of 1924, nearly \$74,000,000 to the Laura Spelman Rockefeller Memorial, New York, largely to continue charities for women and children in which Mrs. Rockefeller (*nee* Laura Spelman), who died in 1915, had been much interested. Besides these munificent gifts Mr. Rockefeller has given \$18,000,000 to Baptist and other churches and about \$45,000,000 for various purposes connected with the University of Chicago.

**J. D. Rockefeller, Jr.**—In his public gifts—\$48,000,000 up to 1925—Mr. J. D. Rockefeller, Jr., has carried forward the purpose of his father, to promote the well-being of mankind throughout the world. Notable among these gifts have been: to the Northern Baptist Convention, \$2,300,000; Bureau of Social Hygiene, \$2,000,000; Brown University, \$500,000; Inter-Church World Movement, \$1,500,000; International House, where hundreds of Columbia University students from many lands and all races live together in amity, \$2,360,000; New York Public Library, \$3,500,000; Cathedral of St. John the Divine, \$500,000; Young Men's Christian Association International Committee, \$1,500,000; Hampton Tuskegee Institute (for negroes), \$2,500,000; Metropolitan Museum of Art, \$2,000,000; toward restoration of gardens of Versailles and the Cathedral of Reims, \$1,000,000; toward restoration of the Imperial University of Tokyo, Japan, 4,000,000 yen (\$1,540,000); International Education Board, \$21,000,000, to advance scientific research and education and to promote agricultural science and practice throughout the world.

**RODIN, FRANÇOIS AUGUSTE** (1840-1917), French sculptor (see 23.447), died at Meudon, near Paris, Nov. 17 1917.

**ROERICH, NICOLAS CONSTANTINOVICH** (1874- ), Russian painter of Scandinavian origin, established his reputation by painting pictures of Russian prehistoric life and the wanderings of Vikings. After beginning with realistic pictures, his manner evolved under the influence of the Byzantine Icon and of Oriental art, towards a purely decorative and monumental style. Roerich studied the technique of ancient Russian frescoes and his wall paintings for the Kazan railway station at Moscow, representing combats between Russians and Tartars, are considered his most important work. He became a member of the "Artistic World" group, director of the school for encouraging art in St. Petersburg, a member of the Imperial Academy, and was also an archaeologist and a poet. He executed a number of works for the theatre: for the Russian ballet he painted the scenery in *Prince Igor*; for Stanislavsky the setting of *Peer Gynt*. He wrote the libretto for and also designed the scenery and the costumes of *The Rite of Spring*, for which Stravinsky composed the music. After the Russian revolution of 1917 he settled in America, and his art grew more and more abstract, tending towards occult mysticism. In 1924 he undertook a journey to India which provided him with much inspiration for his later work.

**ROLL, ALFRED PHILIPPE** (1846-1919), French painter (see 23.465), died in Paris Oct. 27 1919.

**ROLLAND, ROMAIN** (1866- ), French man of letters, was born at Clamecy, Nièvre, Jan. 29 1866. He was educated at Clamecy, and later in Paris, where he had a distinguished academic career. From 1889-91 he was a member of the French School in Rome, in 1892 went with an archaeological expedition to Italy, and in 1895 was appointed professor of the history of art at the École Normale Supérieure, later occupying the same position at the Sorbonne, where he introduced the study of the history of music. He produced many critical and historical works, among them *Les origines du théâtre lyrique moderne*, *Histoire de l'opéra en Europe avant Lulli et Scarlatti* (1895); *Des causes de la décadence de la peinture italienne* (1895); *Le théâtre du peuple* (1901); besides studies on Millet (1902); Beethoven (1903) and Michel-Ange (1906), *Les Tragédies de la foi*, *Saint Louis*, *Aërt*, *Le Triomphe de la raison* (1913). His most famous work, however, is the romance of *Jean-Christophe* (1904-12), the biography of a German musician. It is in three series, *Jean-Christophe*, *Jean-Christophe à Paris* and *La Fin du Voyage*, and appeared in 10 volumes, the first *L'aube*, in 1904, and the last *La nouvelle Journée*, in 1912.

When the World War broke out Rolland was in Switzerland, and although his open letter to Hauptmann expressed his horror of the burning of Louvain, he became extremely unpopular in France owing to a series of articles published in the *Journal de Genève* during Sept. and Oct. 1914, and especially by the article *Au-dessus de la mêlée*, in which he deplored these single combats, "Eucken contre Bergson, Hauptmann contre Maeterlinck, Rolland contre Hauptmann." This article later gave the title to a collection of essays of which the ninth edition appeared in 1915. He maintained his pacifist attitude throughout the War. Although his reputation in France suffered from his political views, it increased abroad, and the performances of *Danton* and *Le 14 juillet* (which with *Les Loups* make up his *Théâtre de la Révolution* (1909), caused a furore in Berlin. His work *Mahatma Gandhi* (1924) is an impassioned defence of the Indian leader. His later works include: *Colas Breugnot* (1918); *Les précurseurs* (1919); *Clerambault*, *Pierre et Luce* (1919); *Voyage musical aux pays du passé* (1919); *Liluli* (1919); *L'âme enchantée* (1922); *Annette et Sylvio* (1924); and *L'été* (1925).

See Jan Romein, *Romain Rolland* (1918); I. Debran, *M. R. Rolland, initiateur de défaitisme* (1918); W. Kuechler, *Romain Rolland* (1919).

**ROMAIN, JULES** (1885- ), French poet and novelist, was born Aug. 26 1885 at Saint-Julien-Chapteuil in the Ardèche. He went early to Paris and spent his childhood and adolescence in Montmartre. He entered the École Normale Supérieure in 1906, and graduated in philosophy in 1909. For 10 years he taught philosophy in Paris and in the provinces, notably at Nice. His claim to fame is principally based on his position as one of the heads of the Unanimist school of writers (Arcos, Vildrac, Duhamel, Chennevière and others). This school conceives of crowds, especially those of modern cities, as possessing an unconscious solidarity by virtue of the communal lines of thought and sympathies that bind them—the equivalent of a socialist Christianity without altars and without militant ideas, and is sometimes known as the group of *l'Abbaye*, after the place of retreat that certain of them chose with the object of working and creating communally. Romain's novels and verse and certain of his plays, *Cromedeyre-le-Vieil* (1920) and *Le bourg régénéré* (1920), exemplify this doctrine. His later plays, *M. le Trouhadec saisi par la débauche* (1922), *Knock* (1925), have a Molièresque humour which made them popular in France.

**ROMAN CATHOLIC CHURCH** (see 23.486).—In reviewing the history of the Catholic Church from 1910 to 1926, it will be seen that its activities range over a wide field of religious and philanthropic interests. These include the maintenance of its faith and discipline; the codification of its laws; the remodelling of its administration; the safeguarding of Catholic education; the training of its home and missionary ministry; the fostering of organisations of charity and piety; the adjustment of its relations

with the civil power; the promotion of Christian reunion; the expansion of its mission work; and the teaching of sound principles from the Christian standpoint as the essential means of securing peace and equity between the nations, and between the classes within the nations.

### I. THE CHURCH IN THE OLD WORLD

*Modernism.*—The three years preceding the War (1911-4) saw the completion and execution of the decrees for the defence of the Faith against modernism. The decisions given, and the measures adopted by the Holy See in 1907, made it clear that the modernist teaching of that time could have no recognition or standing-room inside the pale of the Catholic Church. Its three great leaders had been the Abbé Loisy in France, Don R. Murri in Italy and Father Tyrrell in England. The first two were excommunicated. The third died under censure and was not buried with Catholic ritual. The disciplinary regulations enacted by Pius X. were supported by the episcopate throughout the world, and were maintained by his successors Benedict XV. and Pius XI.

*The Church and the War.*—Britain declared war on Aug. 4 1914, and 16 days later, Pius X. died—broken hearted, it is said, at the failure of his efforts to prevent the outbreak of hostilities. His successor Benedict XV. was elected on Sept. 3 and lived until Jan. 22 1922, more than three years after the conclusion of the Armistice. His Pontificate thus broadly covered the whole period of the great world conflict. His attitude and action during that time, as shown by the documentary evidence, consisted in taking every means and every opportunity to bring about the restoration of peace. In Feb. 1915 he ordered special services to be held, and prayers to be offered throughout the whole Catholic world. He sent Encyclical Letters to the bishops and clergy in all countries to leave nothing undone to foster the spirit of peace-making and reconciliation. In Aug. 1917, he made a direct appeal to the belligerent powers, and even suggested terms on which they might find a rational settlement of their quarrel.

His conception of peace, and the conditions on which it might be brought about, were found to be too idealistic to have at that moment any chance of consideration. Catholics in all nations, according to the custom of the Church, were free in their prayers for peace to pray for the complete victory and triumph of the arms of their own and allied countries. On the other hand, the Pope, by his position as spiritual father of Catholics in all nations, was bound to maintain an attitude of neutrality in the sense of paternal impartiality. Hence in the mind of Benedict XV., the ideal of peace was one which was not to be attained by the crushing, or crippling, or humiliation of an adversary, or by any one-sided triumph over a fallen foe. As he expressed it in May 1915, the peace which was needed ought to be one "inspired by the spirit of equity and good-will, so that it might be an achievement of justice in harmony with the dignity of the nations." He was convinced that no other peace would be lasting, or free from the complications and animosities which would lead eventually to another war. This ideal of a peace, carefully consistent with the honour and comity of nations, was set forth in all his utterances throughout the War, until the logic of events brought about the Armistice, and with it a more drastic solution. In a public Consistorial Letter in the same month, he denounced "the methods of warfare on land and sea" which are "contrary to the principles of humanity and of international right." In the consistory of Jan. 1915, he had protested against the devastation made in the occupied territory, and the cruelty to the inhabitants, beyond the necessities of war—a rebuke to the invaders, for which he received the thanks of the Belgian Government.

While the efforts of the Church proved unavailing for the stopping of the War, they were directed with greater success to mitigate its evils, by promoting organisations for the care of the wounded, the tracing of missing soldiers, the relief of prisoners of war, their transfer for convalescence to Switzerland and notably for the collection of funds for the starving populations in Russia and in the Near Eastern countries.

Soon after the Armistice, in Dec. 1918, Benedict XV. addressed an Encyclical Letter to all bishops throughout the Catholic world, ordering services to be celebrated in all their churches to thank God for the cessation of hostilities, and to ask His blessing upon the deliberations of the Peace Conference that it might secure a lasting reconciliation between the Powers. On the part of the Holy See, he pledged himself to use "all the influence of his Apostolic ministry to see that the decisions of the Conference for the maintenance of order and tranquility amongst the nations should be gladly accepted and loyally carried out by all Catholics."

*The Church and Canon Law.*—The spring of the year 1917 marked the completion of a notable enterprise in the domain of the Church's jurisprudence. The laws of the Church had accumulated during the centuries and had to be sought in the *Corpus Juris Canonici*, or in the ponderous collections of Councils, or in the rescripts of the Roman pontiffs or in the decrees of the Roman Congregations and tribunals, which largely make up the case-law of the ecclesiastical courts. The great project of Pius X. at the inspiration of Mgr. (later on cardinal) Gasparri, was to transform this vast material from a Corpus into a Codex, in which the operative Canons of the Church would be collected, amended, re-arranged and while retaining their usual titles of classification, should appear in a consecutively numbered series and thus simplify the work of consultation and reference.

The execution of this colossal task—*Immensum paene opus*, as the Papal Constitution calls it—was entrusted to a Commission in which 29 Cardinals took part, aided by more than 40 Consultors, expert Canonists selected from Rome or various parts of the Church for their proficiency in Canon Law. The work occupied the Commission for 13 years, from March 1904, till May 1917. During that time, the proofs of the new Codex were sent no less than three times over to the entire Catholic episcopate in all parts of the world for suggestions, additions or amendments. As a result, the whole body of Church law has been compressed into a single volume and set forth in 2,414 canons. On the promulgation of the new Code to the world at Pentecost, 1917, Benedict XV. commemorated the event by having a special medal struck and a large tapestry, with portraits of the Commission, made to hang on the walls of the great Consistorial Hall of the Vatican.

*Apostolic Visitations.*—While the work of codification of the Canons was proceeding, Pius X. took measures to strengthen discipline and to secure their observance. A Visitation or Commission of Inquiry was held in many parts of Italy, to investigate the state of the dioceses, to remedy defects and to promote spiritual progress. In several cases where the incumbents, owing to age or inefficiency, were unequal to their post, they were removed or practically replaced by an Apostolic Visitor until the required changes were effected. Pius X. set the example for this disciplinary reform in his own diocese. As Rome is the capital of the Church, a considerable number of clerics and monks from all parts were usually attracted thither, and these included not only those who came for business or for study, but not a few that would have been more usefully employed elsewhere.

Pius X. issued strict orders to the Cardinal Vicar to see that no cleric or religious should be allowed to reside for any notable time in the city except for satisfactory reasons, and that in such cases they should be subject to the supervision of the ecclesiastical authorities. These regulations were rigidly carried out, and served to restore the more normal proportion of the clerical to the lay population, and to remove causes of complaint and dissatisfaction. At the same time, the Holy See sent letters to the bishops of Italy and of other countries, urging them to encourage missions for the people, and the formation of guilds for teaching Christian doctrine. It further exhorted them to interest their clergy in the social and economic well-being of the people, and to aid in the formation of parochial saving-banks to promote habits of thrift and industry.

*The Holy See and Italy.*—The attitude of the Holy See towards the civil power in Italy, while abating in nowise its claim to spiritual independence, and all that is required for it, has, owing

to the change of circumstances, during the years under review entered into a new ethos and outlook. The Vatican has followed its policy of neutrality to all political parties, and has refused to identify itself even with the Catholic *Partito Popolare* or with the pacific revolution which was effected by Signor Mussolini and his Fascisti. Nevertheless, under the Fascist régime, the relations between the Papacy and the kingdom of Italy have been more friendly than they have been at any time since the Italian occupation, and the Holy See has welcomed with gratitude the fuller recognition of religion by the civil authorities, and the restoration of religious teaching in the schools.

*The Church and France.*—For several years before the War, the Church in France was still emerging from the crisis caused in 1905 by the separation of Church and State. The difficulty lay in the collision between the traditional religion of the country and the political ideals inherited in part from the Revolution. Of a population of nearly 40,000,000, a majority may still be said to be traditionally or nominally Catholic. But only a minority make practical profession of their religion or use their political influence in deference of its interests. The bulk of the electorate, and with it, the voting power, and consequently the government of the day, belongs to those who, if not hostile, or indifferent, or respectfully neutral to religion, are averse in principle to any recognition of its place in matters of secular or national import. In the early years of this century, this movement made itself felt in the enactment of a series of laws in the direction of laïcisation or secularity. The separation of Church and State followed upon the suppression of the religious orders (save a few that obtained authorisation in view of their work in the East) and the disqualification of their members from holding any official post of teaching.

The abolition of the Concordat brought with it drastic disendowment. The provision substituted for the support of the Church, and known as the *Associations Culturelles*, under the chief control or supervision of civil functionaries, was rejected by the Holy See and the French bishops as infringing on religious liberty, so that nothing remained to the French Church but the permissive use of the cathedrals and parochial church buildings. Left wholly dependent upon the voluntary contributions of the people, the bishops have formed diocesan organisations of their own (*Associations Diocésaines*) and these, although labouring under many difficulties, are said to be fairly successful. It was recently pointed out by eminent French jurists, that it was possible, under the existing law of syndicates, to obtain State recognition for these associations. This plan has been carried into effect at Lyons and elsewhere, and, so far, promises to be a successful solution. On the whole, the condition of the Church in France is said to be stronger than it was under the Concordat, at least in the sense that what it has lost financially, it has gained in liberty. It is now free to found new parishes and build new churches wherever needed, without the hampering civil formalities of former times. In Paris alone, more than 30 new parish churches have been erected to meet the needs of the city and the suburbs. Most of all, the Church is left free to have its bishops chosen without interference of the civil power.

In the programme of laïcisation, one of the most acute problems is to be found in the schools. In those which are built and supported by the State, religion has no recognised place in their teaching. Catholics have sought to meet what they feel to be a conscientious need, by building schools for themselves. These free schools (*écoles libres*) fulfil a work of education, but receive no aid from the State, and have to depend upon the generosity of private benefactors. It has been proposed that the sum voted by the nation for the purposes of education should be equitably divided between all schools which teach efficiently, in proportion to the number of children taught or to the results attained. An Association formed to promote this scheme (*Représentation proportionnelle scolaire*) has an important following, but has not succeeded in obtaining an effective majority, and thus the Church in France in the important matter of religious teaching in the schools has not yet been able to secure the same advantages which are available in England, Holland, Germany and Italy.

*The Church in Germany.*—In Germany, the Church has had to deal, and, during this period in a more accentuated form, with the spread of socialistic, or communistic, principles amongst the industrial classes. Its policy has been to encourage Catholic workmen to unite together to promote their legitimate interests—notably on the lines indicated in the Labour Encyclical of Leo XIII.—and to protect themselves from the evils which would be wrought by unsound or unchristian theories. For this purpose large associations of workmen were formed in Eastern Germany under the patronage of Cardinal Kopp, Archbishop of Breslau, and in Western Germany, under that of Cardinal Fischer, Archbishop of Cologne. The aim of both was the same, but certain differences arose in the method of pursuing it. The former wished to confine membership of the Association to Catholics, while the latter deemed it expedient to secure, if need be, the admission or co-operation of non-Catholics.

Pius X. in his letter to Cardinal Fischer (Dec. 31 1910) congratulated him, as he had already congratulated Cardinal Kopp, on his great service done for the labouring population, and laid down regulations by which both systems might be worked efficiently. In a few years, the World War did much to suspend the action of these labour guilds, but in the new conditions after the conclusion of peace, the Church is again at work fostering union, and endeavouring to meet the penetration of subversive doctrines by the spread of sound economic and Christian principles. In Southern Germany, the Church has been helping in the reconstructive work of the new States, and the fragments of the late Austrian Empire.

*The Church in S.E. and E. Europe.*—The Holy See concluded a Concordat with Serbia and Poland, and also with Czechoslovakia, where a section of the clergy and people had seceded and formed themselves into a separate national church. Benedict XV., addressed an Encyclical to the Czech bishops urging the work of more frequent preaching and of retreats for the sanctification of the clergy, and received in return the assurance of thanks and loyalty from the Archbishop of Prague and the Church of Czechoslovakia. To meet the new post-War conditions, new archbishoprics have been founded at Danzig, at Riga in Poland and at Jasovin, Czechoslovakia. Since 1910, 23 archbishoprics and 47 bishoprics in other countries have been added to the Catholic Hierarchy.

*The Church in Spain.*—In Spain, the normal proportion of secular priests to the Catholic population has not been notably exceeded, but that of the clergy belonging to the religious orders has, at least, in times past, been considerably above it. In 1903, a Concordat with the Holy See limited the number of religious orders to a few authorised bodies, and to one additional order sanctioned by the Supreme Pontiff. In recent years, the Government and the Holy See have entered into fresh negotiations in which a reasonable restriction has been satisfactorily arranged. In the rural districts, under the guidance of the Church, much has been done to help and organise the agricultural classes in the National Catholic Agrarian Association, which has more than 5,000 local unions. Its activities take the form of establishing savings-banks, encouraging co-operation and adjusting disputes between the employers and the employed. Associations for women and for Catholic young men, have been successfully established.

*The Church in England.*—In England, a notable constructive change took place in the government of the Catholic Church in 1911, when the Holy See, which had raised it from the rank of a missionary country under the Propaganda to the normal status under the Consistorial, and divided its single province into three, Westminster, Liverpool and Birmingham, and in 1916, placed Wales under the new archbishopric of Cardiff. This widening of the organism has already borne fruit in multiform and increased activities.

*The Jubilee Year.*—One of the most memorable features in the recent life of the Church has been the celebration of the Holy Year or great jubilee of 1925, which drew to Rome more than 1,250,000 pilgrims. These pilgrimages came from all lands—even from Iceland and Australia and Chile—and have served the

vital purpose of a popular circulation to the centre from all parts of the circumference. They have shown the notable increase in the international character of Catholic Associations, including workmen, women, university students and many other categories. Not the least remarkable was the assembly in the Piazza of St. Peters of 12,000 Catholic Boy Scouts, of whom nearly 1,000 had come from Great Britain. Pius XI. congratulated them on their international organisation, and on their imitating, in this, the Catholic Church, which itself is essentially international. The Missionary Exhibition held at the same time at the Vatican was an object lesson of notable progress in the far-flung line of operations in the Mission field. It may be said that the jubilee year has drawn the whole Catholic world more closely together in the personal contact of bishops, clergy and people of all classes with the Holy See.

Gwynn, *The Catholic Reaction in France* (1924); see also *The Catholic Directory*; *The Catholic Who's Who and Year Book*. (J. Mo.)\*

## II. THE CHURCH IN THE UNITED STATES

There is hardly any parallel in the history of Catholicism to the rapid growth of the Church in the United States during the 100 years from the death of Archbishop Maréchal (1828) to the present. This growth has given rise to serious discussion among Catholic writers. Some hold the increase from 25,000 in 1785 to about 25,000,000 at present to warrant the stand that there has been no leakage; others, basing their study upon the same figures (immigration, statistics, census reports, etc.) hold that there has been a considerable loss (*cf.* Canevin, *An historical and statistical Examination into the Progress and Population of the Catholic Church in the United States from 1780 to 1920*). The growth of the Catholic Church in the United States is due primarily to immigration, natural increase and conversions. The statistics generally accepted by Catholic writers, based upon the estimates made by John Gilmary Shea in 1891, are as follows:—

|      |            |
|------|------------|
| 1790 | 40,000     |
| 1820 | 243,000    |
| 1830 | 337,620    |
| 1840 | 661,254    |
| 1850 | 1,767,841  |
| 1860 | 3,392,980  |
| 1870 | 4,901,980  |
| 1880 | 7,026,820  |
| 1890 | 10,419,668 |
| 1900 | 13,537,697 |
| 1910 | 18,483,320 |
| 1920 | 22,733,254 |

This computation would apparently support the statement that there were in the neighbourhood of 25,000,000 Catholics in the United States in 1925. That these figures do not represent what should be the actual total of Catholics is claimed by some writers. In Canevin's careful study of the question, we read:—

Among the principal causes of loss to the Church in the United States, particularly during the first half of the 19th century, we may mention: the inadequate supply of priests and churches; the want of Catholic schools; the scandals and schisms arising from trusteeism; mixed marriages; intemperance and the degraded poverty of which it was the cause; social exclusion and sometimes the social and political persecution of Catholics; and the proselytism of orphans and of men and women of weak faith.

**Racial Composition.**—Racially, the Church in the United States is made up of groups from every nation in the world, with the English-speaking peoples in the majority. Up to the middle of the 19th century, the Irish and the Germans furnished the greater quota of its adherents. Later the French-Canadians, Italians, Mexicans, Poles, Lithuanians, Slovaks, Hungarians and others added notably to the number. There is also an appreciable percentage of Oriental Catholics—Greeks (Uniates), Syrians, Armenians, etc.

**External Relations.**—This almost unprecedented growth of a religious organisation which had been subject to legal and political disabilities since the 16th century was bound to give rise to misunderstandings in a country so largely composed of

Protestants. During the 19th century several organised politico-religious movements were instituted for the purpose of hindering the exercise of the franchise on the part of American Catholic citizens. Chief among these were the Native-American party, the Know-Nothings, the American Protective Assn. and recently the Ku Klux Klan. Being under the protection of the Constitution, and enjoying the advantages of the common law, Catholicism has not met with any official opposition. Such outbursts of political or religious anti-Catholicism as there have been were but temporary or local, and did not represent the more general attitude of American citizens. These anti-Catholic movements never became national in scope but remained mostly sectional and were due to a condition in which political, social and industrial elements were closely intermingled. The political theory of an inherent antagonism between Catholicism and Americanism has given rise to many interesting studies upon the question, chief of which from the Catholic side is the *Catholic Builders of the Nation* (5 vol., Boston, 1923). Many writers on this alleged incompatibility between Catholicism and republican institutions fail to give due allowance to the economic adjustments involved in these sectional antagonisms to the Church.

**Internal Development.**—The internal development of the Church in the United States has been of a uniform nature. Its doctrinal history offers little of importance. The Church discipline in vogue is similar to that of the other churches of Catholicism. Unity of doctrine, of moral law and of liturgical observance is preserved by an intimate union with the See of Rome. The universal canonical legislation of the Church as reorganised in the New Code of Canon Law (1918), the legislation by papal rescript, the decisions in contentious cases by the Apostolic Delegation at Washington, D.C. and a certain number of customs and practices which have grown up in the American Church during the past century and a half of its organised life form the basis for its domestic relations. Every five years each American bishop is expected to pay a visit to Rome (*ad limina Apostolorum*) and to make a report of the condition of his diocese. A system of diocesan synods provides for local unity among the bishops, clergy and laity. Each province is convened into provincial councils from time to time, and at greater intervals a national or plenary council is held. Three national or plenary councils of the American Church have been held (1852, 1866, 1884) at Baltimore.

**Education.**—An outstanding factor in the internal development of the Church in the United States has been in the field of education (*cf.* Burns, *Catholic School System in the United States*, 3 vol., New York, 1907-12). According to the *Official Catholic Directory* for 1925, there are 6,819 parochial or elementary schools, in which 2,072,466 boys and girls receive secular and religious instruction. The principal outlay involved in the parochial school system amounted (1924) to over \$70,000,000. Catholics at the same time contributed their proportionate share to the maintenance of the public schools. There are 218 high schools, colleges and universities for boys and 727 academies for girls. This system of secondary education is crowned by the Catholic University of America, at Washington, D.C., established (1887) by Pope Leo XIII. and the American hierarchy and endowed with the privileges of the old pontifical universities of Europe. The purpose of the founders of this central institution was to carry the graduates of the Catholic colleges into higher scholarship, and thus prepare teachers for the entire Catholic educational system as well as leaders in the world of science and literature. The Catholic Sisters College, founded as an integral part of the Catholic University of America (1914), gives to the religious women teaching in the Catholic schools equal opportunities for higher training.

Between the years 1920 and 1924 the enrollment in Catholic higher schools increased 80%. There are 32% more lay than religious instructors in the Catholic universities and colleges for men. The education of the clergy is provided for by 121 seminaries, in which there are about 13,000 students. A *Directory of Catholic Schools and Colleges for the United States* has been printed (1926), as well as a *Directory of Catholic Charities* (1922).

There are 352 orphan asylums, with 47,825 inmates. Other charitable institutions number over 2,000 and include every form of private and public charity. Annual meetings of the National Conference of Catholic Charities and the Catholic Educational Assn., composed of all those in charge of educational and welfare organisations, maintain the necessary contacts and promote general progress.

**Administration.**—The actual government of the Church in the United States is represented by the Apostolic Delegate at Washington, D.C.; four cardinals (Boston, New York, Philadelphia and Chicago); 14 archbishops (Baltimore, Boston, Chicago, Cincinnati, Dubuque, Milwaukee, New Orleans, New York, Oregon City, Philadelphia, St. Louis, St. Paul, San Francisco and Santa Fé); 103 bishops; 17,681 diocesan clergymen, under the sole and immediate direction of their bishops; 6,671 members of religious orders, subject to episcopal supervision—in all, 23,697 clergymen. There are 11,625 churches with resident priests, and 5,955 mission churches—in all, 17,380 churches, to which must be added several thousand chapels. Several hundred daily, weekly, bi-weekly and monthly publications are printed in English and foreign languages. Many of these are religious in content. Others are diocesan organs for current local Catholic news. There exist also several literary and academic reviews, published monthly and quarterly, of a high order of merit. A *Catholic Press Directory* was published in 1925.

**Historical Events.**—The principal events in the recent history of the Church were: the Third Plenary Council of Baltimore (1884); the First Catholic Congress (1889); the opening of the Catholic University of America (1889); the Catholic Educational Exhibit at the World's Fair in Chicago (1893); the establishment of the Apostolic Delegation at Washington (1893)—Cardinals Satolli (1893–6), Martinelli (1896–1902), Falconio (1902–11), and Bonzano (1911–23) and Archbishop Fumasoni-Biondi (1923– ); the publication of *The Catholic Encyclopedia* (1907–14) in 16 volumes; and the formation of the national Catholic war council (1917), from which grew the national Catholic welfare conference, founded in 1919 (cf. Guilday, "The Church in the United States" (1870–1920) in the *Cath. Hist. Rev.* for Jan. 1921). An event of international importance in Catholic American history was the Eucharistic Congress, held at Chicago, in June 1926.

**National Development.**—Students of the social and intellectual forces of Catholicism in the United States are giving considerable attention to the recent development of the Church along national lines. The change in the immigration policy of the country has rendered this development possible, since it permits the racial elements to be more easily assimilated to national ideals. Many agencies are at work effecting this general evolution. Among them are the Catholic Educational Assn., the National Conference of Catholic Charities, the Catholic Hospital Assn., the Central Bureau of the Central Verein, the American Catholic Philosophical Assn. and the American Catholic Historical Association. All these organisations are aided by the central bureaux of the National Catholic Welfare Conference at Washington, D.C. National organisation is also being effected through such societies as the Holy Name Society, the Knights of Columbus, the Daughters of Isabella and the Catholic Daughters of America, the International Catholic Truth Society and the International Federation of Catholic Alumnae.

An annual meeting of the American hierarchy is held in Sept. at the Catholic University of America, Washington, D.C., for the discussion of mooted points in Church discipline and progress. The national Catholic welfare conference, with headquarters in Washington, D.C., is directed by an administrative committee of bishops, who report annually at the aforesaid meeting. A recent development in the Catholic Church of the United States is the creation of the home and foreign missionary board.

**Mission Work.**—Missionary work has been begun by American priests and sisters in foreign fields. The Catholic Foreign Mission Society of America (Maryknoll, N.Y.), and the Dominicans and the Foreign Mission Sisters of St. Dominic, have

stations in China. The Holy Cross Fathers maintain missions in India. The Catholic Students Mission Crusade is an active participant in these projects. There is a bureau for Catholic Indian missions at Washington, D.C., and a national board for mission work among the coloured people, with headquarters in New York City. In social and educational welfare work the Knights of Columbus, with a membership approaching 1,000,000 men, has occupied a position of leadership.

**Authorities.**—The chief foreign source-collections for the history of the Church in the United States are in Rome (Vatican archives and archives of propaganda), Paris, London (Westminster archives), Seville (archivo general de Indias), Mexico City (national archives), and Quebec (archiepiscopal archives). Transcripts of these documents are in the Shea collection at Georgetown University, in the archives of the Dominican House of Studies (Washington, D. C.), and in the Guilday transcripts at the Catholic University of America. Every episcopal see has its own archives, and considerable material exists at the headquarters of the religious orders and congregations in this country and abroad, particularly in Rome. The Catholic archives of America at Notre Dame University are particularly rich in unpublished material. Printed sources will be found in the quarterly *Records and Reviews* of the Catholic historical societies in the United States. The *Catholic Historical Review* contains bibliographical references for all phases of American Catholic history. Ecclesiastical legislation will be found in the *Acta et Decreta* of the Third Plenary Council of Baltimore. The new code of Canon law has been analysed for American purposes in a supplementary volume of the *Catholic Encyclopedia* (1918).

The literature of American Catholic history both of general and special nature is large in extent, although few works of outstanding merit have been published. Shea's four volumes on the *History of the Catholic Church in the United States* (New York, 1886–92) is still the standard work. The *Catholic Encyclopedia* contains articles on practically every noteworthy aspect of American Catholic history and is especially valuable for biographical sketches. The *Lives of the Deceased Bishops*, in two volumes, by R. F. Clarke (New York, 1872), is generally trustworthy, though inadequate. Statistics are given annually in the *Official Catholic Directory* (New York). The bibliography of American Church history, found in Guilday's *Life of Archbishop Carroll* (1922), gives a list of provincial, diocesan and institutional histories. The American Catholic Historical Assn. (founded in 1919) is preparing a *Guide to the Printed Sources for American Catholic History*. (P. Gu.)

**ROMANONES, ALVARO DE FIGUEROA Y TORRES**, COUNT DE (1863– ), Spanish politician, was born in Madrid Aug. 1 1863, and studied law in his native city and at Bologna. On being elected a member of the Madrid municipality, and soon afterwards appointed its president, he exposed and remedied many of the abuses which characterised that body. He next turned his attention to public instruction, first as parliamentary deputy and later as Cabinet Minister. As minister of agriculture and as Home Secretary in 1905 it fell to him to deal with strikes and riots, and he was compelled to suspend the constitutional guarantees. He became Prime Minister in Nov. 1912, shortly after the murder of Canalejas, and passed a bill conferring limited autonomy on the Catalans. During the World War his alleged partiality towards the Allies was a constant source of public discontent. He was again Prime Minister from Dec. 1915 until April 1917, and for the last time from Dec. 3 1918 until April 15 1919, when he had once more to suspend the constitutional guarantees. He was Minister of Justice Dec. 1922–Sept. 1923, and after Gen. Primo de Rivera's *coup d'état* in that month he published a book in defence of the parliamentary parties entitled *Las Responsabilidades Políticas del Antiguo Régimen de 1875 a 1923* (1924).

**ROMAN RELIGION** (see 23.577).—The period since 1910 has produced one masterpiece upon a large scale, the late Dr. W. Warde Fowler's *Religious Experience of the Roman People* (1911), but in the main advance has been by the more intensive study of detail. The facts about the prehistoric peoples of Italy, if still obscure have been made clearer by archaeologists. A beginning has been made of the collection of data concerning local Italic and Celtic cults, and the cautious use of comparative folklore has thrown light upon particular primitive survivals. Here Eitrem's valuable study of ritual practice might be mentioned, or Rose's recent suggestion, which has hardly yet stood the test of critical examination, that Roman marriage customs point to the original existence of a classificatory system.

*General Tendency.*—In general, however, there has been a sound reaction against wide generalisations based upon random analogies drawn from all parts of the world. Greater attention has been paid to the analysis of the composite religion of historical Rome and to the importance of distinguishing what is Roman from what is Graeco-Roman. For instance, the hypothesis of the existence of early king-gods or of married pairs of deities is now generally abandoned, as being quite inconsistent with what is known of genuinely Roman religion.

*Prehistoric Period.*—As regards the prehistoric period, there are certain religious phenomena (e.g., the *mundus* or the *pomerium*) which seem to find prototypes in the *Terremare* of the Bronze Age. But none of the attempts which have been made to identify Plebeians and Patricians with the two prehistoric racial elements of which the Romans were composed can be said to have succeeded. That the Etruscans, who are now believed to have entered Italy definitely by sea and probably not before the end of the 9th century B.C., made important contributions to Roman religion is certain, though modern, like ancient, authors may be inclined to exaggerate their extent. The most notable were divination by entrails (augury, upon the other hand, is Italic and may go back to the *Terremare*), the practice of temple worship and the cult of anthropomorphic gods.

*Worship of Numina.*—Before Etruscan influences became operative, Roman objects of worship appear to have been not gods, but *numina* or impersonal powers. The difficulty of accounting for the very early existence of two exceptions, Jupiter and Mars, has not yet been solved. About the original character of Mars opinion still differs as to whether he was primarily an agricultural or a warlike deity or a *numen* of growth. That early Romans believed in individual survival after death has become less probable. The view that the *Lar Familiaris* was not a spirit of a dead ancestor but a protector of the fields (see above) has won fairly general acceptance, and there is some evidence to show that while the early Romans performed certain rites in respect of the collective dead the conception of the individual spirit of a dead man or ancestor was quite late in development, possibly under Greek influence.

*Hellenistic Influence.*—In religion, as in all departments of history, increasing knowledge has emphasised the importance of the civilisation of the Hellenistic kingdoms. The most interesting example, perhaps, is provided by the papyrus containing the regulations of Ptolemy Philopator for the control of the Dionysiac societies in Egypt, which almost certainly formed the model for the famous decree of the senate about the Bacchanalian societies.

*Imperial Period.*—As regards the imperial period a great deal of work has been done by Bousset, Norden, Reitzenstein, Clemen and Cumont in two main directions: 1, the investigation of the relation of the later syncretism to heretical forms of early Christianity; 2, the disentanglement of the Greek, Egyptian and Iranian elements in this confusedly composite whole. The systematic examination of provincial cults has also progressed, and archaeological discoveries in Rome itself have been rich in new material particularly as affecting the relations of early Christian to pagan religious art. Outstanding are the paintings of the Via Manzoni with their pagan (?) designs of the Good Shepherd type and the twelve figures which are popularly, though erroneously, supposed to be portraits of the Twelve Apostles. Even more remarkable is the richly painted subterranean basilica of some unidentified non-Christian sect, which was discovered in 1917 near the Porta Maggiore.

**BIBLIOGRAPHY.**—J. Toutain, *Les cultes païens dans l'empire romain* (1907, etc.); F. Cumont, *Oriental Religions in Roman Paganism*, trans. (1911); W. Warde Fowler, *Religious Experience of the Roman People* (1911); S. Eitrem, *Opferrius und Voropfer der Griechen und Römer* (1915); W. Warde Fowler, *Roman Essays and Interpretations* (1920); H. J. Rose, *The Roman Questions of Plutarch* (1924).

**ROME** (see 23,584), the capital of Italy, has become a much healthier city; slum clearances, new drainage works and the removal of the ghetto, have resulted in the gradual disappearance

of Roman and typhoid fever, and a reduction of the death rate to about 19 per thousand. The population in 1925 was 746,783. The housing question has been acute since the World War. In 1925, the Holy Year, some 102,000 pilgrims visited Rome in a period of four months. The Via Quirinale is now called Via Ventiquattro Maggio, in honour of the day on which Italy declared war on Austria, and the Via Nazionale is named in part Via Cesare Battisti, in memory of a man hanged by the Austrians, and in part Via Quattro Novembre. A fine bridge over the Tiber, the Ponte Vittorio Emanuele, was opened in 1911.

Much work has been done on the remains of ancient Rome since 1910. In 1910, in honour of the jubilee of the unity of Italy, the formation of an archaeological park, extending from the Via Appia to the foot of the Aventine and almost to the Aurelian Wall, was approved by Parliament. It contains the Baths of Caracalla, where another corridor was discovered in 1913. The site of the palace of Tiberius has been excavated, and a bath, staircase, etc. found. What is believed to be the "*mundus*," which was venerated in connection with the cult of the *manes* as the centre of the furrow made by Romulus, was found on the Palatine in 1914; it is in the form of a well 40 ft. deep. The state apartments in the palace of Domitian were laid bare between 1909 and 1912, the staircase connecting them with the rest of the palace in 1915, and the domestic offices in 1923. The ground under the Arch of Constantine has been dug away to its original level, and a carriage way made through the arch.

Outside the walls, the ancient aqueducts have been widely explored, and excavations under the Renaissance church of San Sebastiano, 1½ m. beyond the Appian Gate, have resulted in valuable discoveries. In the suburb of Porta Salaria, a *hypogeum*, of which the original purpose is doubtful, has been found. In 1911 zoological gardens were arranged in the grounds of the Villa Borghese, and a fine collection of modern Italian art was opened in the Palazzo delle Belle Arti, to the west of the Villa. In 1922 a museum of antiquities from the Forum was arranged in a building adjoining the church of Santa Francesca Romana; and the Museo Petriano, containing objects connected with the foundation and development of St. Peter's, was opened in 1925.

It was proposed in 1922 to make the barracks and storerooms of the castle of St. Angelo into a topographical museum. The Palazzo Venetia, for long the residence of the Austrian ambassador to the Vatican, came again into Italian hands in 1915, and frescoes of the Renaissance period, by Mantegna and Bramante, have been found in it. Among important modern buildings are the Chamber of Deputies, with its principal front on the new Piazza del Parlamento; the Palace of Justice, near the Castle of St. Angelo; and the Polyclinico, a fine hospital on part of the large site, east and south of the Castro Pretorio, requisitioned by the Government for building a new university, and bringing together various institutions scattered about the city. Of this scheme the hospital forms part. A monument to Victor Emmanuel II., consisting of an immense platform and flights of steps decorated with fountains and figures, surmounted by an equestrian statue, towers above the Piazza Venetia. The Campitello quarter was cleared to make space for it, and it is proposed to extend the Via Cavours to the Piazza. A further municipal scheme of improvement caused apprehension in 1926, lest a portion of the English College should be scheduled for removal.

**RONALDSHAY, LAWRENCE JOHN LUMLEY DUNDAS, EARL** OF (1876- ), British administrator, was born June 11 1876, the eldest surviving son of the 1st Marquess of Zetland and was educated at Harrow and Trinity College, Cambridge. From 1898-1907 he travelled extensively in Ceylon, India, Persia, Asiatic Turkey, Central Asia, Siberia, Japan, China and Burma. In 1900 he was appointed aide-de-camp to the staff of the viceroy, Earl Curzon, in India. He sat in the House of Commons as Conservative member for the Hornsey division from 1907-16. A member of the royal commission on the public services in India from 1912-4 he was appointed governor of Bengal in 1916 in succession to Lord Carmichael of Stirling. He retained this appointment until 1922, when he was created G.C.S.I. and sworn of the privy council. In 1925 it was

announced that Lord Ronaldshay had undertaken to write the life of Lord Curzon.

Lord Ronaldshay published *Sport and Politics under an Eastern Sky* (1902); *On the Outskirts of Empire in Asia* (1904); *A Wandering Student in the Far East* (1908); *An Eastern Miscellany* (1911); *Lands of the Thunderbolt: Sikkim, Chumbi and Bhutan* (1923); *The Heart of Aryavarta* (1925).

**RÖNTGEN, WILHELM KONRAD** (1845-1923), German physicist (see 23,694), received the Nobel Prize for physics in 1901. He died in Munich Feb. 10 1923.

**RÖNTGENOLOGY:** see RADIOTHERAPY AND RÖNTGENOLOGY.

**RÖNTGEN RAYS (X-RAYS)** (see 23,694).—Physical research has spread itself over 60 octaves or more of electromagnetic waves which are now known to stretch without break from wireless waves 25 m. or more in length, through heat waves, visible light waves, ultra-violet waves and X-rays, to gamma rays of wave lengths of the order of a ten thousand millionth of an inch. In this gigantic gamut of natural activity, that group of radiations encroaching into and extending some 13 octaves beyond the ultra-violet, and possessing wave lengths ranging from about  $5 \times 10^{-6}$  to  $5 \times 10^{-10}$  cm. is now generally styled Röntgen rays, or X-rays. Of these 13 octaves, 10 are extremely absorbable, but the remaining three possess those remarkable powers of penetrating matter which made Röntgen's discovery so arresting when it was announced in 1895 (*Wiedemann's Annalen der Physik*, vol. 64, p. 1). If we include the X-rays which radium emits—usually known as gamma rays—this gives a total of nearly 6 octaves of radiation. With these X-rays the science of medical and technical radiology of the present day does its work. (See also RAYS.)

**Dangers.**—At the outset, the dangers to the X-ray worker should be referred to. These dangers are well known and have caused many casualties in the past. They can, however, be wholly avoided by common-sense protective measures which consist in the main of interposing lead sheet or the like, properly disposed and sufficiently thick, between the X-ray tube and the operator. The Reports of the X-ray Protection Committee<sup>1</sup> contain details of complete safeguards.

**Generation of X-rays.**—Röntgen's discovery was made with a Crookes tube, that is, a glass bulb exhausted to a low gas pressure through which a high-tension electric current is passed by means of electrodes provided. If the tube is made of special design, in which a converging stream of high-speed electrons (cathode rays) is arrested at its focus by a heavy metal target, then we have a modern X-ray tube—an instrument with an efficiency of about  $\frac{1}{100}$ %. The X-rays leave the focal spot in all directions (travelling in straight lines with the speed of light). We cannot see them, but they affect a photographic plate or fluorescent screen and they ionise (or render conducting) any gas through which they pass, so that they can be detected and measured by one of these properties.

**Tubes.**—There are two main types of X-ray tubes—the gas tube and the hot cathode tube. In a gas tube an appreciable amount of gas is left at a pressure ranging from 0.001 to 0.01 mm. of mercury. When the exciting potential is applied the residual ions are accelerated and generate many more ions by collision with the gas molecules. The positive ions are directed by the electric field towards the cathode which they bombard and cause to emit electrons which in turn, under the electric field, bombard the target and so generate X-rays.

**Coolidge Tubes.**—In the hot-cathode tubes, with which the name of Coolidge is associated, the vacuum is so high that the residual gas plays no part. The electrons are produced by heating the cathode by means of a subsidiary current. For this purpose the cathode takes the form of a spiral of tungsten wire. Separate and precise control over the exciting voltage and the current through the tube is possible with a hot-cathode tube, a remark which does not apply to the gas tube.

For most practical purposes targets are of tungsten or platinum—metals of high atomic number and high melting point. Much heat is generated at the target, and has to be dissipated

by water-cooling or the like. So-called metal X-ray tubes are now coming into use.

The intensity of the X-rays from a tube is roughly proportional to  $NV^2$ , where  $N$  is the atomic number of the target,  $i$  the current through the tube and  $V$  the exciting voltage. An X-ray unit of intensity is greatly needed for many purposes.

**Excitation.**—The X-ray tube is excited by voltages ranging from, say, 50 to 200 kilovolts; the higher the voltage, the greater the speed of the cathode rays, and the shorter the wave length of the X-rays produced. Such voltages are produced by induction coils, high-tension transformers, or some form of constant potential apparatus. In any event the X-rays are very heterogeneous—a continuous spectrum of X-rays being produced. Duane and Hunt (*Phys. Rev.*, 1915) showed that this spectrum is definitely limited at the short wave end, the position of the boundary depending not on the nature of the target but only on the maximum voltage  $V$  applied to the tube. The relation is given by Planck's quantum equation,  $Ve = h\nu$ , where  $e$  is the electronic charge,  $\nu$  the frequency and  $h$  is Planck's constant. Substituting the accepted values of these constants, we have:—

Shortest wave length in Å.U. =  $12,400 \div$  maximum voltage.

Kaye (*Phil. Trans.*, A., vol. 209, 1909) showed that superposed on this general spectrum of X-rays are the characteristic X-rays discovered by Barkla and Sadler (*Phil. Mag.*, 1906 *et seq.*). These have since been shown to be constituted of groups of spectral lines, the positions of which depend only on the material of the target. For each element there are several groups of characteristic radiations—called K, L, M, N—of which the K group have the shortest wave lengths. Webster (*Phys. Rev.*, 1916) has shown that these radiations are not generated unless the exciting voltage exceeds a value which corresponds to the line with the shortest wave length in each group.

**X-rays and Matter.**—Three things may happen to a beam of X-rays when it passes through a material. Part of it emerges undisturbed and undeviated and in X-ray photography (radiography) outlines the shadow picture on the plate. Part is "scattered" or dispersed, which is equivalent to stating that, while the rays are not altered in quality, or but slightly so, a considerable proportion of them have their direction altered to a greater or less extent. The rest is "absorbed" with the resulting liberation of characteristic X-rays and electrons.

**Scattering Effect.**—As regards "scattering," the effect occurs at all depths and increases with the thickness. The heavier elements scatter proportionately more than the light elements, though, owing to the greater absorbing power of the heavier elements, the scattering effect is usually more evident with the lighter elements. C. G. Barkla (*Phil. Trans.*, 1905) found that scattered rays may show partial polarisation. A. H. Compton (*Phys. Rev.*, 1923) has shown that a proportion of the scattered radiation has its wave length slightly lengthened, as would be anticipated on the quantum theory and a recoil of the electron encountered. Scattering is prejudicial to good definition in X-ray photography and has to be specially guarded against in radio-metallography.

**Absorption Effect.**—As regards "absorption," X-rays can penetrate all substances to an extent depending on their thickness and density and on the wave length of the X-rays. In general, the shorter the wave length the greater the penetrating power though, as will be seen presently, this is not so in special conditions. The power of a material to absorb rays of a particular wave length is usually given in terms of its absorption coefficient  $\mu$  where  $\mu$  is defined by  $I = I_0 e^{-\mu d}$  in which  $I_0$  is the intensity of a beam normally incident on a screen of thickness  $d$ , and  $I$  the intensity of the transmitted beam. For normal absorption  $\mu$  varies as  $\lambda^3$  where  $\lambda$  is the wave length. Ordinary X-rays are heterogeneous, so that  $\mu$  is greater for thin absorbing screens than for thick.

An element shows limited regions of abnormally high absorption for X-rays somewhat exceeding in wave length one of its characteristic radiations. The effect forms the basis of the absorption limits in the spectra first obtained by M. de Broglie (*Jour. de Phys.* 1914, *et seq.*).

<sup>1</sup> Copies can be obtained from the Director of the National Physical Laboratory, Teddington.

**Electrons.**—The liberation of electrons is an effect attendant on the absorption of X-rays by matter. An X-ray of given wave length may give up a part or the whole of its energy to an electron, the energy of the ejected electron being represented by the loss of frequency of the X-ray. In a proportion of encounters the whole of the energy is transferred and the speed of the electron will reach an upper limit. In other cases, de Broglie has shown that only a part of the energy is given up to the electron, the rest being wholly transferred to a group of characteristic X-rays originating in one of the electronic orbits of the atom. (See ATOM.)

**Speed.**—With reference to the upper limit of the speed of the electrons ejected by X-rays, it is found that this value agrees closely with the speed of the cathode rays in the tube which generated the X-rays. This fact strongly supports the quantum theory of X-rays, a theory which has not yet been reconciled with the conception of spreading waves, so clearly indicated by the diffraction phenomena of X-rays. The difficulty, however, is one which is common to all classes of electro-magnetic waves.

**Diffraction of X-rays.**—In 1912 Laue (*Ann. d. Phys.*, 1913) showed that X-rays could be diffracted by crystalline matter (see CRYSTALLOGRAPHY). The regularly spaced layers or planes of atoms in crystals are at the right order of distance apart to diffract X-rays, just as opals and chlorate-of-potash crystals with their stratified layers can diffract visible light. Very similar optical relations connect the wave length of the rays with the angle of reflection from a particular set of atomic planes within the crystal. If we know the wave length we can derive the regular spacing of that set of planes. If we can find the spacings of three main sets of planes, we have thus ascertained the linear dimensions or lattice constants of the unit cell from which, by continued multiplication, the space lattice of the crystal can be built up. Alternatively, if we know the lattice constant for any particular substance we can determine the wave length of the X-rays.

From this momentous discovery of Laue the science of X-ray spectrometry has grown to great proportions. The main developments deal with emission and absorption spectra, with crystal analysis and with the structure of atoms.

**X-ray Spectra.**—In optical spectra the number of lines peculiar to an element are frequently numerous and their numerical relations complicated. X-ray spectra, on the contrary, are noteworthy for their simplicity, the number of lines characterising an element being relatively few, readily recognisable and measurable with a precision not inferior to that which obtains in optical spectra. Moseley's great discovery (*Phil. Mag.*, 1913) established a simple proportionality between the atomic number of an element and the square root of the frequency of a characteristic radiation or of an absorption limit. Moseley's law holds for all the known elements and so it is possible to interpret new spectral lines without the complexity associated with optical spectra. It was by X-ray spectrometry that the element hafnium was discovered in 1923; and in 1925 Monnack and Tacke announced the discovery by X-ray analysis, of two new elements which they called Masurium and Rhenium. Thus 89 out of 92 elements are now known, and the X-ray spectral lines of the missing three elements (atomic Nos. 61, 85, 87) are predictable with certainty (see ATOMIC WEIGHTS and ISOTOPES).

X-ray absorption spectra are very simply obtained by passing a pencil of X-rays through a sample of the matter and examining the transmitted beam by a crystal spectrometer. The X-rays should be excited by a suitably high voltage. The method is specially applicable to all elements with a strong absorption band, and excels in detecting traces of heavy elements in light elements. Emission spectra are conveniently excited by mounting the material on the face of the target of an X-ray bulb and applying a suitably high voltage. In such spectra every element present is recorded with an intensity which appears to depend only on its concentration and is independent of the presence of any other elements with which it may be mixed or combined. The test, which is very sensitive, is specially applicable to analysis of the platinum group of metals and the rare earths.

**Crystal Analysis.**—The aim of X-ray crystal analysis is to determine the grouping of the atoms and molecules in the crystal unit, and so to account for the properties of the crystal. The main experimental methods due to Laue, Bragg, Hull, Debye and Scherrer are described in CRYSTALLOGRAPHY. X-ray analysis has shown that most chemical elements, including solidified gases, crystallise in the cubic or hexagonal systems. Already nearly half the elements have been examined, including those allotropes which can arrange themselves in more than one kind of space lattice. As regards alloys, the X-rays have tested the truth of the existence of the several phases of steel and other alloys which metallurgists had differentiated by other means (see METALLOGRAPHY). The method has also indicated the atomic features which go hand in hand with ductility, malleability, hardness, etc. It has also been shown that in a solid solution of two elements the replacement of one atom by another is effected by substitution in and distortion of the lattice and not by interstitial insertion. Other points which have been worked on are the effects of annealing, tempering, rolling or other working; the mechanism of deformation and slip in metals; and the general shapes and sizes of atomic domains.

By the use of X-rays, Sir Wm. Bragg has shown that a diamond has an atomic bonding perfect in its symmetry and so possessing intense hardness. On the other hand, graphite (another variety of carbon) with unsymmetrical atomic linking, with weak linking and greatest separation between cleavage planes, is a good lubricant. So-called amorphous carbon is found to consist of minute graphite crystals. The fragility of annealed tungsten lamp filaments is explained by the gradual transformation to a number of single crystals of large dimensions.

**Crystalline Forms in Nature.**—The X-rays have demonstrated that almost every solid substance in nature shows crystalline form, including such apparently amorphous materials as rubber, cellulose, the fatty acids, soap, leather, bamboo and talc. Colloidal metals are shown to be made up of minute yet perfect crystals so small that they contain only a few score atoms. The molecular arrangements in thin metal and liquid films have been ascertained. In gold leaf, for example, the cubic crystals are found to have their cube faces parallel to the sheet. The method has also been used to ascertain the crystal axes of jewel bearings, and to distinguish between natural and cultivated Japanese pearls.

**Medical Applications of X-rays.**—The great improvements of recent years in X-ray equipment and technique have given the diagnostic methods of physicians and surgeons a facility and exactitude never dreamt of at one time. X-ray snapshots of any part of the body can now be taken. The detection of foreign bodies is commonplace. Gouty and rheumatic joints, stones in the kidney and gall bladder, incipient tuberculosis in the lungs and joints, tumours, etc., are among the diseases readily displayed. The examination of the alimentary canal is facilitated by the use of opaque meals containing bismuth or barium salts. Dental radiography has made great progress. The X-rays possess valuable properties in the treatment of certain diseases, such as lupus, rodent ulcers, ringworm and skin eruptions. The precise "dose" is important (see RADIOTHERAPY and RÖNTGENOLOGY).

**Industrial Applications of X-rays.**—The differential absorption of X-rays by different sorts of matter and, as already noted, the diffraction of X-rays have been turned to account in the industries and arts in a variety of directions. Many of the various applications of radiography to industry have come about owing to the fact that the method does not injure the specimen in any way. Further, it provides, in many cases, the only means independent of human judgment of detecting concealed defects in a material or of scrutinising in a structure or sealed enclosure the disposition of component parts which are hidden from view. Incidentally, the mere existence of the method is not without its moral effect on the workman.

Experience differs as to the sensitiveness of the method, but, depending on the area of the inclusion, probably a variation in density equivalent to 2 to 5% of the thickness is necessary to be detected on the photographic plate. These figures require to be

increased for fluoroscopy, but much depends on the luminosity and on the visual acuity of the observer. Definition is, of course, dependent, among other things, on the size of the focal spot in the X-ray tube. Exposures naturally depend on the conditions, and may vary from a few seconds to an hour or more.

As regards the use of X-rays in radiographing steel, while 4 in. is the maximum thickness penetrated so far in the laboratory, the present practicable limit is more nearly 2 in. for photography. Radiography is useful, among other directions, in examining castings and welds, for detecting foreign metallic matter in electrical insulators and for testing the centrality of golf balls, the proportion of ash in samples of coal, and the accuracy of assembly of explosive devices. The X-rays have also proved of service in supplementing the tests for detecting fraudulent antiques and Old Masters.

**ROOSEVELT, THEODORE** (1858–1919), 26th President of the United States (see 23.707), completed his second term, March 4 1909, the most famous man in his country, with a wealth of personal friends and a reputation as a master of men. Yet from the presidency, like most of his predecessors, he stepped down into a retirement which seemed to forbid a re-entry into public life or a recovery of the headship of his party. In the 10 remaining years of his life he displayed the same qualities of intense thought and action that had characterised him before; within a year after his withdrawal he again became a great force in American society and public life. A sense of fair play to his successor, President Taft, for whose choice he was indeed responsible, and that drawing force of the unknown to which his nature was susceptible, led him to make plans for a hunting and exploring trip in Africa, some months before the end of his presidential term. He was also influenced by invitations to make addresses in England and France.

Accordingly he sailed from New York, on March 23 1909, for Africa, where, in conjunction with his son Kermit and the well-known hunter Selous, he travelled a long distance, shot big game and safely emerged at Khartum in March 1910. Here he plunged at once into politics by addresses at Khartum and Cairo, in which he stood for orderly and vigorous government for Egypt. In both instances the addresses were requested and approved by the local military authorities. From Egypt he proceeded to Europe, and, apparently to his own surprise, found himself an international celebrity. He was received in all the courts of central Europe except the Vatican, where an official interposed between him and the Pope by stipulating guarantees of his conduct in Rome. He left a most interesting account of the impressions made upon him by this journey in a long and intimate letter written at the time to the English historian Sir George Trevelyan and published in Bishop's *Theodore Roosevelt and His Time*. It was in vain for him to claim that he was only a "private citizen with no claim to precedence"; for everywhere he was received with the honours ordinarily paid only to sovereigns. He was warmly received in France, where he made a public address at the Sorbonne. In England, his Romanes lecture at Oxford, and particularly his Guildhall speech on the management of a great empire, were noteworthy; and he was designated by President Taft to represent the United States at the state funeral of Edward VII. His most striking experience was in Germany, where he was received with cordiality by the Emperor, but, as he said afterwards, it was the only country in Europe where he felt that "every man, woman and child was my natural enemy—that is, the enemy of my country."

Returning to the United States, June 18 1910, Roosevelt found that both his African and European experiences had been followed closely by the American people. President Taft had now had a year and a half of experience with the country, with Congress and with reforms and policies which Roosevelt had

initiated and expected would be carried out. There was a rift in the Republican party. Some of Roosevelt's friends were in opposition to the Taft administration. In the Ballinger controversy over western public lands, Roosevelt sided against the administration. A group of dissatisfied Republicans, the "insurgents," had arisen in Congress and prepared to dispute the supremacy of the Conservatives in the party, on whom Taft seemed to be relying. To Roosevelt's mind, the "mossbacks" were in control; and a few hours after landing he agreed to throw his personal influence on behalf of Gov. Hughes of New York, who was engaged in a struggle with the Republican Legislature over the direct primary. He made an address at Osawatimie, Kan., Aug. 31, in which he laid down a radical programme of political and social reform to which he gave the name of the "New Nationalism." Plainly he was dissatisfied with Taft's administration. As early as Nov. 21 he discussed with an intimate friend the possibility of his accepting the nomination in 1912, to succeed Taft in the presidency. Through 1911 this quarrel grew. Soon after returning, Roosevelt became an editorial writer, bearing a free lance, in *The Outlook*, and alike in his editorials and in public addresses he took the side of the insurgent element. He regarded Taft as the representative of "the interests." Early in 1912 a group of seven Republican governors united in an appeal to Roosevelt to declare his willingness to be nominated. On Feb. 12 Taft made a bitter speech, in which, without mentioning Roosevelt, he spoke contemptuously of the extremists. This seems to have been the incident that decided Roosevelt's course; for on Feb. 26 he came out openly as a candidate for the nomination by the party convention in June.

Meanwhile the usual campaign for the choice of delegates to the Convention was going on, following the same lines as in 1908. In the southern states, where the Republicans were hopelessly in the minority, delegates were elected by the usual rump and machine-led state conventions. Roosevelt's friends made a campaign in the northern and western states, especially in those which had provided for a choice of delegates through a popular vote in party primaries. A majority of the Republican voters in those states favoured Roosevelt. When the Republican Convention met in Chicago June 22, Taft was strong in the delegations chosen by state and local conventions; and Roosevelt in those representing a predominance of Republican voters. The organisation of the Convention, however, was in the hands of the Taft men, because they had a large majority in the National Committee. Out of the numerous contested seats, only six were finally assigned by the Committee of Credentials to the Roosevelt column. On a test for the choice of temporary chairman, the Taft men showed a narrow margin. The turn of 15 votes—which might have been secured had Roosevelt come out a few weeks earlier—would probably have brought on a "landslide" for him. A speech by Roosevelt a few weeks earlier before the Ohio Constitutional Convention, advocating the "recall" of judicial decisions, also gave alarm to some men who might otherwise have supported him. Once organised, the Taft forces were able to carry through the report of the Committee on Credentials, which assigned them a safe majority.

Roosevelt himself had come to Chicago a few days before the Convention, and was the centre of the hardest battle of his life. He rallied his supporters and addressed an enormous public meeting, ending his speech with "We stand at Armageddon, and we battle for the Lord." Most of his followers stood by him; but they could not break down the walls of precedent and conservatism. The Roosevelt delegates, on their leader's request, remained in the Convention until the end, but refused to vote on the nomination; and Taft was duly nominated for a second term by the vote of about two-thirds of the Convention.

Roosevelt was a party man, who had stood by the party in 1884 when many of his friends bolted. His standpoint in 1912 was that he was trying to save the Republican party from a ruinous yielding to the forces of organised wealth and reaction. He was also a fighter, and felt himself deprived, by technicalities and personal hatreds, of an honour which the majority of his party was eager to bestow upon him. He unhesitatingly decided

to "bolt," and on the evening of the adjournment of the Convention, at a meeting in Orchestra Hall, he advised the formation of a Progressive party. A later Convention of the Roosevelt men throughout the country, including a considerable number of Democrats, nominated Roosevelt, with Gov. Hiram W. Johnson of California for vice-president. Meanwhile the Democrats had nominated Woodrow Wilson, governor of New Jersey. The result was a three-cornered political contest, in which it was clear at the beginning that Taft could not be elected, but that Roosevelt probably could not win enough Democratic votes to prevent the choice of Wilson. Nevertheless, Roosevelt fought vigorously through the campaign, violently attacking Taft as a reactionary and tool of reactionaries. While on a speaking tour at Milwaukee he was shot by a fanatic, but was not seriously injured.

The result of the election was the choice of Wilson, who had 6,000,000 popular votes and 435 electoral votes; Roosevelt, 4,000,000 popular votes and 88 electoral; Taft, 3,500,000 popular votes and 8 electoral. On this showing the Progressives had more votes than their Republican adversaries and therefore hoped to compel a reconstruction of the party. Their Republican opponents, however, kept tight hold of the name, organization and prestige. They had deliberately accepted defeat in advance in order to put Roosevelt out of the running.

This, the first serious defeat that Roosevelt had ever encountered, was to him a bitter humiliation. He felt that his public career was ended. His first movement was characteristic. He had cordial invitations to visit South America and make addresses in the principal cities. As in his experiences of 1910, this dovetailed in with a plan of exploration. Accordingly, early in 1913, after visiting several South American countries, including Brazil and Argentina, he returned to Brazil, made his way overland, and came down a river, whose uncharted course he followed for 600 miles. The hardships were severe, and he received an injury, serious for a time, and drew into his system the seeds of tropical malaria. The Brazilian Govt. named the stream Rio Teodoro.

On his return to the United States, out of office, a defeated candidate, an insurgent, the personal enemy of the Republican leaders, he seemed justified in his belief that his career was over. But as usual his enemies played into his hands. An obscure journalist ventured publicly to accuse him of drunkenness. In May 1913 he instituted a suit for defamation of character, with the result that the defendant broke down and acknowledged his error. A large section of the American people resented the affront and rejoiced in the vindication. During this period Roosevelt was indefatigable as journalist and writer, first in *The Outlook*, then in the *Metropolitan* magazine and finally through the columns of the *Kansas City Star*.

The outbreak of the World War gave him a new opportunity for his pen and voice. His instinct was against Germany as an oppressor of weak nations; but he stayed his desire for positive action for a time, from the feeling that he ought not to embarrass the President. It was at this time that a personal enemy gave Roosevelt the opportunity of again showing his character to his countrymen, through a publicity which both Roosevelt and the public enjoyed. William Barnes, one of the acknowledged leaders of the Republican party, brought a suit in April 1915 against Roosevelt because of an accusation of unfair and corrupt politics as a "boss" which Roosevelt had made against him. Roosevelt vigorously defended himself and won the suit. For 10 days he was on the witness-stand, and his testimony, which was spread broadcast throughout the land, revealed his undiminished force and appealed to the popular imagination.

The sinking of the "Lusitania" by a German submarine in May 1915 brought his bitterest denunciation, and from that time he foresaw first the possibility and then the likelihood of war between Germany and the United States. He made himself the leading spokesman for "preparedness," and presently drew down the wrath of President Wilson's administration for a speech at Plattsburg. From that time he did not spare sharp criticisms of President Wilson's policy as showing unwillingness

to face the dangers of war. His utterances against Germany and in favour of the Allies had great influence. As the election of 1916 drew near, the remaining Progressives, aided by some who had stayed in the Republican party, made an effort to force the Republican Convention to nominate Roosevelt. They called a Progressive Convention to meet at Chicago at the same time as the Republican, hoping to make a joint nomination with the Republicans. Roosevelt did his best to secure the prize, but again the party leaders would have none of him. Hughes was nominated, and this time Roosevelt accepted the situation as a loyal member of the Republican party and supported the nominee.

As the World War went on, Roosevelt became the severest critic of the administration and the strongest advocate of preparedness. He formed a plan for raising a special division, in which he hoped to have a command, and which he would offer to the Government. Early in 1917, when the American breach with Germany came, he offered the services of himself and his sons, all four of whom subsequently enlisted. He requested that he might have a personal command, which was denied by the Administration, although both Houses of Congress united in a bill making his plan possible. During the year he made some of the most notable addresses of his life, especially that before the "Order of Moose" convention in Pittsburgh. By this time the Republican politicians were looking forward to the election of 1920 and began to group themselves about Roosevelt. His most persistent enemies, even William Barnes, accepted his nomination as a foregone conclusion. The year 1918, however, was a sad one for Roosevelt. His son Quentin was killed in the War. Ever since returning from Brazil, Roosevelt's constitution had shown weakness. He was several times in hospitals, and underwent a serious operation for abscess due to infection received during his Brazilian explorations. The hearing of his left ear was wholly destroyed. Still, he continued his writing and speaking and his direct personal influence upon his thousands of friends. Even in the first days of 1919, when he suffered from renewed disease, he looked forward to public service. On Jan. 6 1919 he died in his sleep.

A man who could do so much could not do everything perfectly, though few have ever done so many things so well. It was more true of him than of most men that his defects were inherent in his virtues. There were few half-tones in Roosevelt's moral perceptions and fewer in his vocabulary; he saw things as either black or white, and he forgot sometimes that he had not previously seen them as he saw them at the moment. He had enemies, and even former friends, who charged him with breaking promises, betraying political associates and setting his own wishes and interests above all others. The very intensity of his convictions sometimes blinded him to the sincerity and even to the justice of other points of view. Nevertheless, this intensity, this moral fervour, gave his ideas a momentum and a success which they could never have acquired had they proceeded from a more judicial mind. He scorned "weasel words," and on occasion he did not hesitate to describe his enemies as thieves and liars. His remarkable energy reminded observers of some great elemental force which, like any natural phenomenon, is controlled by its own necessary laws. When Lord Morley was leaving the United States in 1904 he was asked by reporters what in America had impressed him most. "Two things," he replied, "Theodore Roosevelt and Niagara Rapids."

His fearlessness was as conspicuous as his energy. With a courage very rare in political life he attacked the iniquities that had crept into the conduct of American business. He asserted the importance of personal rights when these were being openly denied in the name of property rights. He rallied the patriotic elements of the country against the menace of a private "money power" which not only had frequently dictated the course of legislation but threatened to usurp the authority of the Government itself. He felt strongly that any position involving the exercise of power had its obligations as well as its privileges, and this feeling lent force to his denunciation of "predatory interests" and "malefactors of great wealth." On the other hand, he had little patience with demagogic attacks

on men or corporations merely because they were rich or successful, as was shown in his famous utterance in which he compared the authors of these journalistic attacks with the "muckrakers" in *Pilgrim's Progress*. It was said of him satirically that he had invented the Ten Commandments; but Roosevelt's earnestness in behalf of old truths was of the essence of his service to his countrymen, and more important at the juncture than the discovery of new ones.

His great personal power was used in the furtherance of honesty, fair dealing and patriotic service, when more than lip service to these virtues was vitally needed. He threw all his energy into the effort to bring about a reapplication of fundamental moral principles to American business and political life. While he was unquestionably an astute politician, the secret of his success lay in his imaginative understanding of the views and feelings of his countrymen: his enthusiasm was contagious because he vividly expressed what they already felt and believed to be the truest American ideals. When he spoke for the "square deal," the American people as a people always responded.

Born of a wealthy family, in an aristocratic society, enjoying all his days a literary and artistic atmosphere, he was still a natural democrat. He had a personal interest in every man or woman that he met, and a genuine affection literally for thousands of individual persons. He was a scientific man whose observations and deductions were valued by naturalists and investigators. He was a literary man, very widely read. He was an intellectual man, interested from youth to age in literature and philosophy. He was a politician without a rival in his time for boldness, foresight and an innate knowledge of what his fellow countrymen were thinking about. He was a statesman of the most brilliant ability, who after a crushing defeat returned to power over the minds of the people and was on his way again to the presidency of the United States. His bitterest political enemies accepted his coming back to national leadership. To few men in history has it been given to wield such far-spreading and wholesome personal influence.

**BIBLIOGRAPHY.**—Between 1909-19 Roosevelt published about 15 books, several of them consisting of articles and addresses. The more important are *African Game Trails* (1910); *Conservation of Woman-kind and Children* (1912); *Theodore Roosevelt, an Autobiography* (1913, contains little beyond 1909); *Life-Histories of African Game Animals* (2 vol. 1914); *A Hunter-Naturalist in the Brazilian Wilderness* (1914); *Through the Brazilian Wilderness* (1914); *A Book-lover's Holiday in the Open* (1916). His principal later books on public affairs and on the World War are *Realisable Ideals* (1912); *America and the World War* (1915-9); *Fear God and Take Your Own Part* (1916); *National Strength and International Duty* (1917); *The Great Adventure* (1918). Numerous collections of extracts and speeches have been published, especially those of W. F. Johnson (1909); L. F. Abbott (*African and European*, 1910); W. Griffith (1919); J. B. Bishop, *Letters to His Children* (1919); *Letters to Anna Roosevelt Crowley, 1870-1918* (1924); *Selections from the Correspondence of Theodore Roosevelt and Henry Cabot Lodge, 1884-1918*, 2 vol. (1925). A complete memorial edition of Roosevelt's works, edited by H. Hagedorn, has been published in 20 vol. (1923-5).

The most important biographies are those by J. B. Bishop (1920); H. Hagedorn, *Boy's Life of Theodore Roosevelt* (1919); W. D. Lewis (1919); W. R. Thayer (1919); Bradley Gilman (1921) and H. Hagedorn's *Roosevelt in the Bad Lands* (1921). See also J. F. Rhodes, *The McKinley and Roosevelt Administrations, 1897-1909* (1922); and J. Dennett, *Roosevelt and the Russo-Japanese War* (1925). A useful list of books by and about Roosevelt is J. H. Wheelock's *Bibliography of Theodore Roosevelt* (1920). See also *Root's Administration* (A. B. H.)

**ROOT, ELIHU** (see 23, 711).—Upon Mr. Root's return in 1910 from The Hague, where he had acted as chief counsel for the United States in the Atlantic Fisheries Arbitration, he was appointed by President Taft a member of the Permanent Court of Arbitration. In the same year he was elected President of the Carnegie Endowment for International Peace, an institution created by Andrew Carnegie to administer, in the interests of peace, the income of a fund of ten million dollars provided by the latter for that purpose. Mr. Root thus took up again the work which he had initiated when Secretary of State, and became the recognised leader of the peace movement in the United States. He strongly supported in the Senate the treaty of obligatory arbitration concluded between the United States and Great

Britain in 1912, but failed to prevent amendments to the treaty being inserted during its passage through the Senate which prevented an exchange of ratifications. His pacific tendencies were also exemplified in his support of President Wilson in the matter of the repeal of the preference given to American coastwise shipping passing through the Panama Canal. Great Britain had protested against the Panama tolls as contrary to the Hay-Pauncefote Treaty of 1901, and at the instance of the President the discrimination against Great Britain in this respect was removed. In 1913 he was chosen President of the Hague Tribunal of Arbitration between Great Britain, France and Spain for the settlement of claims against Portugal arising out of alleged confiscation of church property in that country. Owing to the World War it did not meet till 1920 when it heard the case at The Hague, its decision being accepted by the litigating parties.

He took a leading part in the passage of the Federal Reserve bill of 1913, providing for a Federal Bank under Federal control, in order to stabilise the finance of the country—a system which has stood the test of experience in war as in peace. In matters of foreign policy also his opinion had great weight. In 1915 a treaty negotiated by Secretary of State Bryan with Colombia provided for payment by the United States of \$25,000,000 to Colombia in settlement of all outstanding claims between the two countries arising out of the independence of Panama. Mr. Root opposed ratification, principally because a statement of regret on the part of the United States which had been inserted in the preamble seemed to him to be an admission on the part of the United States of conduct in the matter inconsistent with the friendly relations of the two countries, though he also considered the sum too much. His opinion prevailed, and later on, in 1922, when the Senate finally ratified the treaty, the clause in question was omitted.

Heretofore, Mr. Root's career had been, on the whole, not unlike that of any other conscientious man of affairs. The outbreak of the World War, however, and the position of the United States as the leading neutral power in a conflict the exigencies of which appeared to test all principles of international law, gave him a new environment. International questions of great moment were forced to the front. Although President Wilson was in control of the foreign policy of the United States, Mr. Root was recognised as an outstanding figure. He was personally known to many European statesmen in whom he had inspired confidence by reason of his judicial mind and breadth of view; and, though a Republican, his Democratic opponents conceded to him an honesty of purpose which made his words carry great weight in his own country.

In matters concerning the World War, he strongly condemned President Wilson's policy, believing that Germany's invasion of Belgium was not only a violation of the rights of Belgium, but a violation of the neutral rights of all neutral nations, which they could, and should, protest. He was opposed to the President's ship purchase bill, the object of which was to empower the Govt. of the United States to purchase and operate German vessels then interned in U.S. waters. The purchase of these vessels would have been in his opinion, an unneutral act, inasmuch as it would compensate Germany for property which it could not use, since, had the vessels left American ports, they would have been captured by British cruisers. Further, the operation of the vessels so purchased, if the enemies of Germany had permitted it, would have caused the United States to embark upon business which would better remain in private hands. The bill failed to pass.

On March 4 1915 his term as Senator expired and he declined to be a candidate for re-election. That summer he was president of the New York State Constitutional Convention, and advocated, among other measures, the short ballot, means for remedying the law's delays, the reduction of costs involved in the administration of justice and measures which would facilitate the impeachment of unworthy public officials. In the course of the Convention he delivered an important address against "invisible government." Mr. Root, as Secretary of War, immediately

following hostilities with Spain, had seen with his own eyes the dangers of unpreparedness. Upon the outbreak of the World War, he immediately urged that steps be taken to place the United States on a war footing, foreseeing that if the nation did not go to the War, the War would come to her. After the declaration of War by the United States, on April 6 1917, he gave his whole support to the Government. He was asked by President Wilson to head the mission which was sent to Russia shortly thereafter with a view to encouraging the Revolutionary Govt. under Kerensky, to carry on the War with vigour. He accepted, but whilst in Russia the overthrow of the Moderates there by the Bolsheviks under Lenin frustrated the purposes of his mission.

At the conclusion of the War, though not a member of the U.S. mission to Paris to conclude peace, his advice was requested in the matter of the Covenant of the League of Nations and his views prevailed to a certain extent. To the Covenant as actually drafted, however, he was opposed. He was, nevertheless, of the opinion that the Covenant and the Treaty of Versailles should be accepted with reservations, to secure the interests of the United States, inasmuch as the President's re-election in 1916 and his presence as negotiator at Paris had led, however erroneously, the other plenipotentiaries to believe that he represented the opinion of his fellow countrymen. In Mr. Root's opinion it would be better to accept the Covenant with reservations, and by subsequent amendments to remove the obstacles which had originally stood in the way of its acceptance.

He accepted an invitation from the League of Nations to become a member of the Advisory Committee of Jurists which met at The Hague in 1920 for the purpose of devising a plan for a Permanent Court of International Justice, in accordance with Art. 14 of the Covenant. His presence enabled the committee to frame a plan acceptable to all by which the judges were to be elected by the separate and concurrent action of the Council (in which the Great Powers had a preponderance) and the Assembly (in which the Small Powers were in a majority), each interest, real or alleged, having thus a veto upon the abuse of power by the other. The plan was accepted with modifications by the Council and Assembly on Dec. 14 1920 and became the Statute of the Court. It functioned perfectly when the judges were elected in 1921, and the Court held its opening session in the Peace Palace at The Hague, Feb. 15 1922. Thus Mr. Root's original proposition made at the Hague Conference in 1907 saw its fruition 13 years later.

Mr. Root was appointed by President Harding one of the U.S. delegates to the International Conference on Armament Limitation, which met at Washington in Nov. 1921. There he secured the adoption of the convention subjecting submarines to the requirements of surface vessels and prohibiting the use of noxious gases in warfare. He devised the Pacific agreements which resulted in the cancellation of the Anglo-Japanese offensive and defensive alliance, and drafted the Four Power Pacific Treaty, which took its place. By this latter treaty the so-called Great Powers, the United States, the British Empire, France and Japan, agreed to respect their rights in relation to their insular possessions in the region of the Pacific ocean and in case of dispute to resort to a joint conference instead of arms. He also brought about the series of agreements on Chinese policies which secured the relief of China from aggression on the part of the Great Powers, and precluded preferential treatment of any of them in Chinese lands. The main idea, underlying the treatment of China by the conference was, as Mr. Root later stated, the encouragement of reforms in that country which would place it upon an equal footing with other nations and bring about the abolition of extraterritorial rights of nationals of other nations in Chinese territory.

He was prominent in the organisation in 1923 of the American Law Institute, which is engaged in a re-statement of the principles of American law with the view of doing away with the existing mass of precedent or case law. When completed this will be in effect, though not in form, a codification of the law. In 1924 Mr. Root resigned the presidency of the American Society of International Law, an office which he had held since the

birth of the society 17 years previously. In 1912 he was awarded the Nobel Peace Prize. (See PERMANENT COURT.)

A collection of Mr. Root's public addresses has been edited by Robert Bacon and James Brown Scott in six volumes, as follows: *Addresses on Government and Citizenship* (1916); *The Military and colonial policy of the United States* (1916); *Latin America and the United States* (1917); *Miscellaneous addresses* (1917); *North Atlantic Coast Fisheries Arbitration. Argument on behalf of the United States* (1917); *Men and Policies* (1924); He also published *Experiments in Governments and the Essentials of the Constitution* (Princeton Lectures, 1913). (J. B. S.)

**ROSCOE, SIR HENRY ENFIELD** (1833-1915), British chemist (see 23.725), died at Leatherhead, Surrey, Dec. 18 1915.

**ROSEBERY, ARCHIBALD PHILIP PRIMROSE**, 5TH EARL OF (1847- ), British statesman (see 23.731), took an active part in the constitutional crisis in 1910 and 1911. He treated the Parliament Bill as a revolutionary measure, which in effect constituted single-chamber government, and did his utmost to arouse the nation to a sense of its danger. While, however, he bitterly condemned the conduct of ministers in going to "a young and inexperienced King" for contingent guarantees, he declined to follow the extreme course, recommended by the "Die-hards," of rejecting the bill. He shrank from the scandal of a great creation of peers. If the bill were allowed to pass, the House of Lords would be left with some vitality; if the creation of peers were forced, they would have none at all. He showed his own estimate of the impotence of the House after the passage of the bill by ceasing to attend its debates; and indeed he took no further part in public life till the outbreak of war in 1914 fired his patriotism. As lord-lieutenant of Midlothian and Linlithgowshire he promoted recruiting and other warlike activities among his own people and helped to hearten the nation and to avert a premature peace by occasional speeches. In 1921 he published a number of collected papers under the title of *Miscellanies: Literary and Historical*.

Lord Rosebery was created Earl of Midlothian in the peerage of the United Kingdom—the earldom of Rosebery being a Scottish earldom—at the coronation of King George in 1911, at which ceremony, as at the coronation of King Edward, he was one of the lords who bore the canopy. He became chancellor of Glasgow University in 1908, as he had long been chancellor of London University, and he was chosen lord rector of St. Andrew's University for the year of its quincentenary celebration in 1911.

The World War cost Lord Rosebery his younger son, Hon. Neil Primrose (1882-1917), whose political advance had been watched by his father with eager sympathy. He became a member of Parliament in 1910, was Under-Secretary for the Foreign Office in 1915 and parliamentary secretary for munitions in 1916. But these appointments were only held in the intervals of fighting as a captain in the Buckinghamshire Hussars, and he died of wounds received in action in Palestine on Nov. 18 1917.

**ROSEGGER, PETER** (1843-1918), Austrian poet and novelist (see 23.734), died June 26 1918.

**ROSENTHAL, TOBY EDWARD** (1848-1917), American painter (see 23.735), died in Berlin, Germany, Dec. 28 1917.

**ROSENWALD, JULIUS** (1862- ), American merchant and philanthropist, was born in Springfield, Ill., Aug. 12 1862, and was educated in the public schools. From 1885 to 1906 he was president of Rosenwald and Weil, clothing manufacturers, Chicago. In 1895 he became vice-president and treasurer of the mail-order house of Sears, Roebuck and Co., Chicago, and in 1910, president. The gross sales of the company, which were \$1,750,000 in 1896, increased under his management to \$258,300,000 in 1925. He was during the World War a member of the Advisory Commission of the Council of National Defence by appointment of President Wilson. In 1919-20 he served in Washington as a member of the President's Industrial Conference. He devoted much time to work for philanthropic, educational and civic organisations. He gave \$250,000 to the fund for Hampton-Tuskegee (negro educational institutions), \$250,000 for a building to house Jewish philanthropic organisations of Chicago; and

(with Mrs. Rosenwald) \$1,750,000 for new buildings for the University of Chicago. He founded dental infirmaries in the Chicago public schools. During the World War he gave large sums to relief organisations, donating \$1,000,000 in 1918 alone. In that year he went on a special mission to France for the Secretary of War. He materially assisted the Hoover Children's Relief Fund in 1920-1 and encouraged the building of rural schools for negroes in the southern states by offering to pay part of the cost. By 1926 more than 3,100 such buildings had been provided, having 353,500 pupils with 7,850 teachers. These buildings cost \$13,250,000. The Julius Rosenwald Fund supplied \$2,350,000, the remainder coming from public funds and white and negro individuals. Mr. Rosenwald also interested himself in helping to provide Y.M.C.A. buildings for negroes in cities, contributing up to 1926, \$450,000 toward the cost of 18 buildings in 16 cities. These buildings cost more than \$3,000,000 and served a negro urban population in excess of 1,000,000. He was appointed a trustee of the University of Chicago, Rockefeller Foundation, Hull House in Chicago, the Baron de Hirsch Fund and of Tuskegee Institute.

In Dec. 1921 it was announced that Mr. Rosenwald had pledged \$21,000,000 to safeguard the interests of Sears, Roebuck and Co. during the critical period of business readjustment after the World War. In 1920 and 1921 the company had paid no dividends on its common stock and it was apparent that its accounts at the end of 1921 must show a deficit. But Mr. Rosenwald by his action enabled the company to readjust its finances without impairing its capital stock, and protected its stockholders, many of them employees. It was recognised generally that he established a precedent which raised the standards of business when he thus risked heavy loss to protect those who had bought shares because of their confidence in his leadership.

**ROSS, SIR GEORGE WILLIAM** (1841-1914), Canadian politician (see 23.739), was knighted in 1910. He published, amongst other works, *The Life and Times of the Hon. Alex. Mackenzie* (1892) and *Getting into Parliament and After* (1913). He died March 8 1914.

**ROSS, ROBERT BALDWIN** (1869-1918), British art critic, was born at Tours, France, May 25 1869, a son of the Hon. John Ross, a distinguished Canadian lawyer. He was educated privately and at King's College, Cambridge, and made a reputation as a critic of art and letters. He became recognised as a leading authority on many questions concerning the worth and valuation of works of art, and was an additional trustee of the National Gallery. He had high repute also as a wit and conversationalist, being to the last a faithful friend of Oscar Wilde, whose literary executor he was. A widely subscribed testimonial by his friends was devoted by Ross to the foundation of a "Robert Ross" scholarship at the Slade School. He died in London Oct. 5 1918.

**ROSS, SIR RONALD** (1857- ), British physician and bacteriologist, was born at Almora, India, May 13 1857. He studied medicine at St. Bartholomew's Hospital, London, and in 1881 entered the Indian medical service. In 1892 he commenced a series of special investigations on the subject of malaria, and by 1895 had arrived at his theory that the micro-organisms of this disease are spread by mosquitoes (see 17.463; 20.786). In 1899 he retired from the Indian medical service, and devoted himself to research and teaching, joining the Liverpool school of tropical medicine as lecturer, and subsequently becoming professor of tropical medicine at Liverpool University. In 1913 he became physician for tropical diseases at King's College, London, and later, director-in-chief of the Ross Institute and Hospital for Tropical Diseases. During the World War Ross was appointed to the R.A.M.C. and became War Office consultant in malaria. In 1902 he received the Nobel Prize for medicine, in 1911 a K.C.B. and in 1918 a K.C.M.G. He received the Royal Medal of the Royal Society, of which he was a fellow in 1901. He was editor of *Science Progress*, and his other publications include *The Prevention of Malaria* (1910), *Philosophies* (1910), *Psychologies* (1919), *The Revels of Orsera*, a romance (1920) and *Memoirs* (1923) as well as mathematical and medical works. (See MALARIA.)

**ROSTAND, EDMOND** (1869-1920), French dramatist (see 23.754), devoted himself during the World War chiefly to the writing of patriotic verse. He died in Paris Dec. 2 1920.

The following posthumous works were published: *La dernière nuit de Don Juan* (1921); *Le cantique de l'aile* (1922); *Le vol de la Marseillaise* (1922). See G. Haraszte, *Edmond Rostand* (1913); J. Suberville, *Le Théâtre d'Edmond Rostand* (1919).

**ROSYTH**, Scotland (see 14.718).—The development of the German navy in the first years of the 20th century rendered it necessary to create a British naval base suitable for a fleet concentrated in the North Sea, and in 1903 it was decided to establish a first-class naval base at Rosyth on the Firth of Forth. Land was acquired and works were planned, but the development of possibilities of torpedo attack soon made it evident that the outer anchorage, as originally designed, would be insecure, and naval opinion became doubtful as to whether the base would be adequate. The plans of construction were, therefore, modified in 1908, but, up to the outbreak of war in 1914, Rosyth was regarded as the principal base and headquarters for the Grand Fleet, though it was decided that initial stations must be established at Cromarty and Scapa Flow. When the World War began, Admiral Jellicoe preferred to establish his headquarters at Scapa Flow, but Rosyth was used as a secondary base, particularly for the battle cruisers.

The original scheme included a high-level main basin covering an area of 55 ac., with an entrance lock from the fairway, a dry or graving dock 750 ft. long and 110 ft. wide, a submarine tidal basin, the construction of an entrance channel, and the erection of workshops and offices, and work was begun in 1909. The whole site of the works was reclaimed from the sea, and a great sea-wall was built to form the southern boundary of the docks, the number of which was increased from one to three. Great progress had been made by the outbreak of war, and it was anticipated that the works would be completed by the summer of 1916. Operations were pushed on vigorously during the War, and a special Act of Parliament was passed in 1915 to facilitate the provision of dwelling houses for Admiralty employees. By the original Act for the construction of the base, the whole area between the town of Dunfermline and the land purchased by the government was brought within the municipal area, which was thus extended from 2,016 to 7,730 acres. It was decided in 1925 to reduce the dockyard to the basis of a "care and maintenance" establishment.

**ROTHERMERE, HAROLD SIDNEY HARMSWORTH**, 1ST VIC-COUNT (1868- ), British newspaper proprietor, was the second son of Alfred Harmsworth, and brother of Viscount Northcliffe. He was born April 26 1868 at Hampstead, London, was created a baronet in 1910, Baron Rothermere in 1914 and Viscount Rothermere of Hemsted, after his services as Air Minister, in 1918. He married in 1893 Mary Lilian, daughter of George Wade Share.

At the age of 21 he entered the publishing firm of which his brother, Alfred, was the principal, soon after the date when *Answers* was launched. He assisted in developing the business on sound and economic lines, and for the next 20 years was the close associate of his brother in all his great undertakings. He took an important part in the reorganisation of *The Evening News*, London, was one of the three principals in the establishment of *The Daily Mail* (1896), and was largely responsible for developing its methods of distribution. He founded *The Daily Record* (1895), bought *The Leeds Mercury*, and shared in the purchase of *The Times* (1908). He became known also as a most generous benefactor of charities. By the gift of a large sum he enabled the Union Jack Club to provide worthy accommodation for sailors and soldiers in London; and he gave £10,000 to the Territorial Force County of London Association. In 1910 he founded the King Edward Chair of English literature at Cambridge, and in 1910 he ceased his connection with *The Times*, *The Daily Mail* and *The Evening News*. In 1914 he acquired *The Daily Mirror* from Lord Northcliffe and in 1915 he founded *The Sunday Pictorial*, the first fully illustrated Sunday newspaper in London.

On the death of his brother, Lord Northcliffe, in Aug. 1922, Lord Rothermere by purchase acquired control of *The Daily Mail* and Associated Newspapers Ltd., the company which owns that newspaper among others; and subsequently bought large newspaper properties owned by Messrs. E. Hulton & Co., Ltd. Under

his supervision *The Daily Mail* greatly increased its circulation and continued to prosper. It maintained complete political independence and conducted a continuous and determined campaign for the reduction of national and local expenditure. His trenchant pamphlet *Solvency or Downfall*, published in 1921, attracted great attention. He has always opposed dangerous distant commitments such as the British mandate in Mesopotamia.

In the World War, Mr. Lloyd George, while Secretary for War, appointed Lord Rothermere in 1916 Director-General of the Royal Army Clothing Department. In the following year he accepted the office of Air Minister, under Mr. Lloyd George as Premier. He at once declared himself "whole-heartedly in favour of reprisals," which were the best means of carrying the War into Germany and protecting British towns against air attacks. Suffering from precarious health and his bereavements in the War, he resigned on April 25 1918, after he had carried out the fusion of the Royal Air Force and Royal Flying Corps. "My second tragic loss in the War, 10 weeks since," he wrote to the Prime Minister, "caused me great distress of mind and body . . . I was suffering from ill-health and insomnia."

The tragic losses to which he referred were those of his two sons, Capt. Harold Alfred Vyvyan St. George Harmsworth, M.C. (1894-1918) and Lieut. Vere Sidney Tudor Harmsworth (1895-1916). In memory of Harold, killed in Bourlon Wood Feb. 22 1918, Lord Rothermere founded and endowed the Harold Vyvyan Harmsworth Chair of American history at Oxford in June 1920. In memory of Vere, killed at Beaucourt Nov. 13 1916, Lord Rothermere in 1919 established and endowed the Chair of naval history at Cambridge which bears his name.

Lord Rothermere's third and only surviving son, Esmond Cecil (born May 26 1898), who had served during the last part of the War in the Royal Marine Artillery, was in 1919 elected M.P. for Thanet and was then the youngest member of the House of Commons and the fifth of his family to have a seat in one or other of the Houses of Parliament. (H. W. W.)

**ROTOR SHIP.**—Wind propulsion for navigational purposes, in the commonly accepted sense, although suited for some particular trades, is practically obsolete for cargo carrying; and the sailing ship, pure and simple, cannot be said to have a definite future. Many sailing vessels are fitted with auxiliary propelling machinery, but, excluding fishing craft, these vessels have not proved an unqualified success.

Herr Anton Flettner, the inventor of the rotor ship, originally intended to construct ships with metal sails, being convinced that the effect of metal sails is much greater than that of canvas sails. The idea was to build the metal sails with sections similar to those used in the construction of aircraft planes. It was intended that the sails should revolve freely around a pivot mast, and then be put by a special rudder blade in such a position that the wind would drive the ship ahead.

**Metal Sails.**—Experiments were carried out at the University of Goettingen with canvas sails, metal sails and model ships. The result of these experiments showed that the effect of metal sails could be made approximately double that of canvas sails, a necessary condition being, however, that a third part of the sail area should be turnable. Designs were got out, but the plans did not materialise.

In the case of the rotor ship the inventor states that it is not intended to drive ships solely by wind rotors, but that they shall serve as an auxiliary power upon steam and motor vessels. In the vessel under discussion, the power of the wind is not made use of by sails, but by means of large metal cylinders. The ordinary elementary laws of physics do not fully explain the problem of the rotor ship's cylinders; the modern science of currents dealing with liquid and gaseous bodies in their relation to hard bodies must also be considered.

**Revolving Cylinders.**—In 1922 experiments were carried out at Goettingen with revolving cylinders, and it was then discovered that the pressure exerted upon a cylinder revolving in an air current was considerably greater than had been supposed. Actually, the power exerted on a normal cylinder was about 4-5 times as large as that on a normal sail. When, however, disks of a

larger diameter were provided at the ends of the cylinders, it was found possible to increase the effect to nine or ten times the amount of wind effect in the normal sail. One condition for this, however, is that the revolving speed of the cylinders is about 3 to 4½ times as great as that of the wind. An ordinary sailing vessel requires to take down all her canvas in a hurricane, but the rotor ship could continue sailing, with more stability for manoeuvring. The danger from sudden squalls is not so great, as an increase of the wind speed has no influence, providing the circumferential speed of the towers is increased at the same time.

**Equipment of the "Buckau."**—The vessel selected for the first tests was the three-masted schooner "Buckau." She had a displacement of 960 tons, and was fitted with an auxiliary motor of some 200 horsepower. The canvas rig of the vessel was dismantled, and in place of the fore and third masts, two very strong masts were erected. The new masts were shorter, being 42 ft. in height. These masts were provided with bearings at the upper and lower ends to allow for the free rotation of the cylinders, which were placed over the masts. The cylinders were fitted with disks at either end, the disks being of greater diameter than the cylinders, but built as a part of them. In this particular case the cylinders are of sheet steel of 0.04 in. thickness.

Naturally, the whole structure is suitably stiffened. The cylinders are rotated by means of electromotors, which will give the towers a speed of 125 revolutions per minute. Circumferential speed is approximately 60 ft. per sec., and the power required to rotate the towers is nine horsepower. For working the plant one man only at the switchboard is required. By altering the circumferential speed of one or other of the cylinders the operator can correspondingly change the pressure exerted by the wind upon this, and so alter the vessel's course. When cruising, changing the wind side can be effected solely by the towers, when the ship can be stopped and driven astern; this method being far superior to that of the ordinary sailing ship.

**The Magnus-effect.**—The explanation of the phenomenon of the rotor ship may be traced to the so-called *Magnus-effect*, explained by Prof. Magnus of Berlin in 1853; who found that a special power is exerted by an air current upon a revolving cylinder. The explanation of the reason for this effect was found, after more than 20 years of investigation, to be briefly as follows. When a cylinder revolves, the nearest stratum of air revolves with the cylinder, owing to the friction of the cylinder being much greater than the friction of the air molecules against each other. The nearest stratum induces the next one also to revolve, but, naturally, this is done at a much slower speed. In the same manner the strata lying more distantly from the cylinder are moved more and more slowly, until at a certain distance the influence stops. If such a rotating cylinder is impinged upon by an air current, the speed of which is slower than the circumferential speed of the cylinder, the streamlines are directed, so that at one side the air is rarefied by the frictional effect of the cylinder, and at the other side it is compressed. These changes of pressure are the causes of the *Magnus-effect*, and they create a power in a direction away from the side of the rarefied air, and through the centre of the densest air patch, or side in which the stream lines are compressed. Actually the real direction of the power is not always at right angles to the wind direction, but diverges in a measure, which is dependent on the speed ratio of the wind current to that of the circumferential speed of the cylinder.

**Commercial Aspects and Value.**—As with every new invention, the advent of the rotor ship was hailed, obviously by non-technical writers, as a revolutionary step as regards ship propulsion, and many absurd and impossible claims were made regarding the capabilities of such a vessel. Coal and oil for marine purposes were said to be doomed, and a new era opening up as regards sea and ocean transport. Up to a certain point, the claims made by the inventor are justified; but the scope of the ship is very restricted, owing to the narrow limits imposed by the dependence on air currents. There may possibly be a field for such an invention as an auxiliary fitting to steam or motor vessels, and also when applied to tramp ships now dependent on the trade winds,

and in this connection the towers may to a certain extent supersede sails; but it is a very far cry to state that revolving towers will be the motive power of the future for all sea transport. It is possible also that the invention will be useful when it is applied to windmills for stationary use—in generating stations, for example.

*The "Buckau's" Trial.*—The sea-going trial of the rotor ship "Buckau," from Germany to the Forth, was claimed to be successful. It is, however, obviously impossible to give an unbiased opinion as to the ultimate value of the rotor ship until very full details are to hand regarding the capabilities of the vessel under all the varying conditions which obtain at sea. At present, Germany, apparently, is the only country to which the rotor ship has made an appeal, and rotor ships are under construction in that country. It is not considered that this method of marine propulsion will find favour with British shipbuilders.

*See Marine Engineer Officers' Magazine* (Jan. 1925). (F. J. D.)

**ROTTERDAM**, Holland (*see* 23.766), population 536,838 in 1923, has increased its port facilities and dock space since the World War, and is very largely used as a transit port, with a great number of river boats, though the general traffic has hardly reached pre-War level. In 1924, 10,085 vessels of 15,089,293 tons entered the harbour, as compared with 10,459 of 13,036,194 in 1913. A new quarter has sprung up on the left bank of the Maas, and the King's Bridge carries the road and railway across the harbour. Coolsingel has been made into a boulevard, and a fine town hall and general post office have been built; the old town hall is used as offices. In 1925 the municipality was faced with a heavy deficit, but the reviving trade of the port was expected to solve the difficulties of the city. The important coffee market is increasing its business, and the transit trade in iron ore is growing.

**ROUBAIX**, France (*see* 23.767), the chief centre, with Tourcoing, of the woollen industry of France, has regained prosperity after the calamities of the World War. The population was 113,265 in 1921, and a later estimate is 122,723. During the War the city was in the hands of the Germans. All stocks of wool and most of the machinery were removed, and factories were pillaged and the railway station was blown up before the retreat of the enemy; but, as the mills were largely spared, work was started again, with the help of government advances and bank credits, in 1919. In 1923 there were 71 combing, 61 spinning and 66 weaving establishments at work in Roubaix and Tourcoing. In 1925 large sums were being spent, both by the municipality and by manufacturers, in the provision of houses for workers since accommodation for them was very difficult to obtain.

**ROUEN**, France (*see* 23.768), with a population of 123,712 in 1921, has considerably increased its import trade since the World War. In 1923 the total amount of goods discharged (8,921,000 tons) exceeded the total of discharges and shipments at Marseilles, hitherto the first French port, but shipments at Rouen were small (345,000 tons). The equipment of the port has been much improved, but little progress had been made in 1925 with the larger undertakings, *i.e.*, the deepening of the harbour and provision of new quays and basins. A chapel (of Notre Dame de la Pitié) in the cathedral contains a French War Memorial, and in the chapel devoted to Ste. Jeanne is a plaque in memory of the British dead. There are cemeteries near the town, the first, with 15,500 British graves, being the largest in France. Part of the British Expeditionary Force disembarked at Rouen in Aug. 1914, and thereafter the town was a camp for reinforcements, and a large Army-Service Corps centre and contained several base hospitals. The archbishop's palace was the British headquarters.

**ROUSSEAU, VICTOR** (1865— ), Belgian sculptor, born at Feluy-Arquennes (Hainaut) Dec. 16 1865, became a member of the Belgian Royal Academy of Arts, director and professor of the Brussels City Academy, Commander of the Order of Leopold and holder of many Belgian and foreign orders. He began to exhibit about 1890, and his early works showed a lively understanding and a true native sense of technique. Gaining in repu-

tation rapidly, he was soon commissioned to execute works of importance. Rousseau's sculpture denotes both artistic insight and a sense of rhythm, and his art is peculiarly adapted to the translation of thought and emotion. His work is never specious, nor dependent on mere superficial beauty. Among Rousseau's principal works mention must be made of "Les Soeurs de l'illusion" and "Démeter" (both in the Brussels Museum), the decorative figures on the Fragnée Bridge at Liège, the "Maturnité" monument in the Place de la Chancellerie, Brussels, and the Max Waller memorial in the same city. M. Rousseau, who lived in London during the War, was commissioned to design the monument, signifying Belgian gratitude to England, which stands on the Thames Embankment, London, close to Cleopatra's Needle. He also designed the memorial at Forest, near Brussels, to those who fell in the War. (P. L.)

**ROUVIER, MAURICE** (1842–1911), French statesman (*see* 23.781), died at Neuilly-sur-Seine June 7 1911.

**ROWELL, NEWTON WESLEY** (1867— ), Canadian politician, was born Nov. 1 1867 in Middlesex county, Ontario. He was called to the Bar in 1891, and became head of the law firm of Rowell, Reid, Wood and Wright, Toronto. He stood unsuccessfully as a Liberal for the Dominion Parliament at the general election of 1900. In 1902 he became K.C. He was elected to the Ontario legislative assembly for North Oxford in 1911, and from that year to 1917 was leader of the Liberal Opposition in the Ontario Legislature. In Oct. 1917 he entered the Federal Govt. as president of the council and vice-chairman of the War Committee of the Cabinet, and was elected to the Dominion House of Commons for Durham county, Ontario, Dec. 1917. He was a member of the Imperial War Cabinet and Imperial War Conference, 1918; Canadian Govt. representative at the International Labour Conference at Washington, 1919; and a Canadian delegate to the first assembly of the League of Nations at Geneva, 1920, subsequently becoming vice-president of the League of Nations Society in Canada. He resigned his seat in Parliament in May 1921.

**ROWING.**—The period from 1910–25 did not exhibit the best class of rowing in any country of the world except in the United States, partly because the first of these years seemed almost universally to coincide with a curious deterioration both in style and in material, but chiefly because the World War had an effect which was far from being limited to the absence of all possible competitors in open events from Aug. 1914 until March 1919, and in some cases later still.

In England, both Oxford and Cambridge and the metropolitan clubs suffered losses even more terrible, proportionately, than those recorded in other forms of first-rate sport, and these losses not merely reduced the number of active oarsmen, but gravely lessened the opportunities of coaching new crews, owing to the casualties sustained. A third reason is to be found in the unavoidable fact that very few boys and young men were able to continue any practice in rowing at all while the War was in progress, and the races organised at Henley between various school crews were far from sufficient to give the competitors—when they survived—enough experience.

*The University Boat Race.*—The results of the Oxford and Cambridge eight-oared race from Putney to Mortlake ( $4\frac{1}{2}$  m.) have been as follows:—

|         |                                                  | Min. | Sec. |
|---------|--------------------------------------------------|------|------|
| 1910    | March 23 Oxford won by $3\frac{1}{2}$ lengths in | 20   | 14   |
| 1911    | April 1 Oxford                                   | 18   | 29   |
| 1912    | April 1 Oxford                                   | 22   | 5    |
| 1913    | March 13 Oxford                                  | 20   | 53   |
| 1914    | March 28 Cambridge                               | 20   | 23   |
| 1915–19 | No race.                                         |      |      |
| 1920    | March 27 Cambridge                               | 21   | 11   |
| 1921    | March 27 Cambridge                               | 19   | 45   |
| 1922    | April 1 Cambridge                                | 19   | 27   |
| 1923    | March 24 Oxford                                  | 20   | 54   |
| 1924    | April 5 Cambridge                                | 18   | 41   |
| 1925    | March 28 Cambridge finished alone                | 21   | 50   |
| 1926    | March 27 Cambridge won by 5 lengths in           | 19   | 29   |

In view of what has been said above, it is curious to note that both the record for this race (18 min. 29 sec. in 1911) and

the second best time (18 min. 41 sec. in 1924) have been achieved in the period immediately under review; but weather, wind and water have a very great effect on times in this long race at Putney, and the form shown in each case did not come up to that of earlier crews which were not so fortunate in their conditions. These factors also produced the catastrophe of 1925, when the Oxford boat shipped so much water at the start that it was only kept afloat for the next mile by the bladders under the seats, and the crew was obliged to land soon after passing Hammersmith, and Cambridge, who were considered good enough to win in any case, had to finish alone. In 1912 both boats were water-logged, and the Cambridge boat sank before reaching Hammersmith. They rowed again in two days' time and Oxford won.

The results of the Yale and Harvard University eight-oared race at New London, Connecticut (4 m.) have been as follows from 1910-25:—

| Date         | Won by   | Winner |      | Loser |      |
|--------------|----------|--------|------|-------|------|
|              |          | min.   | sec. | min.  | sec. |
| 1910 June 30 | Harvard  | 20     | 46½  | 21    | 04   |
| 1911 June 30 | Harvard  | 22     | 44   | 23    | 40½  |
| 1912 June 21 | Harvard  | 21     | 43½  | 22    | 04   |
| 1913 June 20 | Harvard  | 21     | 42½  | 22    | 20   |
| 1914 June 19 | Yale     | 21     | 16   | 21    | 16½  |

| 1926 June 25 | Yale     | 20     | 14½  | 20    | 21½  |

The record for the Thames river course was made in June 1916, by Harvard who did 20 min. 2 seconds. In June 1918, owing to the World War, the race was reduced to an informal two-mile contest at Derby, Connecticut. The full distance was introduced again in 1919. These races began over a two-mile course on Lake Winnepesaukee in 1852 when Harvard won. In 1855 the course became three miles at Springfield. Then, for nine years, it was rowed on Lake Quinsigamond, and in 1869 on Lake Saltonstall. The crews of 1876 and 1877 rowed four miles at Springfield, Massachusetts. In 1878 the four-mile course at New London, Conn., was inaugurated.

*Racing at Henley.*—For many years the blue ribbon of the rowing world for open competition in eights has been the Grand Challenge Cup at Henley Regatta, and one of the finest crews which ever won it was that of the Harvard Athletic Assn., from Boston, in 1914. Even the institution of the Olympic Games and the Olympic Regattas of 1908, 1912, 1920 and 1924 have not sensibly diminished the value, in public estimation, of the Henley Grand Challenge Cup, which, since its foundation in 1839, has been won by crews from abroad only in the case of New South Wales (1912) and Belgium (1906, 1907, 1909), in addition to the American crew already named.

The winners of the Grand Challenge Cup (distance 1 m. 550 yd., record 6 min. 53 sec.) since 1910 are the following:—

|                                   | Min. | Sec. |
|-----------------------------------|------|------|
| 1910 Magdalen College, Oxford     | 7    | 19   |
| 1911 Magdalen College, Oxford     | 7    | 2    |
| 1912 Sydney R. C. New South Wales | 7    | 6    |
| 1913 Leander Club                 | 7    | 11   |
| 1914 Harvard Athletic Assn.       | 7    | 20   |
| 1920 Magdalen College, Oxford     | 7    | 24   |
| 1921 Magdalen College, Oxford     | 6    | 54   |
| 1922 Leander Club                 | 7    | 36   |
| 1923 Thames R. C.                 | 6    | 45   |
| 1924 Leander Club                 | 8    | 3    |
| 1925 Leander Club                 | 6    | 53   |
| 1926 Leander Club                 | 6    | 56   |

With regard to these races it should be noted that the race of 1922 was rowed in a storm of wind and rain which must have added nearly 45 sec. to the time. In 1923 a short and perfectly straight course was tried as an experiment. From 1924 onward this straight course was made 1 m. and 550 yd., or exactly the

same as the distance in all former races except that of 1923. This course is marked out by piles with long booms which float on the surface of the water. It is now a straight course and the crews row up the centre of the river so that neither get shelter from the bank. This improvement was carried out by the Henley Regatta Committee and the Thames Conservancy.

In the United States there is an inter-university eight-oared race in which five or more eights compete simultaneously over a 4 m. course at Poughkeepsie. The following have been the results since 1912:—

| Year |         | Winner               | Second                    | Third               |
|------|---------|----------------------|---------------------------|---------------------|
| 1912 | June 29 | Cornell<br>19 21½    | Wisconsin<br>19 25        | Columbia<br>19 41½  |
| 1913 | June 21 | Syracuse<br>19 28½   | Cornell<br>19 31          | Washington<br>19 33 |
| 1914 | June 26 | Columbia<br>19 37½   | Pennsylvania<br>19 41     | Cornell<br>19 44½   |
| 1915 | June 28 | Cornell<br>19 36½    | Leland Stanford<br>20 37½ | Syracuse<br>20 43½  |
| 1916 | June 17 | Syracuse<br>20 15½   | Cornell<br>20 22½         | Columbia<br>20 41½  |
| 1920 | June 19 | Syracuse<br>11 02½   | Cornell<br>11 08½         | Columbia<br>11 21½  |
| 1921 | June 22 | Navy<br>14 07        | California<br>14 22       | Cornell<br>14 22½   |
| 1922 | June 26 | Navy<br>13 33½       | Washington<br>13 36½      | Syracuse<br>13 38½  |
| 1923 | June 28 | Washington<br>14 03½ | Navy<br>14 07½            | Columbia<br>14 15½  |
| 1924 | June 17 | Washington<br>15 02  | Wisconsin<br>15 09½       | Cornell<br>15 15½   |
| 1925 | June 22 | Navy<br>19 24½       | Washington<br>19 28½      | Wisconsin<br>19 58  |
| 1926 | June 28 | Washington<br>19 28½ | Navy<br>19 29½            | Syracuse<br>19 53½  |

In 1920 the race was only 2 m. on Cayuga Lake. The next three years were each 3 m. events. In 1924 the distance must have been about 3 m., and in 1925 there were seven crews competing, Columbia finishing last in 20 min. 15 seconds. Over the full 4 m. course the record of 18 min. 53½ sec., made by Cornell in 1901, still stands.

In the Olympic Regattas of 1908, 1912, 1920 and 1924 it will be sufficient to give the winners of the eights and of the single sculling race. The courses have been so different that a comparison of times would be valueless; but the distance is generally 1½ m. (as it was at Henley in 1908) or about 2 kilometres.

#### Eights

|                |                          |
|----------------|--------------------------|
| 1908 Henley    | Great Britain (Leander). |
| 1912 Stockholm | Great Britain (Leander). |
| 1920 Antwerp   | U. S. (Navy).            |
| 1924 Paris     | U. S. (Yale).            |

#### Sculling

|                |                                      |
|----------------|--------------------------------------|
| 1908 Henley    | H. T. Blackstaffe (Great Britain).   |
| 1912 Stockholm | W. D. Kinnear (Great Britain).       |
| 1920 Antwerp   | J. B. Kelly (United States America). |
| 1924 Paris     | J. Beresford Jr. (Great Britain).    |

For the professional sculling championship of the world (about 4 m.) the following races have taken place since 1910:—

|                                                                        | Min. | Sec. |
|------------------------------------------------------------------------|------|------|
| 1910 R. O. Arnst, beat G. Whelch in New Zealand                        | 21   | 50   |
| 1910 R. O. Arnst, beat E. Barry, on the Zambesi                        | 20   | 14   |
| 1911 R. O. Arnst, beat H. Pearce on Parramatta river                   | 19   | 40   |
| 1912 E. Barry, beat R. Arnst, Putney to Mortlake                       | 23   | 8    |
| 1912 E. Barry, beat E. Durner, Putney to Mortlake                      | 22   | 31   |
| 1913 E. Barry, beat H. Pearce, Putney to Mortlake                      | 24   | 9    |
| 1914 E. Barry, beat J. Paddon, Putney to Mortlake                      | 24   | 28   |
| 1919 A. Felton, beat E. Barry, Putney to Mortlake                      | 25   | 40   |
| 1920 E. Barry, beat A. Felton on Parramatta river                      | 24   | 32   |
| 1921 R. O. Arnst, beat J. P. Hannan in New Zealand                     | 22   | 38   |
| 1922 D. A. Hadfield, beat R. Arnst in New Zealand                      | 19   | 46   |
| 1922 J. Paddon, beat D. A. Hadfield in New Zealand                     | ..   | ..   |
| 1923 J. Paddon, beat D. A. Hadfield in New South Wales                 | 19   | 19   |
| 1924 J. Paddon, beat A. Felton at Brisbane                             | ..   | ..   |
| 1924 J. Paddon, beat Major Goodsell in New South Wales                 | 17   | 7    |
| 1925 Major Goodsell, beat J. Paddon (3 m. 167 yd.) on Parramatta river | 22   | 50   |

In amateur sculling nothing has yet touched F. S. Kelly's record of 8 min. 10 sec. done in 1905 on the Henley course and hardly anyone has shown such perfect form. In 1913 the Diamond Sculls were won by C. McVilly of Tasmania, in 1914 by G. Sinigaglia of Italy, and in 1922 by W. M. Hoover of the Duluth B.C., Minnesota, U.S.A., who was beaten in 1925. His style was his own and broke nearly every known rule, but he practised it so persistently and sculled so hard that he was always a very difficult man to beat, and was certainly as fast as any American entry for this famous race since E. H. Ten Eyck of Worcester, U.S.A., won it in 1897. For a long while Columbia College was the only entrant from the United States of America that took a Henley prize across the Atlantic, and they won the Visitors' in 1878. This race is now reserved to English college crews for which it was originally intended.

*Styles Compared.*—The crews sent for the Grand Challenge Cup at Henley from Cornell, Yale, Harvard and Pennsylvania have almost invariably shown that in the United States there are as many styles of rowing as there are famous coaches; and though English coaches like Mr. R. C. Lehmann, Mr. G. Nickalls and others have occasionally coached American crews these differences have always persisted.<sup>1</sup> In England, on the other hand, it may be truthfully said that there is only one accepted and orthodox style, laid down by Dr. Warre of Eton, and carried on by such coaches as Dr. Gilbert Bourne and Mr. Harcourt Gold. All first-rate crews aim at this, and the differences between them may be measured by their respective nearness to a common ideal.

*Boats for Rowing.*—On both sides of the Atlantic considerable progress in the theory of boat building has been made. The Belgian plan of building their boats in sections for convenience of transport revolutionised certain fixed ideas as to weight. The experiments of Dr. Warre in building a boat only 56 ft. long were also most fruitful; but though she proved faster than usual for a first-rate crew (and certainly won a university race on her merits in a storm), she was also slower than usual for a second-rate crew; and, since the absolute best can never be anticipated with complete certainty, Dr. Warre's model never became popular. Sir William Christie, formerly astronomer royal, designed a boat based on the involute of the circle in such a way that professional boat builders could make their own templates by quite simple methods on purely mathematical principles. Finally Dr. Bourne, combining first-rate experience with high technical acquirements, designed several boats on the streamline principle exhibited in certain fishes, and made a step forward of which the full results have not yet been realised.

*Rowing in Other Lands.*—France, one of the earliest nations, after the United States, to compete at Henley, does not seem to have contributed much to the technique of oarsmanship as yet, but Holland, which now seems to be following successfully in Belgium's footsteps, is making rapid strides both in style and technique. Italy is also sending crews to English regattas. Sweden and Norway, each devoted to what is known as the English style, have also made very great advances. Germany, whose four (the heaviest yet seen at Henley) was only just beaten in 1914, does not seem to have made that contribution to the theory of boat building which might have been expected from her industry and science. Both Canada and Australia sent very fine crews to England in the 20th century, and their winners are to be found in the lists both of the Grand Challenge Eights and of the Stewards' Fours.

*Oars and Other Accessories.*—Dr. Warre's style has hitherto been exemplified at its best with fixed rowlocks. But several English crews, and nearly all those of other nations, use the swivel rowlocks which are of course universal in single sculling. The English slide is usually 16 in. long and the oarsman slides right up to his work. But a few English crews and many American and other eights use slides without stops at either end. Not much difference is observable in oars, which are largely influenced

by style and rig. Some favour short ones of 12 ft. or less with 6 in. blades, such as the Belgians and most American crews prefer. Others use oars of 12 ft. 3 in. to 12 ft. 5 in. with 4½ in. blades, preferring length of stride to rapidity of action. The choice can only be decided by the coach of each particular crew.

In 1925 the Oxford University Press published a *Text-Book on Oarsmanship* by Dr. G. C. Bourne, which is the most complete treatise on the whole subject which has yet been issued. (D.)

**ROYCE, JOSIAH** (1855–1916), American philosopher, was born at Grass Valley, Cal., Nov. 20 1855. He graduated from the University of California in 1875 and in 1876 went to Johns Hopkins University as a fellow. After receiving his Ph.D. in 1878 he was instructor in English literature and logic at the University of California. In 1882 he was appointed instructor in philosophy at Harvard, where, after holding various intermediate posts, he became Alford professor of religion, moral philosophy and civil polity in 1914. He was the leading American exponent of idealism (see 14.284) and his works were distinguished for their literary qualities. He died at Cambridge, Mass., Sept. 14 1916.

Royce was the author of *A Primer of Logical Analysis* (1881); *The Religious Aspects of Philosophy* (1885); *The Feud of Oakfield Creek* (1887, a novel); *The Spirit of Modern Philosophy* (1892); *The Conception of God* (1895); *Studies of Good and Evil* (1898); *The World and the Individual*, 2 vol. (1900–1), Gifford Lectures at the University of Aberdeen; *The Conception of Immortality* (1900); *Outlines of Psychology* (1903); *Herbert Spencer: An Estimate and Review* (1904); *The Philosophy of Loyalty* (1908); *Race Questions, Provincialism and Other American Problems* (1908); *William James and Other Essays on the Philosophy of Life* (1911); *Bross Lectures on the Sources of Religious Insight* (1912); *The Problem of Christianity*, 2 vol. (1913), lectures before Manchester College, Oxford; *War and Insurance* (1914); *The Hope of the Great Community* (1916), war addresses; and the posthumously published *Lectures on Modern Idealism* (1919).

**ROYDEN, AGNES MAUDE** (1876– ), British social worker and preacher, youngest daughter of Sir Thomas Royden, 1st Bart. of Frankby Hall, Cheshire, was educated at Cheltenham and Lady Margaret Hall, Oxford. After leaving Oxford she was for several years engaged in social work, first in Liverpool and later in the country parish of Luffenham, Rutland. In 1908 she became an active member of the constitutional wing of the women's suffrage movement and until 1914 edited *The Common Cause*, the organ of the National Union of Women's Suffrage Societies. The reputation she achieved as a thoughtful and incisive speaker and writer on contemporary religious and social problems brought her in 1917 an invitation to become assistant preacher at the City Temple, London, which she accepted, and thus became the first woman in Great Britain to occupy the pulpit of a regular place of worship. On relinquishing her appointment at the City Temple she founded in conjunction with Dr. Percy Dearmer, the Fellowship Services conducted first at the town hall, Kensington, London and afterwards at the Guild House, Eccleston Square.

Miss Royden's numerous books and pamphlets include *Women and the Sovereign State* (1917); *Sex and Commonsense* (1922); *Prayer as a Force* (1922); *Political Christianity* (1922); and *The Church and Woman* (1924); and she has written copiously for the Press.

**RUANDA-URUNDI** is a mandated territory in East Africa lying between the first and fourth degrees of south latitude and 29° to 31° east longitude. It is bounded on the north by Uganda, on the east and south by Tanganyika territory, and on the west by the Belgian Congo. It comprises that portion of the former German colony of East Africa which was assigned under Mandate to Belgium after the World War, and covers an area of about 22,000 sq. miles.

The country was occupied by Belgian troops from the Congo in 1916, and in 1920 the frontier between the two Mandates was laid down by what was known as the Orts-Milner boundary. By this delimitation, the Kisaka district, a considerable area along the valley of the Kagera river, was detached from the territory claimed by King Musinga of Ruanda, in order to preserve a line of access for a future British railway to connect Uganda with the central railway of Tanganyika. This reservation deprived the people of Ruanda of some of their most essential grazing lands, and created much consternation among them. At the instance

<sup>1</sup> The various American styles are all founded on the English style, the chief difference in America being a longer slide, a harder leg drive and less body swing. (ED. E.B.)

of the Mandates Commission, the British Govt. consented in 1924 to the readjustment of the frontier, and the Kagera river now forms the greater part of the boundary. There was much delay in issuing the Mandate—for which the concurrence of the United States had to be obtained—and this was further prolonged by the readjustment of the frontier. It was not therefore until Oct. 1924, that the Mandate was formally accepted by the Belgian Parliament. A law was then passed by which the territory should be administered as an integral part of the Congo but with a separate budget.

The pacification of Urundi, which under German rule had been disorganised by internal warfare, was completed in 1921, and reports, inclusive of that year, have been regularly submitted to the Mandates Commission under the draft Mandate, and examined in the presence of an accredited representative.

The country is divided into two distinct units—Ruanda under the despotic King Musinga, and Urundi under a council of regency during the minority of the Chief. Each is supervised by a resident with headquarters at Kigali and Kiteja respectively, the capital being at Usumbura on Tanganyika lake. It is the declared policy of Belgium to support the authority of the native chiefs and to rule through them. There are about 70 European officials.

The greater part of the country is mountainous and lies at a high altitude. Lakes Tanganyika and Kivu form part of its frontiers and there are numerous other small lakes—one, Karago, at an altitude of 6,000 feet. The population is estimated at 5,000,000, the density in some areas being upwards of 300 to the sq. mile. The bulk of the people are of Bantu stock, but the ruling caste are of the pastoral Wahima race, as in Uganda, Unyoro and Ankoli. The wealth of the country consists in its flocks and herds.

The local revenue is about 4,500,000 fr., of which half is derived from a direct tax on the natives. It is supplemented by a grant of 1,400,000 francs from Belgium. Owing to its distance from the sea and the lack of cheap transport, the trade of the country is at present small. A quantity of foodstuffs with livestock and hides is exported (see MANDATES). (F. D. L.)

**RUBBER** (see 23,795).—The area devoted to growing rubber trees was in 1924 computed to be as follows, about 75% producing:—

|                 | Planted Ac. | In bearing | % of total |
|-----------------|-------------|------------|------------|
| Malaya          | 2,230,000   | 1,672,500  | 56.8       |
| Ceylon          | 410,000     | 307,500    | 10.5       |
| India           | 127,000     | 95,250     | 3.2        |
| Dutch Indies    | 1,000,000   | 750,000    | 24.4       |
| Other districts | 160,000     | 120,000    | 5.1        |
|                 | 3,927,000   | 2,945,250  |            |

The following table shows the world's rubber production from 1920-5:—

|      | Plantation Acreage     | Plantation Production (tons) | Total Wild Rubber Production (tons) | Total World's Production (tons) |
|------|------------------------|------------------------------|-------------------------------------|---------------------------------|
| 1920 | 3,200,000              | 304,671                      | 36,464                              | 341,135                         |
| 1921 | 3,321,000              | 276,746                      | 23,903                              | 300,649                         |
| 1922 | 3,475,000              | 378,232                      | 27,878                              | 406,110                         |
| 1923 | 3,915,000              | 379,738                      | 26,685 <sup>1</sup>                 | 406,423 <sup>1</sup>            |
| 1924 | 4,266,000              | 386,703                      | 26,396                              | 413,099                         |
| 1925 | 4,296,000 <sup>1</sup> | 470,000 <sup>1</sup>         | 35,000 <sup>1</sup>                 | 505,000 <sup>1</sup>            |

<sup>1</sup> Estimated.

## I. VARIETIES OF COMMERCIAL RUBBER

**Price Range for Crude Rubber.**—Demand and supply, and, in a minor degree, speculation, occasioned a wide variation in the price of crude rubber: early in 1925 it was back to the average for 1913, but on July 20 1925 reached \$1.21, the price in Aug. 1914. The United States Department of Commerce gives the following as the average monthly price per lb. for spot rubber in New York for the years 1913-24 inclusive:—

| Year | \$   | year | \$   |
|------|------|------|------|
| 1913 | .807 | 1919 | .483 |
| 1914 | .616 | 1920 | .333 |
| 1915 | .557 | 1921 | .182 |
| 1916 | .669 | 1922 | .183 |
| 1917 | .648 | 1923 | .249 |
| 1918 | .549 | 1924 | .211 |

The following table shows the approximate world consumption in gross tons from 1920 to 1925:—

|                 | 1920    | 1921    | 1922    | 1923    | 1924    | 1925                 |
|-----------------|---------|---------|---------|---------|---------|----------------------|
| United States   | 252,922 | 185,394 | 301,076 | 309,139 | 324,500 | 384,837              |
| Great Britain   | 56,572  | 42,087  | 11,765  | 12,558  | 18,500  | 26,500               |
| Germany         | 13,400  | 22,428  | 27,551  | 19,436  | 22,738  | 28,263               |
| Austria         | 4,200   | 2,000   | 2,270   | 1,334   | 2,500   | 3,900                |
| Scandinavia     | 1,100   | 900     | 1,600   | 2,000   | 2,400   | 2,700                |
| France          | 16,606  | 14,701  | 27,660  | 31,108  | 34,442  | 39,000               |
| Japan           | 5,500   | 23,164  | 16,581  | 17,318  | 18,905  | 20,000               |
| Russia          | 140     | 200     | 2,100   | 3,900   | 2,000   | 4,000                |
| Belgium         |         |         |         |         |         |                      |
| Holland         | 3,500   | 1,800   | 1,200   | 1,880   | 2,200   | 3,100                |
| Canada          | 11,351  | 8,259   | 9,353   | 13,255  | 14,391  | 20,500               |
| Australia       | 800     | 900     | 1,700   | 2,400   | 2,900   | 3,300                |
| Italy           | 6,800   | 4,000   | 6,400   | 8,490   | 8,764   | 10,500               |
| Other countries | 1,178   | 1,225   | 1,600   | 1,760   | 2,100   | 3,500                |
| World totals    | 374,069 | 307,058 | 410,856 | 424,578 | 456,340 | 550,100 <sup>1</sup> |

<sup>1</sup> Estimated.

**Stevenson Restriction Plan.**—To support the price of crude rubber a regulative measure, known as the Stevenson plan (after Sir James Stevenson, chairman of the committee appointed by the British Secretary of State for the Colonies) was, on the recommendation of the committee, adopted by British planting interests late in 1922. Prices were well below production costs (touching 11½ cents per lb. in 1921); so the Stevenson compulsory restriction plan was enacted into law by the legislatures of the Malay States, Straits Settlements and Ceylon, taking effect from Nov. 1 1922. It established as standard production the quantity of dry rubber produced from any holding during the period Nov. 1 1919 to Oct. 31 1920, plus an allowance, if claimed, for untapped trees. The total standard production was estimated at 330,000 tons. Provision was made for a minimum export duty to be levied on that percentage of standard production which producers would be allowed to export under the scheme at the minimum rate of duty, which was not to exceed 1d. per pound. If a producer wished to export more than that allowed at a minimum rate of duty, he would be required to pay an export duty per lb. on his total export during twelve months on the following scale:—

|               |                            |      |
|---------------|----------------------------|------|
| Not exceeding | 65% of standard production | 4d.  |
| Over          | 65% but not exceeding 70%  | 5d.  |
| Over          | 70% but not exceeding 75%  | 6d.  |
| Over          | 75% but not exceeding 80%  | 7d.  |
| Over          | 80% but not exceeding 85%  | 8d.  |
| Over          | 85% but not exceeding 90%  | 9d.  |
| Over          | 90% but not exceeding 95%  | 10d. |
| Over          | 95% but not exceeding 100% | 11d. |
| Over          | 100%                       | 12d. |

At the outset the percentage of rubber exportable was set at 60, based on standard production: but the plan provided also for alteration in the percentage, on the basis of the price of standard quality smoked sheet in the London market: when the average price during three consecutive months had been maintained at not less than 15d. per lb. London landed terms, the exportable allowance would be raised automatically by 5% for the next quarter: should the average price be maintained at not less than 18d. for the three consecutive months the percentage would be raised by 10% for the ensuing quarter: and so on until the point of maximum or full standard production be reached. If, however, during any three consecutive months the price had not averaged at least 12d. per lb. the exportable allowance would be reduced to 55%, and so on by reductions of 5% at the end of each three months until, by control of export, the demand for rubber would bring its price back to the basic 15d. figure. Once lowered, the percentage would not be increased except on the basis of the 15d. price. The standard production for Nov. and Dec. 1925 and Jan. 1926 was adjusted to 369,641 tons.

The table<sup>1</sup> on page 385 shows the percentage of standard production exportable at the minimum rate of duty during each quarter

<sup>1</sup> Reproduced from 17th Report of the Council to the members of the Rubber Growers' Association (Incorporated).

since the inception of the scheme in Nov. 1922, together with the average daily price for spot sheet in London during each quarter:—

| Quarter                 | %   | s. | Price<br>d. |
|-------------------------|-----|----|-------------|
| Nov. 1922 to Jan. 1923  | 60  | 1  | 2.285       |
| Feb. 1923 to April 1923 | 60  | 1  | 4.858       |
| May 1923 to July 1923   | 65  | 1  | 2.242       |
| Aug. 1923 to Oct. 1923  | 60  | 1  | 2.994       |
| Nov. 1923 to Jan. 1924  | 60  | 1  | 2.175       |
| Feb. 1924 to April 1924 | 60  | 1  | 0.917       |
| May 1924 to July 1924   | 60  | 1  | 10.974      |
| Aug. 1924 to Oct. 1924  | 55  | 1  | 2.632       |
| Nov. 1924 to Jan. 1925  | 50  | 1  | 5.998       |
| Feb. 1925 to April 1925 | 55  | 1  | 7.356       |
| May 1925 to July 1925   | 65  | 3  | 2.469       |
| Aug. 1925 to Oct. 1925  | 75  | 3  | 7.269       |
| Nov. 1925 to Jan. 1926  | 85  | 3  | 10.709      |
| Feb. 1926 to April 1926 | 100 |    |             |

The export quota remained at 100% for the quarter May-July 1926.

**Reclaimed Rubber.**—In few other industries is conservation such an important factor as in rubber manufacture. Worn-out vulcanised rubber goods are collected and the basic material recovered to be manufactured again into new articles. So many uses have been found for reclaimed rubber that in 1925 its consumption approached that of the crude product. The element of cost has been an important factor in popularising reclaimed rubber, as articles made of it could be produced and sold for much less than those made with new rubber only: and to a considerable degree the price of the crude product has been kept down by the ample supply of the reclaimed. To meet the growing demand, large companies have supplanted the small reclaimers: such concerns employ not only the most modern machinery, but maintain research and analytic laboratories for control of processes, standardising products, and for the study of reclaiming and compounding problems.

The first attempt to reclaim rubber commercially was made in the early 'fifties of the 19th century when Hiram L. Hall, a manufacturer in Massachusetts, boiled and steamed powdered vulcanised rubber and then sheeted it. An important later development was the destruction of fibre in the ground material by means of acids, chiefly sulphuric, for which processes over 50 patents were granted. The acid process was of use chiefly in the reclaiming of worn-out footwear, but was not of great value in recovering other waste. The alkali process, invented by Arthur Hudson Marks, a manufacturer in the United States, solved the latter problem. In this, caustic soda was used to destroy fabric and incidentally it proved to be the most effective agent in de-sulphurising the mass.

The removal of not only the free sulphur from vulcanised rubber (which modern reclaiming accomplishes) but also of the sulphur which during curing unites chemically with the crude rubber, is the goal towards which experimenters have been striving. Notable progress in this direction was made in England by Dr. David Spence, who used an accelerator, aniline-potassium, but in solution in excess of aniline. He claimed not only the dissolution of the waste rubber but the liberation in soft rubber of from 78% to 90% of the combined sulphur, and the changing of the latter into an insoluble alkaline sulphide. In hard rubber 73% of the combined sulphur was said to be similarly reduced. There are also many processes of a secret nature, most of which tend to the production of higher grades of reclaimed rubber.

The gathering of worn-out or damaged rubber goods, called scrap rubber, is a highly organised business, particularly in the United States. From the junk men it passes into the warehouses of the specialists in rubber waste, who sort and bale it and sell it to reclaimers. The standard grades are, boots and shoes, trimmed arctics, untrimmed arctics: hard rubber, battery jars; inner tubes: mechanical, black scrap, heels, horseshoe pads; hose; red scrap, white scrap: auto tires, bicycle tires, solid tires. The reclaiming factories convert the scrap into reclaimed rubber which they sell to manufacturers of rubber goods. The existing grades of reclaim run into hundreds, but the standard grades

are: floating; friction; mechanical; shoe, unwashed; tires, auto; tires, truck; white. With crude rubber at 60 cents per lb. scrap varies from 2 to 8 cents, and reclaim from 8 to 20 cents.

**Synthetic Rubber.**—Many attempts have been made to produce synthetic rubber, and success has attended these efforts, but the production of commercial rubber synthetically had not been achieved by the beginning of 1926. In the making of synthetic rubber the chief concern of the chemists has been the solution of the following problems: (1) the production of isoprene, an oily, volatile hydrocarbon ( $C_5H_8$ ), and hemiterpene, with its analogous hydrocarbons, such as butadiene or methyl-isoprene and dimethyl-butadiene; (2) the polymerisation of these products

FIG. 1.—During the period 1910-25 both the production and consumption of rubber greatly increased. This chart is based on figures supplied by the Rubber Growers' Association (London). The outstanding features, as shown by the chart, are the great increase in the production of plantation rubber, mainly from British Malaya, Ceylon and the Netherlands East Indies, and the decrease in the output of wild rubber. It is also interesting to note that from 1923 to 1925 consumption outstripped production.

into caoutchouc ( $C_{10}H_{16}$ ); and (3) the grouping of such fundamental caoutchouc molecules into an aggregate having the dimensions, arrangement and properties of the complex molecule of natural rubber bearing the formula  $(C_{10}H_{16})_n$ .

Isoprene was obtained first by F. C. Himley in 1835, and was noted by Apollinaire Bouchardat in 1837. In 1860 it was properly characterised by Greville Williams, who isolated it and caoutchene through dry distillation of rubber and rectification with sodium. Gustave Bouchardat, in 1879, produced caoutchene, a polymer of isoprene, by treating the latter with hydrochloric acid, obtaining a substance seemingly identical with rubber. Sir William Tilden, in 1882, also converted isoprene with hydrochloric acid into a tough, elastic solid, and noted that isoprene could be changed spontaneously into rubber. In 1884 he produced isoprene by passing turpentine through a hot tube. In the same year he suggested that not only isoprene but its homologues, butadiene and others, should be as readily polymerised. In 1892 he proved that polymerised isoprene could be vulcanised with sulphur. In 1887 Prof. Otto Wallach of the University of Göttingen, polymerised isoprene into caoutchene ( $C_{10}H_{16}$ ) at 260° Centigrade.

Prof. Wilhelm Euler of the University of Stockholm, in 1897, synthesised and polymerised isoprene. A. Heinmann, in 1908, suggested the production of isoprene from methylthiophene, which could be produced from starch hydrolysed, oxidised and treated with phosphorous trisulphide. Drs. Fritz Hofman and Carl Coutelle, in 1909, produced pure isoprene, which, on being heated in a closed tube, with other substances, gave a product pronounced pure rubber by Prof. C. D. Harries, of Kiel Univer-

sity. Prof. Harries, who had, in 1905, determined the chemical constitution of natural rubber, in 1910 produced its counterpart by heating isoprene in a closed tube with glacial acetic acid. Starting with commercial alcohol, he worked out a process for producing a material yielding from 60 to 75% of pure isoprene. Prof. Harries and the English investigators, F. E. Matthews and E. Halford Strange, noted independently that sodium greatly quickened isoprene's polymerisation and gave a better product; and German chemists noted other important results of polymerisation in carbonic acid. A German process used ozonisers as catalysts with sodium hydroxide.

The polymerisation of butadiene with sodium has since been effected in three hours, it is stated, with the temperature held between 40 and 50° Centigrade. J. Plotnikow, in 1922, found that ultra-violet rays polymerised vinyl chloride (an acetylene derivative) to caoutchouc chloride, which could be readily turned to rubber. He obtained a similar product and simulated plant photosynthesis by adding a uranium salt to the vinyl chloride and exposing it only to sunlight. Some of the synthetic rubbers are elastic, soluble, and may be readily vulcanised, but they lack the durability, tensile strength, and other qualities of the natural article, imparted to or conserved in the latter by certain resins, protective colloids, etc. A drawback in the manufacture of synthetic rubber is the formation of undesirable by-products which are difficult to remove.

*Mineral Rubber.*—This is a plastic, inelastic hydrocarbon, or asphaltic pitch, combined with harder bitumens, such as gilsonite, or the product obtained by blowing the still residues from asphalt and mixed base petroleum combined with gilsonite. Mineral rubber may be mixed with natural rubber up to a ratio of seven volumes of the former to 100 of the latter, with beneficial effect on the physical properties of the natural article. It is supplied in solid, liquid and powdered form.

*Artificial Rubber.*—A factitious rubber, known as factice (though often mis-called rubber substitute) which has physical resemblance and qualities akin to the natural product, artificial rubber comprises a class of material valued for compounding with true rubber, and in the preparation of which vulcanising accelerators may be used. Factice is made from vegetable (rarely animal) oils subjected to the action of metalloids like oxygen and sulphur, of certain chlorides like that of sulphur, and of acids of the nitric type, which under varying temperatures determine the qualities of the product.

Anderson in 1847 was the first to recognise the industrial value of "vulcanisable oils," as they were termed. Nicklès and Rochelard soon afterward noted that by mixing the oil-sulphur compounds with sulphur chloride a substance analogous to rubber could be produced; and Parkes, who discovered the cold-curing process, considered both reactions identical. Experiments by Roussin, Gaumont, Perra, Bruce and Warren led to improved technique in manufacture and extended commercial use. Drying oils like those of linseed, poppy and rape seed are preferred, but castor and some other non-drying oils also yield good factice. Sulphur products are brown; chloride of sulphur, whitish. To the former, resin oils, tars and asphalts are often added; and to the latter, chalk, talc and magnesia. To both kinds, waxes, vaseline and clear mineral oils are added to reduce density chiefly. Factice is insoluble in the usual rubber solvents, but yields to boiling, heavy naphtha, alcoholic soda and acid chlorides, and slightly to warm chloroform.

*Chemistry of Rubber.*—The caoutchouc molecule had long been known to contain 5 carbon and 8 hydrogen atoms, and had hence borne the formula  $C_5H_8$ . But rubber, unlike other hydrocarbons having a similar formula, gives proof of a molecular group formation, the number of such linked molecules being yet unknown, although estimated at 8 or 10. On account of its analogy to the terpenes it was later given the formula  $C_{10}H_{16}$ , termed a polyterpene, and the index  $n$  added, indicating an indeterminate molecular grouping. A question still disputed, too, is whether the molecule members form a cyclic or an open chain complex. A recent and plausible theory gives  $(C_5H_8)_n$  as the ultimate molecule of caoutchouc, in which 32 carbon atoms form a ring

compound. Rubber being of a colloidal nature is not soluble in a chemical sense. It can form only pseudo-solutions or "swellings" in the fluids known as rubber solvents. Investigators, hence, have been seriously handicapped through the lack of a solvent which could resolve the colloidal aggregation (Schidrowitz) into a true, *i.e.*, crystalloid, solution, and thus make possible the direct and final determination of the structure and weight of the caoutchouc molecule.

## II. THE MANUFACTURING SIDE

In all commercial rubber caoutchouc exists in two forms, one fibrous or hard, the other viscous and soft. The soft form can be easily dissolved: the fibrous form swells, but does not dissolve. Vulcanisation hardens the viscous portion, and the rubber becomes thus more durable and less sensitive to heat and cold and to the effect of acids and alkalis. A small amount of sulphur in rubber and moderate heat produces soft rubber, more sulphur and greater heat produces hard rubber. In manufacture india rubber is softened by heat until plastic, and calendered; or shaped for making up for vulcanisation; or it is put in naphtha solution, spread, shaped and made up for vulcanisation. It is never melted, as the result would be a worthless sticky semi-fluid.

From the time of Goodyear, rubber footwear was vulcanised by the dry heat cure; that is, in closed rooms filled with hot air. This was very slow, entailing some seven hours of heating. Furthermore, only rubber containing a considerable amount of litharge could be used for this type of cure. The colour was always black, and variety in compounding and stocks was impossible. The discovery of the pressure cure by Augustus O. Bourn, of Providence, Rhode Island, in 1901, however, practically revolutionised the business. In this process the goods were confined in large boiler-shaped shells. These were filled with hot air under pressure and the air from the inner surfaces removed by a vacuum process, the result being that vulcanisation was hastened and a great variety of tough compounds, as for example those used in tire treads, were made available.

In the period 1910-25 much progress was shown in such chemical discoveries as accelerators, and the mechanics of rubber manufacture were revolutionised. For many years rubber, after being cleaned by washing, was dried in airy lofts, often hanging for a year to "age." Hot dryers brought the drying period down to weeks and sometimes days. Eventually with the vacuum dryer a few hours sufficed to extract the moisture. More than 250 fillers and compounding materials are used in rubber manufacture. Their purpose is chiefly to enhance properties or supply certain qualities in which rubber may be lacking. For example, powdered asbestos in quantity makes a compound that is heat-resisting, as in packing and brake linings. Most of the above materials have been known for years. The successful use of organic plastics such as glue is recent, as is the preparation of elaterite in plastic form for rubber compounding.

*Direct Use of Latex.*—A notable improvement on the acid method of coagulating rubber latex is that of Ernest Hopkinson, by which rubber milk, blown in a mist into a hot compartment, is dehydrated and deposited quite pure in a snowy and velvety mass. By adding sulphur, fillers and accelerators, this may be applied directly to fabrics so as to produce complete "friction" at one operation. Another use for latex is in paper making. According to the process of Frederick Kaye, diluted latex added to pulp in the beater of a paper-making machine and thrown out on the fibre with a coagulant, yields a paper having a marked strength, vellum-like texture and improved folding, moisture and dielectric resistance.

The Wm. Beach Pratt process for de-coagulating crude rubber results in a water dispersion of rubber coagulum, similar to natural latex, which may be re-coagulated and vulcanised: and may be made not only of crude rubber but also of vulcanised and acid and alkali reclaimed rubber. The product mills easily, and eliminates solvent, fire and health hazards.

*Miscellaneous Soft Rubber Products.*—With the interest in pilot and dirigible balloons stimulated by the World War, came marked progress in rubber compounds used in their manufacture.

Of these the most notable were cements of vastly increased tenacity: ingredients and surface coatings that remain unaffected by the sun's rays; and compounds practically impermeable to inflating gases, such as the gas-proof masks evolved by rubber chemists, that effectually protected soldiers from poison gas and are widely used in many perilous industries. Bathing suits and bathing caps of rubber, beautiful in texture, colours and ornamentation, are recent accomplishments. This is due to the production by chemists of colours unaffected by heat and sulphur. An exceptional and novel use is rubber thread in golf-ball manufacture. The standard ball was for years made of solid gutta. In 1898 Coburn Haskell, of Cleveland, Ohio, invented a golf ball with a small ball of rubber as a core around which was wound rubber thread under tension. Outside of this was moulded a thin cover of gutta percha. The ball, because of its long flight, soon took the place of the "guttie" and helped enormously to popularise golf.

Flexible, transparent "rubber glass" has been produced by Fordyce Jones through precipitating rubber from a solution vulcanised by a dual-gas process and obtaining a plastic mass which can be pressed or moulded after the manner of glass. Much progress in the decade 1915 to 1925 has been made in the production of rubber pavements. Their successful use on bridges, not only as a preventative of noise but to remove vibration, promises well for the future. Rubber and fibre soles and soles of crêpe rubber have found a very large market. The rubber heel has also largely displaced leather in medium and high-grade footwear.

**Organic Accelerators in Vulcanisation.**—The most striking progress in the art of rubber manufacturing, second only to the discovery of vulcanisation, has been achieved through the efforts of chemists to reduce the time required for vulcanising, while enhancing the quality and properties of the products. For two-thirds of a century workers in rubber were content with litharge and a few other mineral substances as curing-quickeners. In the early 'nineties, in consequence of attempts to vulcanise synthetic rubber, the unique value of various synthetic organic chemicals (mostly coal tar derivatives and related to organic dyes) as curing accelerators was revealed by Dr. David Spence and others. As compared with white lead, as used by Goodyear in 1839 and mentioned in his patent of 1844, and formulas which required from 5 to 15%, less than 1% of an organic accelerator would suffice and give both quicker action and better results. Since then their use has fairly revolutionised compounding and vulcanising.

The first mention of a nitrogenous or organic material for quickening vulcanisation occurs in a patent granted in England in 1881 to T. Rowley for the use of ammonia vapour: but no commercial use of an organic accelerator was made until 1906, when in the United States a typical one, aniline oil, proved of practical value. The successful use of piperidine by Dr. David Spence was announced in England early in 1912. Later in this year, after patents had been granted for numerous German preparations of this kind, organic accelerators began to be employed on an extensive scale. Since the World War, however, American organic chemical products have to a large extent replaced those of German manufacture.

The earlier theories advanced to explain the action of organic accelerators assumed that nitrogen was an indispensable constituent, and for several years preference was shown to those containing aniline (amino-benzene) or allied compounds; but the later and successful use of sulphur-bearing compounds led to a different conclusion. A now widely held theory is that velocity of curing is effected by an accelerator which first adds sulphur to itself, forming an extremely active polysulphide, the "super-sulphur" of which is, as soon as formed, shed to the rubber, speedily vulcanising the latter even at low temperatures.

M. André Duboscq, an eminent French chemist, after experiments with hexamethylene-tetramine (the drug urotropin, one of the amino group) which, like thio-carbanilide, is still one of the most widely used of accelerators, concluded that cyanhydric acid was the "active principle" which Dr. Spence had tried to determine; and that its practical effect was the transformation of ordinary divalent sulphur into hexavalent sulphur which could

saturate three double bonds in the rubber molecule, while divalent sulphur would saturate but one bond in the same time. The theory is also applied to nitroso bodies, which during vulcanisation generate cyanic acid. The latter, reacting with sulphur, yields sulphurous anhydride and sulphocyanic acid; the latter dissociates and leaves hexavalent sulphur, and the liberated cyanhydric acid again functions as an accelerator.

Organic accelerators are commonly grouped into four classes: ultra rapid, rapid, moderate and slow. Of the first class, two groups are especially notable: *i.e.*, tetra-methyl-thiuram-disulphide, and the metallic salts of dithio-carbamic acid. The first is not only one of the most energetic cure-quickeners known, but is also a vulcanising agent. Using but 3% in a batch, with some zinc oxide as an activator, it will cure the rubber in 5 min. at 20 lb. of steam in the open, or in 10 min. at 60 lb. in a mould, either cure showing a tensile test of about 4,000 lb. per sq. inch. It is an oxidation product of dimethyl-amine and carbon disulphide, is non-poisonous, does not discolour fine stock, and delays ageing of the product.

The second group includes about 40 salts, largely substituted ammonium compounds, many of which are not only powerful cure-quickeners, but are also intense organic colouring substances. A typical accelerator of this group is piperidine penta-methylene-dithio-carbamate, which, with some zinc oxide, will vulcanise rubber in from 3 to 10 min. at 10 lb. of steam, or at room temperature in from 2 to 3 days. Organic accelerators with a wide range of uses and properties include para-nitroso-dimethyl-aniline, mercapto-benzothiasole, piperidonium-piperidyl-dithio-carbamate, di-o-tolyl-guanidine, diphenyl-guanidine, thiocarbanilide, hexamethylene-tetramine, alpha-phenyl-biguanide, quinodine, para-phenylene-diamene, aldehyde and furfural ammonia, hydroxy-quinoline, quinosol, alpha-naphthyl-amine, formaldehyde aniline, triphenyl-guanidine, anthra-quinone, antipyrine, the toluidines, the xylidines, putrescin, bone oil, etc.

**Vulcanisation.**—Vulcanisation, or curing, is effected generally by either the heat cure or the cold cure. In the first named method either steam or heated air is employed. A wide range of rubber goods, either in moulds wrapped with strips of cloth, or imbedded in French talc to preserve their shape, is very efficiently cured with live steam in various types of vulcanisers. For many other needs the dry-heat cure, in which the goods are placed in a hot compartment without either wrapping or mould protection, has been found serviceable. Still another heat cure, now but little used, is that of solar-vulcanisation, whereby fabrics, coated with a thin skin of rubber, are exposed to the sun's rays. In very exacting work, such as the vulcanising of hard-rubber sheets, curing is effected by immersion in hot water. In the cold cure either the acid or the vapour process is employed. In the former, goods are dipped in solution of chloride of sulphur dissolved in bisulphide of carbon. In the latter, rubber goods are suspended in a heated compartment in which the fumes of chloride of sulphur pass freely over the surfaces to be vulcanised. The period of vulcanising ranges from a few minutes to many hours, depending on the degree of heat employed, the nature of the compound, the thickness of the goods, etc. The rate of cure, shown in England by Dr. Philip Schidrowitz, is affected by the amount of protein or nitrogen in the crude gum, its stay in storage, its density, the amount of smoke, formalin or other preservatives used, quantity of acid used in coagulating the latex, time in drying, age of latex yielding tree, etc.

Since Charles Goodyear (*see* 12.240) in 1839 discovered, and in 1844 patented, his process for vulcanising rubber with sulphur by means of heat, numerous attempts have been made to improve upon his method, but the bulk of the goods produced is still cured by the sulphur and heat method. In the long train of experiments, many of which have led to important results, the curing of rubber has been effected by the use of sulphates, sulphides, chlorides, nitrates, fluorides, bromides, iodides and phosphides of nearly all the common earths and metals, as well as chlorine, sulphurous acid and various gases. The Russian chemist, Ivan Ostromislensky, vulcanised rubber with trinitrobenzene and other nitro compounds, imparting all the

qualities given it by sulphur and effecting the curing more rapidly than with sulphur, with but one-twelfth of the material, and at a lower temperature. Victor Henri, a French chemist, also reported in 1909-10 that he had vulcanised thin layers of rubber solutions by means of ultra-violet rays. Similar researches along the same line have much scientific, if not practical, interest.

An important vulcanisation development is the cold, dual gas process of vulcanisation, devised by S. J. Peachey, the English chemist, in 1918, after an investigation of the behaviour of rubber towards the various allotropic forms of sulphur. Unlike the Parkes process, which yields an addition-product of both sulphur and chlorine, this leads to the formation without the aid of heat of a sulphur addition equal to that produced by the hot-curing process. By it rubber, alone or compounded with fillers and pigments, is exposed in a compartment successively to the action of two gases, sulphur dioxide for 10 min. and hydrogen sulphide for 30 minutes. Diffusing through the rubber and interacting, the gases produce an especially active form of sulphur capable of combining with and vulcanising the rubber at ordinary temperature, and more thoroughly than by either the hot process or the sulphur-chloride cure. A density is acquired, it is said, unattainable by the older methods. The dual gas treatment can be used either for rubber in its original solid form or liquefied with a solvent. When used in the latter form two separate solutions of rubber in benzol or naphtha are prepared, one containing sulphur dioxide and the other hydrogen sulphide; then both are mixed, effecting, among other things, the wet moulting of goods heretofore produced only by the dipping process.

In the two-solution process, as it is called, the gases effect a complete peptisation of the solution, forming a jelly which, on evaporating the solvent, is found to be fully vulcanised rubber. One of the advantages claimed for the two-gas process is that fabrics, as well as organic fillers, such as leather waste, sawdust, woodmeal, etc., that would be more or less scorched or decomposed by the hot cure or the sulphur-chloride cure, could be used with rubber or heavy reformed leathers, linoleums, etc. It may also effect a considerable improvement in the water-proofing of cloth. Rubber footwear, it is stated, may be produced by the new process without either the heat or pressure hitherto deemed essential, and without special machines for stitching and riveting, thus greatly cheapening the product. In a later cold vulcanised process devised by S. J. Peachey, rubber in solid, dissolved, or emulsified form, is treated with a mixture of sulphides of phosphorus in a solid state or in benzol, carbon disulphide, or other solvent.

**RUDDER:** see FLETTNER RUDDER.

**RUHR,** the name given to a district of Westphalia, Germany, lying on the right bank of the Rhine and occupying roughly the lower basin of the river Ruhr (see 23.823).

**Description and Production.**—The Ruhr basin, which contains the important towns of Ruhrort, Düsseldorf, Duisburg, Essen, Bochum, Dortmund, Elberfeld, Gelsenkirchen and others, is the most important industrial district of Germany, or, in fact, of the continent of Europe. It is the heart of the German coal and metallurgical industry; the coke produced from Ruhr coal having peculiarly valuable metallurgical properties. The majority of the great German syndicates were formed and had their headquarters there, and the directors of heavy industry in the Ruhr—Krupp, Stinnes, Thyssen and others—controlled the economic destinies of Germany through their activities (metallurgy, coal, coal derivatives, chemical industry, dyestuffs, fertilisers, shipping companies, import and export of raw materials or manufactured goods). In 1913 the production of coal in the Ruhr was 115,000,000 tons out of a total for Germany of 191,000,000, which total was reduced by the loss of the Saar, Lorraine and Polish Silesia to 145,000,000. It produced 9,000,000 tons of cast iron, 10,000,000 tons of steel and a vast quantity of by-products.

Before 1918 the ores of Lorraine and the coke of the Ruhr were complementary, but, when Lorraine passed to France, the German ironmasters invested a great deal of the compensation paid them by the German Government in smelting works and blast furnaces duplicating those lost in Lorraine. At the same time they began to adapt Ruhr furnaces to the consumption of Swedish and other ores instead of those of Lorraine. The French thus saw the value of their newly acquired property in Lorraine threatened from two directions, especially as even without the duplication of plant in the Ruhr, the industry throughout the world seemed bound to suffer from over-production for many years as a result of post-War impoverishment.

**The French Occupation.**—According to the Treaty of Versailles only the left bank and bridgeheads of the Rhine were occupied; but on March 8 1921 Ruhrort, Duisburg and Düsseldorf, on the fringe of the Ruhr, were occupied as a military sanction. This gave to French troops occupation both of important blast furnaces and of the parts of the Ruhr and the Rhine through which these were supplied with Lorraine ore.

On Dec. 26 1922, against the vote of the British member, the Reparations Commission declared Germany in voluntary default in respect of timber deliveries and at the Paris Conference of the Allies (Jan. 2–Jan. 4 1923), France claimed that under Clause 18 of the Treaty of Versailles this declaration of default entitled her to take separate action, whereas the British reading of the clause was different. Actually, however, the plan of “productive pledges” had long been cherished in France. M. Dariac, President of the finance committee, had previously laid privately before the French Chamber a report on the feasibility of this plan, which was supported by the majority of the French heavy industrialists of the Comité des Forges. France also hoped by this action to assist her policy in the Rhineland.

Mr. Bonar Law stated the British view that the French proposals were “likely to have a grave and even disastrous effect upon the economic situation in Europe,” and the British Govt. could not therefore “take part in or accept responsibility for them.” Germany contended that the occupation constituted a breach of the Treaty of Versailles and a military invasion of a defenceless country in time of peace. She decided to oppose it by every means except armed resistance; subsequent events showed that there was no plan; methods of resistance being improvised as required. The temper of the population was such that the German Govt. required less to urge resistance than to deprecate violence.

The French concentration in Düsseldorf was met by a removal of the Kohlen-Syndikat with all its books from Essen to Hamburg, thus rendering it impossible for the French to obtain a comprehensive oversight of the intricate system of production and despatch of coal and coke over the network of railways and canals in the Ruhr. On Jan. 11, the first two divisions of French troops, preceded by armoured cars, light tanks and cavalry (together with Belgian troops) crossed the frontier and occupied Essen. The crowds were sullen and bitter, the French cold and determined, but correct. The Burgomaster struck the note that subsequently characterised the whole defence action by saying that he could not recognise the French commander's authority and would bow to force alone. The French declared officially that a peaceful mission of engineers had been despatched to Essen with a few troops to protect them. So great was the detestation of the Ruhr workers for militarism that no German troops had ever been stationed in the district; the men's leaders now declared that they would somehow make the French realise that bayonets were ill-adapted to coal-hewing.

Three days later the French occupied Buer, Bochum and Dortmund. The German Govt. prohibited any further reparation deliveries or payments to the invading powers. On Jan. 15 the first blood was shed when French sentries fired into a crowd, killing one man and wounding others. A military order to six directors of Thyssen's, Krupp's and other industrial concerns to deliver coal to France met with a refusal; the directors were arrested and tried by a court-martial which imposed heavy fines. Their return from Mainz to Essen provoked demonstrations of enthusiasm which the occupying powers could not suppress.

A short period of uncertainty followed. The French were taken

<sup>1</sup> *Miscell.* No. 3 p. 756 cmd. 1812 of 1923.

by surprise at the bitter resistance of the dour Westphalians. They occupied the state-owned mines and the Reichsbank branches, but the hostility of the workers and a financial panic led them temporarily to withdraw their troops. Partly owing to outside causes, but largely as the result of the occupation, the already depreciated currency began to plunge catastrophically; prices soared and fears of a blockade led to a rush on food shops.

*German Resistance.*—The French decided to break German obstinacy at all costs, but the more frequently the troops resorted to physical violence, the more resistance stiffened. The German police now became openly hostile; they were frequently arrested and severely handled or deported. Telegraph and telephone operators refused to work for the invaders, and the French occupied their offices, cutting off the civil population from this means of communication. The railwaymen, in accordance with the orders of their Government, also refused work, and, as troops occupied each station, went on strike, so that gradually all railway traffic ceased except for a few military trains. By the end of the month, not a single ton of coal had reached France, and the resistance only stiffened as the mass arrests and deportations of Germans began. By the end of the Ruhr struggle several thousand persons had been imprisoned and heavily fined, and some 140,000 men, women and children summarily deported at a few hours notice. Over one hundred Germans were killed by French and Belgian troops, who themselves lost about a score through German violence. Those imprisoned often suffered severely: there were many authenticated instances of brutal treatment, especially among those guarded by coloured troops or Separatists. (See RHINELAND.) Even where the French prison commandant was humane himself, the overcrowded state of the gaols inevitably made the punishment doubly severe, especially for men in high positions, as were so many of those condemned.

The German resistance aimed at putting the maximum difficulties in the way of the French, but it was realised from the first that time was on the other side. Huge sums were spent on strike pay for the railwaymen and later for the officials of the customs, taxation and forestry departments as these were seized by the French. The whole Ruhr industry—capital, masters and men—had to be indemnified during enforced idleness. Centres of resistance were formed outside the occupied zones by deported officials, secret telephone lines were kept working, courier services to avoid French postal espionage were organised and later employed to convey money when the French began to seize cash in the Reichsbank and elsewhere. Sabotage on the railways and canals began and, although the German Govt. denied responsibility, these acts of violence were certainly welcomed at one period.

The French countered with severe court martial sentences and local reprisals. Many persons were sentenced to death; and one was actually executed for an attempt to derail a coal train. Prominent citizens were forced to travel as hostages on French trains. Collective fines were imposed, and the "curfew" was applied to the towns near the scenes of attempted sabotages. Inhabitants had to be indoors with all windows closed from 4 or 5 P.M. till 6 A.M. Owing to the expulsion of the entire police force, the streets at night were exposed to the double danger of uncontrolled professional criminals and a nervous and irritated soldiery.

The French established a complete military and customs cordon, preventing first the export of coal, then of metals, and finally of all goods, offering to grant export permits on application and the payment of duties. This the German Govt. prohibited; and for many months practically no one applied, but with the lapse of time the French stranglehold began to tell.

German saboteurs, themselves liable to be shot at sight, retaliated from time to time, and several French sentries were killed and wounded. In April a detachment of French troops which had occupied a section of Krupp's works opened fire on a hostile crowd of workmen, killing 12 and wounding 30. The French declared that the directors were responsible, and subsequently sentenced Herr Krupp von Bohlen and four others to periods of from 10 to 15 years imprisonment. They were released after 8 months, however, as soon as the German heavy industry agreed to resume deliveries to the French on the collapse of German resistance. The widespread distress amongst the unemployed and hungry workers resulted in April and May in short-lived Communist control of one or two towns, the French standing aside. In June there was a serious German outrage, when 11 Belgian soldiers were killed by a bomb placed in a train by German saboteurs who escaped arrest.

Behind all this violence, French economic pressure slowly and at great cost began to show results. The railways were seized in the Rhineland and the Ruhr, and handed over to a Franco-Belgian "Régie" which kept a restricted railway service going with imported labour. Small quantities of coke were produced by French workers, and some of the coal accumulated at the pit-heads removed to France. The French issued a franc currency of their own, based on the Régie property. Large sums of money were confiscated and collected as fines, timber was cut down and exported and gradually a small number of merchants began to pay French export duties. No one was allowed to enter or leave occupied territory without a

French permit, and finally the frontier was hermetically sealed. Newspapers were suppressed, and their editors deported.

The hopeless struggle continued for nearly 300 days; then the chaotic state of German finance made it impossible for Berlin to continue to supply funds; on Sept. 27 1923 Berlin stopped the Ruhr credits, and orders were given to cease passive resistance. The area was now financially and economically devastated. The German Govt., its currency practically worthless, refused to finance reparations deliveries, and the industrialists, in order to export and keep their men working, were forced for a time to do so themselves. There was great distress, and serious industrial trouble in many towns. The French authorities nevertheless persevered in their policy despite the cessation of resistance, and their enterprises at last began to show considerable profits, although at the cost of serious damage to machinery, future production and Germany as a whole. But the French slowly realised that though German resistance was broken, they had not established a lasting system.

When M. Herriot succeeded M. Poincaré in May 1924, new methods were tried. The Dawes plan was adopted at the Conference of London in Aug. 1924 and preparations were immediately made to evacuate the Ruhr. By Nov. 15 1924 there was a total economic "evacuation" of the whole system of pledges, and all exploitation of the railways by the Régie came to an end. The military evacuation began in mid-July 1925; it was completed before Aug. 16. The three "sanction towns" of Düsseldorf, Duisburg and Ruhrort were evacuated on Aug. 25.

*Balance Sheet of the Occupation.*—The balance of the Ruhr occupation up to Jan. 1925, was estimated by the French and Belgian authorities as follows:—

| Receipts                                   | Gold Marks        |
|--------------------------------------------|-------------------|
| Coal tax                                   | 129,000,000       |
| Customs receipts                           | 163,000,000       |
| Licences and permits                       | 101,000,000       |
| Forests                                    | 27,000,000        |
| Profits of railway régie                   | 67,000,000        |
| Passports and miscellaneous                | 3,000,000         |
|                                            | <hr/> 490,000,000 |
| Expenses                                   |                   |
| Costs of collection and administration     | 16,000,000        |
| Costs of loading coal and exploiting mines | 54,000,000        |
| Military expenses (France)                 | 95,000,000        |
| Military expenses (Belgium)                | 19,000,000        |
|                                            | <hr/> 184,000,000 |

Credit balance 306,000,000 gold marks. In addition, France and Belgium obtained requisition and deliveries in kind to the estimated value of 491,900,000 gold marks.

Germany presumably reckoned her stubborn if unsuccessful resistance as a moral victory. The total cost of the occupation to Germany and thus indirectly to the world cannot be estimated. By Sept. 1923 German official figures estimated the approximate cost to Germany of the occupation at 3,500,000,000 gold marks. At this date it was unofficially estimated that France had lost about £40,000,000 worth of coal by her action. The great industrialists claimed compensation from the German Govt. amounting to 706,402,500 gold marks.

**RUMANIA** (ROMÂNIA), a kingdom of southeast Europe and a member of the League of Nations (see 23.825) bounded west by Hungary, northwest by Czechoslovakia, north by Poland, east by Russia, southeast by Bulgaria, southwest by Yugoslavia. As a result of the Second Balkan War and the World War, Rumania has more than doubled in size, having incorporated the provinces of Southern Dobruja (from Bulgaria), Bessarabia (from Russia), the Bukovina (from Austria), Transylvania and parts of the Banat (from Hungary). The area is now 122,282 sq. m., the estimated population (1922) 16,250,000. This includes minorities, some being of very considerable size. They

are of German, Magyar, Ukrainian, Bulgar, Jewish and Gypsy nationality (see MINORITIES).

### I. POLITICAL HISTORY

*Internal Position in 1911.*—Towards the end of 1911 the Liberal Ministry, now headed by J. J. Bratianu, was obliged to resign. Its last measures had been a law creating a supreme Consistory of the Church and the conclusion of a Convention with Austria-Hungary. Bratianu's successor was P. P. Carp, who on the death of G. Gz. Cantacuzene, had become head of the Conservative party. Among his colleagues in the new ministry were T. Maiorescu, N. Filipescu and the great lawyer and orator, B. St. Delavrancea.

When Parliament met, a campaign was opened against the new economic policy of the Liberals, which had been inspired chiefly by Vintila Bratianu, brother of the leader of the party, and aimed at combining the interests of private capital with those of communal and state capital in such great transport concerns as the electric tramways at Bucharest. The Liberal Opposition, numerically small, left the Chamber and combined with Take Jonescu, the creator of the new Conservative Democratic party, in a heated campaign for the overthrow of the Conservative Government. The Carp Govt. was reconstructed in April 1912 with Titus Maiorescu as Premier and Take Jonescu as the most important member of the Ministry.

*The Balkan Wars.*—In Oct. 1912 the Balkan League went to war with Turkey. Rumania, although she had not accepted military alliance with Turkey, was yet bound to Austria-Hungary by her adhesion to the Triple Alliance, and her sympathies were uncertain. She was therefore not taken into the confidence of the belligerents; in fact, Articles 2 and 3 of the Military Convention signed between Serbia and Bulgaria at Sofia (March 13) provided for mutual support in case either belligerent were attacked by either Austria-Hungary or Rumania. At first the

Rumanian Govt. expressed *désintéressement* in events beyond the Danube; but the rapid successes of the Bulgarians at Kirk Kilisse (Oct. 23-4) and Lule Burgas (Oct. 28-Nov. 1) aroused uneasiness in Rumania and Austria-Hungary alike. Rumanian public opinion demanded "compensation" in case of a division of Turkey in Europe; and the Government let the Bulgarian Govt. know that some correction of the frontier in the Dobruja would be required. Danev, then President of the Bulgarian House of Deputies, appealed to Austria-Hungary, who was in the difficult position of wishing to secure both Rumania and Bulgaria for allies, and this step aroused anxiety in Rumania.

Danev then proceeded to Bucharest himself in Nov. 1912, where he offered to renounce forever Bulgaria's claims to the Northern Dobruja and to modify the existing frontiers by flattening out salient angles in favour of Rumania. No agreement could be reached. Immediately after Conrad von Hötendorf, chief of the Austro-Hungarian general staff, was sent to Bucharest (Nov. 29 and 30) to attempt to arrange a modus between Bulgaria and Rumania, to calm Rumanian suspicions and to arrange a military convention between Rumania and Austria-Hungary. These moves were only partly successful. The conversations between Danev, Mişu and Take Jonescu were continued in London, but although Bulgaria was prepared to make concessions, no agreement could be reached as to their extent. At last the case was submitted to the Conference of St. Petersburg (May 17), which assigned Silistra to Rumania.

This arrangement, however, failed to satisfy the country. Carp, supported by Filipescu, was conducting a violent campaign against the Government, which was called upon either to resign or to declare war on the Bulgarians, and when Bulgaria suddenly attacked Serbia at the end of June, Rumania determined on military intervention. Russia advised in that sense, Serbia just then enjoying the support of the Russian Government. On July 10 1913 the Rumanian Army, 500,000 strong

crossed the frontier, occupying on one side the Southern Dobruja as far as Kavarna, and on the other side advancing upon Sofia by Vratsa and Orkhanie. The exhausted Bulgarian soldiers deserted *en masse*, and the Rumanians sent them back to their homes. As the Rumanian troops, commanded by the Crown Prince, drew near the Bulgarian capital, the Tsar Ferdinand despatched a telegram to King Charles asking for peace. Negotiations were immediately begun at Bucharest, where an Armistice was signed on July 31 1913, between Rumania, Serbia, Greece and Bulgaria. The Treaty of Bucharest was concluded on Aug. 10; Rumania obtained the territory which she had already occupied in the Dobruja and her rights of protection over the Vlachs in Macedonia were recognised.

But the result of this was to render Rumania's position more uncertain than ever. She was bound to Austria-Hungary by her secret adhesion to the Triple Alliance of 1883; her General Staff made fresh arrangements with the Austro-Hungarian Staff as lately as 1912 for the event of war with Russia, and the secret Triple Alliance was renewed for the fourth time in Feb. 1914. But this friendship was largely personal to King Charles and all the efforts of the Central Powers—Francis Joseph's visit to Bucharest, and that of Francis Ferdinand to Sinaia, could not make the relationship cordial. The younger generation was utterly opposed to this policy for two main reasons: the resentment aroused by the Magyar oppression of the Rumanians in Transylvania and Austria-Hungary's diplomatic support of Bulgaria. The latter now had unfortunate results; Austria-Hungary made a diplomatic intervention in favour of Bulgaria at Bucharest; the Austrian Minister there, Prince Fürstenberg, presented a note from Count Berchtold in which the recently-concluded Treaty was referred to as a simple "preliminary arrangement." This conception was energetically rejected, as was that of calling an European Congress to settle Near Eastern affairs "definitely."

Rumania became therefore more and more convinced of the necessity of a national policy in the interests of the entire Rumanian nation, whether in the Kingdom or under Austro-Hungarian or Russian rule. She hoped that Russia would enable her to realise her ambitions; but the visit of the Rumanian heir to the throne to St. Petersburg (March 27 1914), and of the Tsar to Constanța (June 14 1914) did not bring about a definite change of orientation.

*Rumania During the World War.*—Maiorescu had renewed the Triple Alliance in Feb. 1914; and when the World War broke out, J. Bratianu, head of the Liberal party, had succeeded him with a long programme of reforms—foremost among them being an agrarian law based on the expropriation of the large land-owners, and an electoral law establishing universal suffrage except for illiterates. Bratianu had never shown any intention of breaking with King Charles's policy, but in face of Italy's disclaimer of her obligations under the treaty, and Great Britain's declaration of war against the Central Powers, Charles I. and his advisers were forced to adopt the compromise of an armed neutrality. With the German check at the battle of the Marne, M. Take Jonescu passed from the first idea of "loyal neutrality" to that of intervention on the side of the Allies, and in this he was supported especially by the combative energy of Filipescu. The latter did not shrink from dividing his own party, opposing Alexander Marghiloman, who favoured the Central Powers, and, joining hands with his former rival, he effected a fusion with Take Jonescu. Meanwhile, Austria-Hungary and Germany concluded conventions by which Rumania was exploited to feed the population of the Central Powers. There were popular demonstrations against this policy, and Filipescu vehemently demanded rupture with Austria-Hungary. One great obstacle to this was removed by the death of King Charles on Oct. 10 1914. The Bratianu Govt. continued to negotiate with the Central Powers, but modelled its attitude on that of Italy. When Italy declared war in May 1915, Rumania nearly followed her example; but she still hesitated. In 1916 the Western Powers overcame Russia's objections, and Great Britain, France, Russia and Italy signed a treaty on Aug. 17 1916, by which they guaranteed

Rumania the Banat, Transylvania, the Hungarian plain as far as the Tisza, and the Bukovina as far as the Prut, in return for an immediate declaration of war. On the same day Russia and Rumania signed a military convention, Russia undertaking to unite with the Rumanian forces when they entered Transylvania, and to march in concert upon Budapest and also promising to send into the Dobruja troops sufficient to keep watch on Bulgaria. Rumania declared war on Austria-Hungary Aug. 27 1916. (For a fuller account of these negotiations see EUROPE, HISTORY.)

The Rumanian troops at once crossed the passes into Transylvania, but Germany began a strong counter offensive and had expelled them by mid-November. Bucharest was occupied on Dec. 6 1916. The army retired into Moldavia to reorganise there, sheltered by the Russian troops; the King, his Ministers and Parliament, had already retired to Jassy.

A counter offensive had begun in July 1917, when the defection of the Russians left Mackensen free to throw all his forces against the Rumanian army; which was rendered incapable of further resistance after the prolonged and glorious struggle of Mășărești in Aug. 1917. The Russian army disintegrated into pillaging bands; hostilities were suspended; and eventually it became necessary to submit to the Armistice imposed by the Germans at Focșani on Gen. Shtcherbachev, who had assumed the chief command on the Rumanian front over King Ferdinand's head (Dec. 6 1917).

*Agrarian and Electoral Reforms.*—Parliament had met at Jassy in Dec. 1916, and had determined to prosecute the war to a finish. Bratianu had formed a coalition with Take Jonescu and his section of the Conservative party. In April 1917 the agrarian question once more became urgent, largely owing to the effect on the public mind of the social revolution in Russia. In May direct and universal suffrage was introduced, raising the number of voters from 180,000 to over 1,200,000. Influenced by the Crown, the Conservatives in May 1917 at last accepted the radical policy of expropriation, to be applied to an area fixed at 2,000,000 hectares. A law was passed by a large majority on July 14, which left the original proprietors with a maximum of 500 hectares per estate (absentees being completely expropriated), and assigned them a compensation in State bonds, the amount not to exceed twenty times the value of the annual return from the property. A scheme for the communal holding by village associations of the land thus obtained was rejected in favour of traditional individual tenure.

*The Union of Bessarabia.*—On the break-up of the Russian empire, a "National Moldavian Committee" formed itself out of the Rumanian elements in Bessarabia (May 1917); in August the Ukrainian National Rada recognised Bessarabia as a separate unit. In Oct. a Supreme Council (Sfătul Țării) for Bessarabia was set up, the various nationalities being represented on it proportionately. On Dec. 17 this body proclaimed an independent Moldavian Republic, and invited Rumania to send troops into the country for its defence. Rumania took this step, partly in order to guard the large food depots which she had accumulated there. Russia protested, and a state of war existed between Russia and Rumania from Jan. 28 1918 till March 9, when an agreement was reached that the Rumanian troops should withdraw. On April 8, the Sfătul Țării voted for political union with Rumania, Bessarabia, however, to retain a large degree of autonomy. The Central Powers sanctioned this arrangement by the Treaty of Bucharest to compensate Rumania for her other losses. No Russian Govt., however, admitted the validity of these arrangements, as the Rumanian troops had not been withdrawn as agreed, and the Ukrainian representatives of the Sfătul had abstained from voting.

*The Treaty of Bucharest.*—In face of the equal impossibility of either organising resistance or signing a treaty of renunciation, Bratianu resigned on Feb. 9 1918. Gen. Averescu was charged with the peace negotiations at Buftea, near Bucharest. Von Kühlmann advised that only economic terms be imposed; but Czernin, for Austria-Hungary, insisted on territorial changes. The Dobruja was ceded as far as the Danube, Bulgaria taking over the southern half which she had lost in 1913, while the

Quadruple Alliance administered the northern half conjointly. Rumania was to have a trade route to the Black Sea via Constanța. The Rumanian army was to be demobilised except for eight divisions. The frontier of Hungary was advanced in the Carpathians. The Central Powers secured such terms on the Danube, in the Rumanian oilfields and over the railways, as would have placed Rumania in a state of economic slavery to them for many years. Averescu's Cabinet hesitated to sign and resigned on March 12. Cernin, however, brought a personal message to the King that his dynasty would be endangered unless the peace were concluded. The Germanophile Marghiloman Ministry was appointed on March 18 and the Treaty was signed at Bucharest on May 7 1918.

Marghiloman's Ministry struggled against almost unsurmountable difficulties throughout the succeeding months. In the occupied territory everyone was snatching greedily at the remnants of national prosperity; the Central Powers forced the Banque Générale to issue no less than 2,500,000,000 lei in paper money, and disorganised the finance of the kingdom; while economic ruin was ensured by the exportation of sheep and cattle, the cutting down of forests and the dismantling of factories. The population meanwhile was starving, reduced to famine rations, and the morale of its working-class was being perverted by revolutionary propaganda.

*Peace: the Formation of Greater Rumania.*—On Nov. 8 1918, when the defeat of the Central Powers was assured, the King called to power Gen. Coandă, an old soldier who had already had diplomatic experience, with Gen. Grigorescu, to whom was due the chief credit for the stubborn resistance at Mărășești, as Minister of War. Coandă repealed all laws introduced by the Marghiloman Ministry and decreed universal, obligatory and secret suffrage for all male voters over 21. The King re-entered Bucharest Nov. 30 after the German troops had evacuated Rumania under the terms of the Armistice. Bratianu again became Minister on Dec. 14.

The new Liberal Govt. had the extraordinarily difficult task of reuniting provinces which had been under the domination of different alien States, Bessarabia was already incorporated in the ancient kingdom, having abandoned the idea of autonomy. Her Council voted for unconditional incorporation on Dec. 9 1918. In Transylvania the Magyar administration throughout the war had ruthlessly oppressed the Rumanians, who formed the majority in the rural districts.<sup>1</sup> The prisons were filled with suspects; who were executed on the slightest pretext; a measure was framed to expropriate in favour of alien immigrants the widows and children of soldiers killed in action. When Vienna and Budapest repudiated the Hapsburgs, a great Rumanian assembly at Alba Iulia declared that Transylvania henceforward formed part of the kingdom of the United Rumanians but that they promised absolute national liberty to their Saxon and Magyar fellow-citizens (Dec. 1). The Saxons gave their adhesion at a meeting held at Mediaș, Jan. 21 1919; but the Magyar bishops, Catholic, Calvinist and Unitarian, did not take the oath of allegiance to King Ferdinand till 1921. A Council of Direction, presided over by Julius Maniu, formed a provisional Government. A general Assembly of the Rumanians in the Bukovina (who, however, by Austrian statistics, numbered rather under one-half of the total population) voted the union of their province with Rumania in a meeting held at Czernowitz, Nov. 28 1918.

During the first few months of its existence, the Liberal Govt. carried on difficult diplomatic negotiations for the recognition by the Allies of the new frontiers. Those fixed by the Agreement of Aug. 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea-Mare, and the Yugoslavs the western half of the Banat. A line of demarcation was fixed in Hungary, and Rumanian troops occupied the country up to this line, pending final settlement by treaty. In March 1919 a further "neutral zone" was established and Rumania was given the right of occupying it. Bela Kun's Govt., which now came

into power in Hungary, started a campaign, as a result of which the Rumanians advanced to the (Theiss) Tiza, where they were stopped by the Allies on May 9. On July 22 Kun started a new offensive; but the Rumanian army defeated his troops, crossed the Tiza—despite the interdiction of the Allies—and occupied Budapest on Aug. 4. Here they remained in the face of numerous protests until November 14. The Treaties of St. Germain and Trianon recognised as Rumanian the predominantly Rumanian territories of the old Dual Monarchy. Austria quickly agreed; but Hungary resisted till 1921, and Rumania was only able to demobilise in April 1921 (see HUNGARY).

*Post-War Politics.*—The Bratianu Govt. resigned on Sept. 13 1919 as a protest against Article 60 of the Treaty of Trianon (Minorities Clause), especially as two successive measures had already been passed granting full political rights to the Jewish population without distinction between old inhabitants and recent immigrants. New elections were held on Oct. 3 by a provisional "Ministry of Generals," presided over by Arthur Vaitoianu. They gave a large majority for the Peasant party, whose chief was the rural school teacher John Mihalachi, and the National Democrats; the Liberals now formed only one-fifth of the total number of Deputies; a certain number of Socialists made their appearance in this first Parliament of United Rumania. The majority parties coalesced as a *bloc parlementaire*, and on Dec. 9 1919 formed a democratic Government of advanced tendencies. The President was the Transylvanian Alexander Vaida Voevod, who at once visited Paris and London and obtained the formal recognition of a Rumanian Bessarabia.<sup>2</sup> Dr. Lupu was Minister of the Interior. During the Premier's absence, however, the landowners agitated against proposed expropriation, and the court and society felt alarmed at the Bolshevik propaganda. The Cabinet was forced to resign and Gen. Averescu became Premier (March 19 1920) with the support of the "League of the People" which he had founded in April 1917, an organisation which included many Conservatives and some new men. He also concluded a pact with Take Jonescu's Conservative Democrats. Elections were held early in June. Averescu's party won a large majority even in Transylvania. Take Jonescu became Minister for Foreign Affairs in his Government (June 21 1920).

*The Averescu Government.*—The chief object of the Averescu Govt. was what it called "the re-establishment of order." In fact the Bolshevik danger continued on the Dniester, where a real revolutionary movement had been attempted at Hotin under the previous Government; the Soviet Russians no doubt had friends, not only in Bessarabia, but also in the "Ancient Kingdom" and the odious crime in the Senate<sup>3</sup> had shown to what lengths their fanatical ardour could go. It was thought necessary therefore to continue the régime of press censorship, and in May 1921, as the Communists had begun to hold a Congress at Bucharest, which seemed likely to be the beginning of fresh activities, the Minister of the Interior, who held proofs of their relations with the Third International of Moscow, had all the participants arrested and brought to trial, the trial being unduly prolonged. A law on workmen's unions, first of all received with noisy protests in working class circles, soon succeeded in securing agreement to accept State mediation between masters and men, and after that, thanks to a change of attitude on the part of the men, the number and importance of strikes diminished. But, up to the present, except for one school for apprentices, nothing was done for the instruction or education of the urban classes.

*Agrarian Reforms.*—At the same time the popularity of Gen. Averescu among the rural population forced him to carry through his agrarian reforms. The bill was only introduced in the spring of 1921, by the Minister of Agriculture, Garofid, a big landowner, who belonged to the "progressive" party of the Germanophiles led by Marghiloman. This experienced economist would have

<sup>2</sup> (s. V. V. Tilea, *Actiunea Diplomatica a României* (Nov. 1919–Mart 1920), Sibiu, 1925).

<sup>3</sup> On Dec. 9 1920 an infernal machine exploded in the Senate killing the bishop Radu, and mortally wounding D. Grecianu (the Minister of Justice) and another Senator.

<sup>1</sup> According to the official Austro-Hungarian statistics of 1910, 2,948,186 in Hungary (Transylvania and the Banat); 275,088 in Austria (the Bukovina)

liked a practical organisation of small holdings, giving land only to those who could ensure a good return, and guaranteeing a supply of rural labour to the remaining big estates. In the Chambers, composed of varied social strata and with cross-currents, but with a predominance of the Left Wing, the opposition of the Minister and the hesitations of the President of the Council had to be surmounted in order to secure decisions favourable to the peasantry in general. The principle was recognised that the break-up and distribution of the land was a reward for the sacrifices of the peasants during the war; on this basis several categories were distinguished, not always wisely. There were passionate discussions on purchase price, methods of payment and rights to the subsoil, of special importance in petroleum-bearing districts. The Right Wing of the party, which was a conglomeration kept together by the General's sole authority, was victorious. The State added to the sum to be paid by the new owner a payment to be raised from a special tax on new fortunes, and the subsoil was not allotted to the State, as the Left Wing wished. Later on regulations drawn up by the Liberal Minister of Agriculture were to change in many respects the enactments of the Garoflid law (*see LAND TENURE*).

*Fiscal Reform.*—After March 1921, before the solution of the agrarian question, the Finance Minister, Nicolas Titulescu (later Rumanian Minister in London), who was considered the eventual successor of Take Jonescu in the Democratic party, from which he was cutting loose at this time, introduced the bill on new taxation. The old taxes, a mixture of oriental features and modern innovations, were impossible. Public opinion demanded an energetic attack on ill-gotten gains, but their possessors had long since assured them against attack. The rural democracy opposed all burdens on the newly acquired small holdings, which were, and still are, badly consolidated. The Minister, who had his own point of view, favoured the French system of taxation, but had to take into account in his legislation all these interests and tendencies, and, while introducing some happy innovations on several points, certainly went beyond what could be carried out in the country.

*Foreign Policy.*—M. Take Jonescu gave Rumanian foreign policy a definite direction. Marriages were concluded between the Crown Prince and Princess Helen of Greece, March 10 1921, the Princess Elisabeth and the Crown Prince of Greece, Feb. 27 1921 and Princess Marie and King Alexander of Yugoslavia, June 6 1922.

Rumania and Poland were equally threatened by Russia, who had never recognised Rumania's right to Bessarabia, and seemed little satisfied with Poland's right to retain her White Russian and Ukrainian territories. Sapieha's journey to Bucharest brought the conclusion of the Rumanian-Polish Treaty (March 3 1921), which provided for mutual assistance in the event of an unprovoked attack upon either party on their eastern frontier; for common diplomatic action towards their eastern neighbours; and for a military convention. Rumania took cognisance of Poland's agreement with France, Poland of Rumania's agreements with other States for the maintenance of the Treaties of Trianon and Neuilly.

The last-named clause referred to Rumania's relations with the Little Entente. Czechoslovakia and Yugoslavia had already signed a convention for mutual protection against aggression by Hungary (Aug. 14 1920). Immediately after M. Beneš visited Bucharest (Aug. 19), with a view to including Rumania in the agreement. The Hungarian danger was common to all; but Take Jonescu would have desired a wider defensive alliance to include Greece and Poland, for mutual guarantee against any aggressor, including Russia or Bulgaria. The Russophil Govts. of Prague and Belgrade could not agree to this; but Rumania concluded a Convention with Prague for mutual protection against an attack from Hungary (April 23 1921) and with Belgrade against an unprovoked attack from Hungary or Bulgaria (June 7 1921). Since this date Rumania has formed a part of the Little Entente, and as such has taken part in its periodical deliberations, her Eastern policy being regulated by agreement with Poland (*see*

POLAND, CZECHOSLOVAKIA and LITTLE ENTENTE). The dispute with Russia remained acute. At Geneva, to which the head of the Government went in person, and at Lausanne, where the Foreign Minister attended, the Bessarabian question was brought no nearer solution. Italy and Japan refused to vote the support which had been granted to the Vaida Government. During 1924 Russia kept up continuous agitation and threat of war; for three days in 1924 there was even a communist republic at Tatarbuniar in South Bessarabia. A conference with the Soviet representatives held in Vienna (March 27 to April 2 1924) led to no result, although an understanding was reached at Cetatea Albă to prevent incursions of Bolshevik bands. The Russian danger continued to impose a heavy burden on Rumania.

*The Bratianu Government.*—From the beginning of the year 1921 the Liberals, who only had four representatives in Parliament, demanded power. A national festival was organised on the occasion of moving the ashes of J. C. Bratianu, the great Minister of King Carol. Great popular demonstrations, artificially promoted, were organised to show the King that the party had regained its popularity among the rural masses.

On the occasion of a vote on a mining concession in the Banat, a concession later on repudiated by the Liberal régime, the entire opposition left the Chamber not to return. The new session of Parliament was opened, Nov. 1921, with bad prospects for the Government. The King formally demanded a détente; Gen. Averescu took offence. Take Jonescu took power (Dec. 17). During Dec. he made efforts to gain a majority. Only the Nationalist Democrats gave him unreserved support; the Transylvanian party voted for him when it came to the decisive moment. But his old associates dominated Parliament; on the re-opening of the session a vote of confidence in the Democratic leader was rejected (Jan. 17 1922).

A coalition ministry was expected, as an outcome of the struggle against the Averescu Govt.; it would have united the Liberals, the Transylvanians, part of the Bessarabians (except the powerful Peasant party) and the Bukovinians, and had also the support of the Nationalist Democrats who had considered Take Jonescu's advent to power as an intermediate solution. However, after indecisive discussions on the division of candidatures, the King was forced to accept M. J. J. Bratianu, as he was convinced of the necessity of retaining in political life this Liberal party of the bourgeois Right Wing, and preferred unity of direction which had been so much insisted on (Jan. 19).

The head of the new Government believed he had a mission to save the country, and a right to the exceptional measures of a dictatorship, and at the same time proposed to strengthen his party so as to avoid in future such bad luck as that through which it had lately passed. The elections were forced and he, owing to his personal unpopularity, was opposed by the People's party, the popular Transylvanians, the Peasant party and the Nationalist Democrats. The opposition parties declared the Parliament illegal and all legislation passed by it null and void in their eyes, and abstained from voting. A party administration took office almost at once. The brother of the president of the council, M. Vintilă Bratianu, was entrusted with the task of re-establishing order in the finances, which were endangered by the quantity of Treasury bonds and unfunded loans.

*The Coronation and the Constitution.*—But at the same time M. J. J. Bratianu thought it necessary to give the country the imposing ceremony of the coronation of the King and Queen, which had already been prepared for by the preceding Government, and to draw up a constitution. On Oct. 15 1922, Ferdinand I. and Queen Mary assumed the crowns of United Rumania at Alba-Iulia, without the presence of any representative of the party which had given the kingdom this beautiful province. The proposed constitution was only introduced in the spring of the following year, in the Chambers which had no legal right to adopt it. The new law of the Constitution, debated by the Nationalist Democrats only, and with reservations, was adopted March 28 1923. It was only a reproduction of that of 1866, with the addition of the election of deputies by universal suffrage, with a vague right of representation of electoral minorities,

and adding to the Senate the old dignitaries and members of Parliament and representatives of the Chambers of Commerce and Agriculture. The subsoil and forests were nationalised. The admission of Jews to citizen rights was incorporated in the Constitution, but open competition with the newcomers provoked violent trouble in the universities, which was exploited by politicians whose ambitions had not been satisfied, and still continues. A local government law followed tradition, as did also educational reform. In agrarian affairs, in labour questions, in military matters, and above all in foreign affairs, there were no innovations. In the financial sphere the position was long maintained of isolation towards foreign capital; the attempt to commercialise properties and State enterprises did not succeed.

The Opposition was systematically divided, indeed this was the basis of a policy which disdained popular support and showed itself indifferent to Parliamentary criticism. However, at one time the Transylvanians and the Peasant party seemed to have united; then having abandoned united action, the former joined the friends of Take Ionescu, who died on June 21 1921. In 1924 M. Argetoianu, the leading member of the Averescu Govt., separated from the General, and joined the Nationalist Democrats. In March 1925 this Nationalist-Popular party united with the Transylvanian party and became the National party. The new party came to an understanding with the Peasant party and the allies gained a great victory in the elections for the Chambers of Agriculture in August.

The Opposition, which had long been so sterile, was thus becoming formidable. In June 1924 a mass meeting of peasants under Averescu demonstrated in the streets of Bucharest, and a tumult was feared. The same year saw a number of financial scandals in the Liberal party. The Opposition coalition produced a programme based on fulfilment of the wishes of the peasants and the national minorities, the abolition of arbitrary government and a new financial policy.

It was generally believed that the long government was coming to its close. It had had its faults—notably its doctrinaire opposition, almost up to the last, to the competition of foreign capital, which was only admitted under irritating restrictions to the exploitation of the oilfields. None the less, it had helped to consolidate the financial position of the country. The Opposition of the National and Peasants' parties abandoned the violent attacks which they had commenced in May and June in view of the approaching end of the régime, while the People's party negotiated with the Liberals in the hope of forming the next government with their support. Nevertheless M. J. J. Bratianu wished to carry his reforms through to the end. The law for the unification of the Church had already been passed, introducing the Transylvanian system of elective councils for each parish, each diocese and for the religious life of the country in general. In the autumn he put forward an Education Bill which was attacked, not only by the national minorities, but even by the Rumanian opposition parties because it infringed on the liberty of private, religious and national education by imposing on it too strict state control.

*The Crown Prince Charles.*—At the end of Dec. the heir to the throne, the Crown Prince Charles, who had done much for his country by his "institute" of national propaganda, and by his expert advice in military and especially aeronautical matters, left Rumania under circumstances which permitted his enemies to unite against him. At Venice he renounced all his rights, including that of bringing up his little son Prince Michael, and repeated his intention of disassociating himself from his country. Meanwhile, a crown council had met at Sinaia. The King insisted that the party leaders recognise the situation created by the Prince's action. There were some doubts expressed as to the advisability of this measure, but the decision which the Sovereign took on Dec. 31 was not to be shaken. On Jan. 11 1926 the Chamber of Deputies and the Senate met to discuss the new situation regarding the succession to the throne. Gen. Averescu voted for the government plan; the real Opposition abstained from voting. A provisional Council of Regency was immediately formed consisting of the Patriarch Miron Cristea, the President

of the Supreme Court of Appeal, Buzdugan and Prince Nicholas, the second son of the King, who was recalled from England where he was studying. The King's recent very serious illness had necessitated this measure.

*The Parliamentary Situation.*—When the Chambers re-assembled, Bratianu forced through an electoral law of the Fascist type. The version presented to the Senate was much more liberal. Any party which received 40% of the total votes cast, the other votes being divided among several political bodies, was rewarded with half the number of seats, without counting what it got on the scrutiny (March 1926). In holding local elections in Feb., the government had believed that it would secure a basis which would enable it to continue in power. It was deceived. Almost all the large towns voted for the Nationalist and "Peasant" Coalition, which had been joined by Averescu's party. In the country the government machinery was able to prevent the Opposition candidates from coming forward, and the government lists were declared elected in three thousand rural communes. Nevertheless, Bratianu saw that he must retire. Consultations which the King held at the end of March with the Opposition leaders looked as if they would end by forming a National or National Peasant Govt. in accordance with the results of the last election. This would have corresponded to the parliamentary situation. The King, having demanded a ministerial coalition of the three groups, asked for a list for each group. Although the Nationals and Peasants had presented a common list under the presidency of M. Maniu, one of the leaders of the National party, the King entrusted Averescu, who had been joined by the small Progressive group with the task of forming a government.

## II. DEFENCE

Military service in Rumania is universal and personal. All Rumanians, without distinction of race, language or religion, are liable to service. The duration of service is for 29 years between the ages of 21 and 50, divided as follows: Two years in the regular army, or three years in the navy; 18 years in the reserve and nine years in the militia. On completing 19 years of age, young men are liable to be called up for preparatory training. Certain classes of persons are exempted from service for social reasons, and volunteers are also allowed.

The Army is organised in 7 army corps and 1 corps of mountain light infantry. It consists of 66 regiments of infantry (168 battalions, each with a machine-gun company); 1 regiment of tanks (2 battalions); 20 regiments of cavalry (12 regiments Red Hussars, 7 regiments Black Hussars, 1 regiment Royal Escort); 21 regiments (144 batteries) of field artillery; 4 regiments (96 batteries) field howitzers; 2 groups (6 batteries) horse artillery; 2 brigades (18 batteries) mountain artillery; 4 groups (8 batteries) mountain howitzers; 14 groups (42 batteries) heavy artillery. Besides these "normal" batteries there are special and heavy batteries. There are 6 battalions railway engineers, 2 signal, 2 bridge, 1 motor transport, 4 pioneers, 2 mountain pioneers.

The air force consists of 3 groups of scouting planes, 2 of fighting, 1 of service, 1 of naval; 1 balloon group and 1 air defence regiment. The aeroplanes in use are of very various types. The effectives of the air force (1925) were: 487 officers; 518 re-engaged; 3,450 men; total, 4,455.

The navy consists of a Danube Division with 7 monitors, 7 patrol boats, auxiliary and minor vessels, a land river defence force with mine-laying groups and coastal artillery; a naval river base, including wireless stations and a naval arsenal; and a Maritime Division, consisting of a maritime naval force (2 destroyers, 6 torpedo boats, 5 gunboats, etc.), a land maritime defence force (coast battery, mine-laying group), base and training school. There is a corps of frontier guards, consisting of 20 battalions; and a corps of gendarmes with 14 battalions. The budgetary effectives in 1925 were: officers, 12,344; re-enlisted 10,509; N.C.O.s and men, 116,974; civil servants employed by the army, 3,342. The defence expenditure of the Ministry of War in 1925 was 4,324,650,000 lei, of which 3,853,638,000 were for the Army; 120,619,000 for the Navy; 349,489,000 for the Air Force; and 908,000 for the Army Endowment Fund Expenditure on frontier troops as charged to the Ministry of Finance. Arms and munitions were up to 1925 generally bought in foreign countries; but it was proposed to establish a large munitions factory in Rumania which should cover the requirements of her fighting forces.

### III. ECONOMIC AND FINANCIAL HISTORY

*Area and Population.*—The peace settlement after the World War more than doubled the area of Rumania and nearly doubled the population which is predominantly rural. The total area of the country and the population are distributed as follows:—

|              | Sq. Km. | Population |
|--------------|---------|------------|
| Moldavia     | 38,058  | 2,233,556  |
| Muntenia     | 52,505  | 3,485,859  |
| Oltenia      | 24,078  | 1,484,706  |
| Dobruja      | 23,262  | 693,190    |
| Bessarabia   | 44,422  | 2,344,800  |
| Bukovina     | 10,442  | 811,721    |
| Banat        | 17,980  | 910,393    |
| Crishana     | 17,086  | 1,145,113  |
| Maramuresh   | 8,592   | 466,956    |
| Transylvania | 57,819  | 2,685,833  |
|              | 294,244 | 16,262,127 |

*Agriculture.*—The 23,737,420 hectares of Rumanian agricultural and forest land are used as follows:—

|                                                | Hectares   | Per Cent of Total |
|------------------------------------------------|------------|-------------------|
| Arable land                                    | 11,731,420 | 49.4              |
| Meadowland and pastures                        | 4,278,659  | 18.0              |
| Forests                                        | 7,241,720  | 30.2              |
| Trees, shrubs and bushes (including vineyards) | 485,248    | 2.4               |

Before the War Rumania was still a country of great estates and one of the great wheat-exporting countries of Europe. The peasants were emancipated in 1864, and from time to time distributions of crown land were made, but in insufficient quantities to satisfy the general land hunger. The distribution of arable land in 1905 is given as follows by Mr. Sisești Jonescu:—

| Size of Holdings | Area in hectares | Percentage of total area | No. of landowners |
|------------------|------------------|--------------------------|-------------------|
| Under 10 ha.     | 3,153,645        | 40.29                    | 920,939           |
| 10-100 ha.       | 862,800          | 11.02                    | 38,723            |
| 100 ha. and over | 3,810,351        | 48.69                    | 5,385             |
|                  | 7,826,796        | 100.                     | 965,047           |

Distribution was equally unsatisfactory in the newly acquired provinces of Bessarabia and Transylvania, but in Bukovina the peasants already held a considerable share of the land. The pledges given by the Constituent Assembly of 1917 for the division of the land were fulfilled in Agrarian laws for Bessarabia, 1920; for the old Kingdom of Rumania, 1921; for Transylvania and Bukovina, 1921. The Rumanian law provided for total expropriation of landlords resident abroad, foreigners, corporate bodies and for partial expropriation of resident large owners.

#### THE PROGRESS OF EXPROPRIATION TO NOV. 15 1924.

|                                                  | Old Rumania.     | Transylvania.    | Bessarabia. | Bukovina.        |
|--------------------------------------------------|------------------|------------------|-------------|------------------|

The thousands of peasants who took over the land in the first years of the agrarian reform were unskilled in management, inadequately organised on the co-operative side, and lacked machinery and capital. The immediate results of the land reform were a large reduction in the output of wheat and cereals, and a diminution of production generally. The changes in production are shown by the following table:—

| In thousands of metric tons |       |       |       | Pre-War Averages (Estimate for Present Territory) |
|-----------------------------|-------|-------|-------|---------------------------------------------------|
|                             | 1919  | 1924  | 1925  |                                                   |
| Wheat                       | 1,797 | 1,916 | 2,850 | 4,574                                             |
| Rye                         | 338   | 151   | 203   | 524                                               |
| Oats                        | 528   | 610   | 740   | 1,504                                             |
| Barley                      | 786   | 670   | 1,019 | 1,457                                             |
| Maize                       | 4,142 | 3,949 | 4,159 | 5,912                                             |

Rumanian economists are inclined to believe that the division of the land will lead to ultimate increased total production, but not necessarily to the resumption of the pre-War production of wheat. The peasants grow more maize and fodder crops for use on the farm, and individual households consume more. Another reason for the decrease in the cereal export (wheat was actually imported in 1924) is that, whereas Old Rumania was a compact agricultural country, Greater Rumania includes industrial and mining districts which absorb some of the food products formerly exported.

A useful index of the prosperity of Rumanian agriculture is the number of animals maintained. The figures are as follows, but account must of course be taken of the change in frontiers:—

|        | 1911      | 1920      | 1925       |
|--------|-----------|-----------|------------|
| Cattle | 2,667,000 | 4,730,000 | 5,399,000  |
| Sheep  | 5,269,000 | 8,690,000 | 13,612,000 |
| Pigs   | 1,021,000 | 2,514,000 | 3,133,000  |
| Horses | 843,000   | 1,485,000 | 1,845,000  |

*Rural Co-operation.*—With the post-War law giving the land to the peasants the rôle of the co-operative societies was changed. The whole organisation had been destroyed by the German Occupation, and it was necessary to begin to build *de novo*. The Central Credit Bank has a capital of 12,000,000 lei, of which two-thirds were found by the State. The nominal capital was increased in 1923. The rural societies provide the peasants with seeds, machinery, etc., and in many cases make arrangements for the collection and export of produce. There were at the end of 1924 over 2,500 societies, with 236,713 members.

*Mining.*—The chief mineral wealth of Old Rumania lay in the rich petroleum deposits. In 1913 Rumania produced 1,885,000 tons of petroleum, standing fourth in the rank of petrol-producing countries. In the autumn of 1916 an Allied Mission, acting in concert with the Rumanian Govt., put the fields out of action in order to prevent the exploitation of the wells by the Germans. Production fell to 517,000 tons, but by 1925 was restored to 2,316,000 tons (provisional figure), considerably higher than the pre-War figure. This progress was made in spite of heavy restrictions placed on the industry by the imposition of maximum prices in Rumanian markets. A decision of Dec. 15 1923 removed the maximum price limitation and restored freedom to export, subject to an export tax, all petroleum products except crude and residues. The industry was affected by the new Constitution voted in March 1923, Article 19 of which nationalised subsoil rights, though existing rights were respected. When new oil-bearing land is to be exploited permission must be obtained from the Government. In theory 60% of the capital in an industrial enterprise must be Rumanian and there must be a certain percentage of Rumanians on the Board. Rumanians must be employed in all industrial concerns, and if foreign labour is imported, cause must be shown. The majority of the big foreign companies conformed to this ruling, and have found that in practice the new system works reasonably smoothly.

The other principal mineral products are coal, natural gases and salt. The coal supply was formerly insufficient to meet requirements, and supplies were imported, chiefly from Poland. The output of the coal mines is, however, steadily increasing and at the beginning of 1924 the State Railway authorities decided not to purchase any foreign coal. In 1925 the Govt. imposed a high import duty to prevent the import of coal. They were probably influenced in this decision by the continued increase in the supply of petroleum residues which are largely used by the railways.

According to the figures of the Ministry of Industry and Commerce the annual coal output for the years 1922 to 1924 was as follows:—

|                                               | 1922        | 1923        | 1924        |
|-----------------------------------------------|-------------|-------------|-------------|
|                                               | Metric tons | Metric tons | Metric tons |
| Lignite of 3,000 to 7,400 calories            | 1,861,579   | 2,229,410   | 2,479,083   |
| Stone coal and anthracite of 6,000-8,000 cal. | 254,642     | 291,983     | 297,288     |
| Total                                         | 2,116,221   | 2,521,393   | 2,776,371   |

With the annexation of Transylvania, Rumania acquired the coal, iron, gold, silver, lead and copper mines of that province. The whole of the ore is handled in the three metal works owned by the State. The development of these mines is delayed by the lack of coking coal.

*Trade.*—The three principal exports from Rumania are cereals, petroleum products and timber. Quantities for the years 1921 to 1924 show a gradual improvement.

| (In metric tons, 000's omitted) |       |       |       |       |       |
|---------------------------------|-------|-------|-------|-------|-------|
|                                 | 1921  | 1922  | 1923  | 1924  | 1925  |
| Cereals                         | 1,579 | 1,278 | 1,845 | 1,414 | 845   |
| Petroleum Products              | 362   | 436   | 403   | 436   | 783   |
| Timber <sup>1</sup>             |       | 1,793 | 2,225 | 2,483 | 2,467 |

<sup>1</sup> Total not available.

Other exports are hides, wool, vegetable oils, wood manufactures, fruits, etc. The principal imports are manufactured goods (a large part of which are textiles), colonial produce and chemicals. The complete breakdown in the export of wheat in 1924-5 was only temporary and was due to the peasants holding their stocks in anticipation of a rise in prices which did not occur (in fact the world price of wheat fell), to lack of transport and to the increased home consumption and high export taxes already mentioned. In view of the low figure of export trade in 1925 the export taxes were heavily reduced in 1926.

Taking only imports for domestic consumption and exports of domestic produce, Rumania showed before the War a large favourable balance of trade, due to the wheat export. In the years immediately following the War the balance was adverse, but the tide turned in 1922 and the monthly averages after that date indicate the recovery she made, which, however, saw a setback in 1925.

Monthly Averages of Imports and Exports  
(In thousands of lei)

|      | Imports   | Exports   |
|------|-----------|-----------|
| 1921 | 1,012,093 | 682,051   |
| 1922 | 1,027,114 | 1,169,941 |
| 1923 | 1,626,336 | 2,050,872 |
| 1924 | 2,182,704 | 2,318,633 |
| 1925 | 2,501,511 | 2,383,928 |

*Finance.*—The fundamental factor in foreign exchange in Rumania is the grain harvest and the facilities for moving it, for the lei with which Rumanian merchants can purchase foreign goods are the profits on the cereal export. There was much headway to make up, owing to the devastating effect of the German occupation and the temporary chaos in agriculture which followed the expropriation of the large estates. The financial position was made more difficult by the expenses incurred by the invasion of Hungary in 1919 and by the large expenditure on armaments due to Rumania's political situation, and especially to the refusal of the Soviet Govt. to agree to the Rumanian status of Bessarabia. During the occupation the Germans issued some 2½ milliards of lei; they also secured large sums of Rumanian gold by the sale to the peasants of goods, especially sugar, of which there was a great scarcity. Under the peace treaty Germany was to repay her various depredations, but it was eventually agreed between the two Govts. that the demand should be met in part at least by the delivery of locomotives and other goods. On taking over her new territories Rumania also had to take over 8½ million Austrian kronen and 2 milliards of Russian rubles. Further, at the time of the German invasion the bullion of the National Bank, with much private property in jewels and treasure, was sent to Moscow for safety. This property, valued at 315,000,000 lei gold, is estimated as irrecoverable. The decline in the value of the lei was rapid between 1918 and 1922, during which period the amount in circulation increased from 2½ milliards to 15 milliards. The decline in the value of the lei, normally equivalent to the franc, during this period is shown in the following table:—

| Mean Rate to the £ Sterling |        |          |        |
|-----------------------------|--------|----------|--------|
| 1919                        | 79     | 1922     | 673.16 |
| 1920                        | 203.41 | 1923     | 948.75 |
| 1921                        | 329    | 1924     | 896.75 |
|                             | 1925   | 1,008.25 |        |

There was a further subsidence of the exchange in the early months of 1926 owing to the reduction in the grain exports for 1925. The decline in the external value of the lei was much greater than the decline in the internal purchasing power. Large stores of goods (British, French, Italian, Swiss) were sent to Rumania because of this difference of absorption at one period, with the result that the adverse balance was increased.

In 1921 a Government commission considered the question of the exchange. Many decrees were issued, and restrictions imposed, but they proved ineffective. M. Titulescu sought to bolster up the exchange by (1) new taxation, (2) Govt. control of the cereal harvest, and by holding a balance in Paris for purchase of lei offered at low prices. Early in 1923 a Rumanian delegation visited London and Manchester, and came to agreements with British private creditors on liabilities contracted by Rumanian traders since the War. An arrangement was also reached with French creditors.

In 1925 new decrees were issued. The restrictions on the export of wheat and barley were removed. An effort was made to stop inflation. The Rumanian budget had been balanced in 1922. Inflation for the purpose of balancing the budget was now declared to be illegal. The Treasury was to pay the National Debt by yearly instalments, to pay the 11 milliard lei owing to the National Bank by yearly instalments of about ¼ milliard lei, and the Bank was to buy gold with the State payments thus made to back the currency. Finally, the Bank was to have power to establish a Mint, and was granted the privilege of issuing currency for a period of 30 years. The capital of the State Bank was raised to 100,000,000 lei gold, to permit the participation of the State to the extent of 33,300,000 lei. The effectiveness of these steps is shown by the following budget estimates for the years 1924, 1925 and 1926:—

(In millions of lei)

|      | Revenue | Expenditure | Surplus |
|------|---------|-------------|---------|
| 1924 | 24,000  | 22,642      | 1,358   |
| 1925 | 31,750  | 31,750      |         |
| 1926 | 29,250  | 29,250      |         |

*Communications.*—A large part of Rumanian trade is carried on the Danube. The main communications of Rumania converge on Braila and Galatz. Rumania receives two-thirds of her imports from the industrial countries of Europe from the Danube river ports, and from those ports are loaded not only Rumanian produce, but the produce of other riparian States from Czechoslovakia downwards conveyed to these ports by river craft. Galatz is the principal port for timber export, Braila for cereals, vegetables, petroleum products, etc. Constanta is the only Rumanian port open all the year round. For the international régime of the Danube see DANUBE. The incorporation of the new provinces, whose communications were naturally directed chiefly to serve the States to which they formerly belonged, have made new railway communications essential to the development of Rumanian trade and industry. A new line from Oradiah Mare to Arad obviates a detour through Hungarian territory. New lines, the surveys for which were provided for by credits voted on July 7 1923, are Brasov-Neohias; Ilva-Mica-Vatra Dornei; Bum-besci-Livezeni; Hamangia-Tulcea. The first of these provides a direct route from Brasov to Constanta; the second will give a direct connection between the Bukovina and Transylvania; the third will traverse the Vulcan pass, and permit the easy transport of coal from Petrosani to Craiova. Other work in hand includes the transformation of the Bessarabian railways to the normal gauge and the proper linking up of Bessarabia with Danube ports. Before the War the outlet for Bessarabian produce was Odessa and a necessary condition for Bessarabian prosperity under the new conditions is the provision of an easy outlet from Danubian ports.

The railways would be adequately supplied with railway stock, locomotives and rolling stock having been taken over from the Central Powers, if repairing shop accommodation were sufficient. A large part of the reduction in export is due to the condition of the railways which delays the shipment of grain from the interior to the ports, and the development of Rumania depends to a considerable extent upon the improvement of her communications.

*BIBLIOGRAPHY.*—*Bulletin statistique de la Roumanie* (Bucharest, annual); Mitita Constantinescu, *L'évolution de la propriété rurale en Roumanie* (Bucharest, 1925); *Reports on Rumania* (British Dept. of Overseas Trade, London, annual); U. S. Dept. of Commerce, *Rumania, An Economic Handbook*.

**RUMANIAN LITERATURE** (see 23.844).—The revival of Rumanian literature dates back to about the middle of the 19th century, when, owing chiefly to the awakened interest in Percy's *Reliques*, the poet V. Alexandri published his collection of folk poems—*Ballades et chants populaires de la Roumanie* (1855).

This, together with the *Old Chronicles* (1845), edited by Michail Kogălniceanu, constituted a living monument of the vernacular. Their importance as an inspiring and stimulating power to the new writers was fully appreciated by Titu Maiorescu, who became the leading critical spirit in Rumanian letters.

Under Maiorescu's influence a group of national writers gathered round the newly founded periodical *Convorbiri Literare*. Among them were I. Creangă, who in *Aminiri din Copilărie* ("Recollections of Childhood") and other tales fresh with many idiomatic expressions embodied the spirit of the Moldavian peasantry; I. L. Caragiale, who, besides a realistic drama and two volumes of short stories and sketches of unsurpassed craftsmanship, showed in his comedies *Scrisoarea din Urmă* (The Lost Letter) and *Noaptea Furtunoasă* (Stormy Night) (*Collected Works*, 1908) the grotesque effect resulting from a hasty introduction of Western manners into a society still stamped with an oriental character; and above all the poet Eminescu. What a magic there was in his verse! The words linked together as by a strange chance, simple in appearance, but suggestive, suffused with emotion, creating a new music of their own, and apt to express—what had seemed impossible with a language as yet rather uncultivated—the highest thoughts that ever beset a great spirit. He has often been compared with Leopardi, on account of a profound, penetrating, overwhelming note of sadness, which affected all his successors, not excepting Al. Vlahutza, a poet with a strong individuality of his own. But there is another side to Eminescu—his broad conception of the Rumanian race. It was this that impressed writers of the later generation such as Prof. Iorga, who, in his *Istoria Literaturii Române în secolul al XVIII. lea, 1688–1821*, etc. (1901), arrived at a clearer understanding of what a national literature may be. In his own weekly, *Sămănătorul*, as well as in such other periodicals as *Convorbiri Literare*, under the editorship of Prof. Mehedinți, *Lucașărul* and *Viața Românească*, was first published almost all the modern writing which artistically reflects the deeper characteristics of the Rumanian people.

A corner of the humble life of Banat is described in Ión Popovici-Bănățeanu's short story, *In Lume* (Out in the Worlds); the romantic Vlach population scattered throughout the mountainous parts of Macedonia, Epirus and Thessaly is represented in Marcu Beza's volume of short stories *Pe Drumuri* (1914) (On the Roads) and his novel, *O Viață* (1921) (A Life). Transylvania has produced the poets G. Cosbuc, Octavian Goga, Stephen Josif. The first-named started a reaction against the pessimism of Eminescu by singing joyfully in rich cadences of everyday peasant life. Goga's poetry, being essentially of an irredentist character, has burned out its flame, its stirring power, in the realisation of national aspirations; but there are still in his second volume *Ne Cheamă Pământul* (The Land Calls On Us), a number of poems imbued with a deep, enduring humanity. He seems for the present lost to poetry, having turned his talent to the writing of vigorous, fiery leaders in his own weekly *Tara Noastră* (Our Country), the name of which speaks clearly of its tendency. To the gentle pen of Josif, a Transylvanian of Vlach paternity, are due the best renderings into Rumanian of Shakespeare's *Midsummer Night's Dream* and Shelley's *To a Skylark in Tălmăciri* (1923). It is from the English masters of song, chiefly from Keats, that another poet, P. Cerna, absorbed and made his own that power of soaring to the higher realms of imagination. His untimely death was a great loss to Rumanian literature, as in profundity he ranked next to Eminescu.

During this period public interest in Rumanian authors was awakened, so that even the national theatres of Bucharest, Jassy and other towns were able successfully to produce plays inspired directly by Rumanian history and folklore; such as Barbu Delavrancea's trilogy, *Apus de Soare, Lucașărul, Viforul*—Sunset, The Evening Star, The Storm—in which a strong Shakespearean influence could easily be detected. Victor Eftimiu's poetic excursion into fairyland, *Inșiră-te, mărgăritel*, 1911 (String Ye Pearls!) is founded on a popular Rumanian tale; so is Adrian Maniu's versified drama *Meșterul*, 1922 (The Masterbuilder).

Returning to fiction, one has to mention first of all I. Al.

Bratescu-Voinesti. In 1925 he was awarded the great prize of the Rumanian Academy, a well deserved recognition of his work, which, though small in output—comprising only two volumes of short stories, *In Lumea Dreptății* (In the World of Justice) (1908) and *In Tinerie și Lumină* (Darkness and Light) (1912) is remarkable for its delicate blending of humour and subdued pathos. Duiliu Zamfirescu in a series of three novels on *Din Viața Comaștilor* (The Life of Comaști) shows how the kind, God-fearing old boyar gradually disappears, and his place is taken by unscrupulous adventurers of no definite race or religion. Liviu Rebreanu's novel *Ion* (1921) deals with the peasants' love of the land, amounting sometimes to greediness, and fraught consequently with great calamities; it has rather impressed the public by its size, as it appeared in two large volumes, an unusual thing in Rumanian literature. Micheal Sadonuea is undoubtedly one of the most prolific writers. He published many books of short stories and narratives, his last, *Venea o Moară pe Siret* (1925) ("A Mill on the Siret"), being considered the best. It really gives a vivid insight into the countryside, and one meets now and again with masterly descriptions, which, however, through their profusion, overshadow in a way the movement of the characters. The World War does not seem to have either altered or much inspired literary production. An attempt to depict the general spirit during the German invasion of Rumania was made in a novel, called after the national colours, *Roșu, Galben și Albastru* (1925) ("Red, Yellow and Blue") by I. Minulescu, known as a disciple of the French symbolists. From the same school proceeded likewise a younger poet, Ion Pillat, who in his *Satul meu* (1925) ("My Village") manifests a definite return to the Rumanian tradition.

**RUNCIMAN, WALTER** (1870– ), British politician, was born at South Shields Nov. 19 1870, the son of Sir Walter Runciman, 1st Bart., a Newcastle shipowner. He was educated at Trinity College, Cambridge, and afterwards joined his father in his shipping business, being from 1896 to 1905 managing director of the Moor Line of cargo steamers. In 1898 he unsuccessfully contested Gravesend in the Liberal interest, but was elected for Oldham in 1899, although he only held the seat for a year. In 1902 he stood successfully for Dewsbury, and retained this seat until 1918. In 1905 he entered Sir Henry Campbell-Bannerman's Govt. as parliamentary secretary to the Local Govt. Board. He became financial secretary to the Treasury in 1907, president of the Board of Education in 1908, and was president of the Board of Agriculture from 1911 to 1914. From 1912–4 he was also Commissioner of Woods and Forests, and from 1914–6 president of the Board of Trade. On the formation of Mr. Lloyd George's Ministry in 1916 he retired from the Government. In 1920 he unsuccessfully contested North Edinburgh and in 1924 was returned for Swansea West. He was an active member of the Radical group formed within the Liberal party, and was thus opposed to the leadership of Mr. Lloyd George. (See LIBERAL PARTY.)

**RUNNING:** see ATHLETICS.

**RUPERT** (1869– ), German prince, the eldest son of King Louis III. of Bavaria, was born May 18 1869 at Munich. In 1906, after extensive travels in India and elsewhere, he was appointed to the command of the I. Bavarian Army Corps. At the outbreak of the World War he was commander of the Bavarian troops (the VI. German Army) and led them to victory in the great battles fought in Lorraine (Aug. 20–2 1914). In the following Oct. he was placed in command on the German front in Artois and southern Flanders, and, after having been advanced to the rank of field-marshal, was entrusted in the spring of 1917 with the chief command of the northern group of armies on the Western Front. In 1900 he married Marie Gabriele, a sister of the Queen of the Belgians; she died in 1912; and in 1921 he married Princess Mitonia of Luxembourg and Nassau.

Through his mother, the Archduchess Maria-Thérèse of Austria-Este, Prince Rupert was the descendant of the Stuart Kings of England and, according to legitimist ideas, in the succession to the British crown. (See *FRONTIERS, BATTLES OF THE.*)

**RURAL LIFE.**—During the period 1910–26 much has been done in Great Britain to bring to the villages some of the amenities of the town, also to arrest the depopulation of the rural districts.

*Women's Institutes.*—The Women's Institute movement came to Great Britain from Canada, where Women's Institutes had been in existence for some 25 years, and where their organisation promoted War-time economies and food production and preservation. Mrs. Alfred Watt, who had long been associated with the Canadian movement, had come to England in 1913 to interest Englishwomen in the movement. In Feb. 1915 the Agricultural Organisation Society realised its possibilities in rural England.

The first Women's Institute in Great Britain was founded in Wales at Llanfairpwll in Sept. 1915; the first in England at Wallisdown in Nov. of the same year. In Jan. 1925 there were 3,476 Women's Institutes in England and Wales, with a total membership of over 206,000, and the number was growing steadily. In 1917 the Board of Agriculture became responsible for the propaganda of the Women's Institute movement, as part of the work of the Women's Branch of the Food Production Department. In 1919 the Women's Institute became completely independent, though representatives of the Ministry of Agriculture continued to serve on its executive committee. The importance of the movement lies not so much in the fact that it has given country women a new interest in life, or even that it has set a remarkably high standard in handicraft, as that it has broken down much of the old isolation of village life.

Women's Institute members form a fellowship from which no woman is excluded by creed or politics, and the habit of meeting together monthly to discuss questions of interest to them as individuals and as members of the community is leading to a sense of the power of co-operation which seems likely to go far. Already certain institutes have taken up such questions as water supply, the preservation of footpaths, disposal of rubbish and housing; and on more than one occasion an intelligent district council has sent to the institutes for comment on the plans of cottages they were about to erect, so that the women who would do the work of those houses had a chance to express an opinion on them before they were built. A new sense of public service and a new spirit in local government are slowly making themselves felt which may do much to breathe new life into parish and district councils. Moreover, the linking together of village to village in groups and in county federations, and of county to county in the National Federation, bids fair to give a stability to this movement which has been lacking in previous efforts to develop the social, educational and recreational side of village life, excellent as many of these have been.

*Village Clubs.*—An attempt to do something of the same sort for men was made, after the War, by the Village Clubs Association, but did not prove successful. Certain parts of the work it had set before it were, however, being carried out by other organisations. Nothing was more striking after the War than the marked increase of interest in adult education (*q.v.*). An interesting experiment in linking together educational and social work from the elementary school to advanced classes for adults, and including the provision of playing fields, is at work under the auspices of the County Council at Sawston in Cambridgeshire.

*Rural Community Councils.*—A tentative effort to establish closer co-operation between the various statutory and voluntary agencies was made in Oxfordshire in 1920, when a rural community committee was formed, consisting of representatives of voluntary societies interested in educational and social development throughout the country, and of the County Council. Simultaneously, and independently, Nottinghamshire was beginning to move in the same direction. Since then rural community councils have been formed in Kent, Nottinghamshire, Derbyshire, Leicestershire, Gloucestershire, West Sussex, Hertfordshire, Cambridgeshire, Hampshire, Somerset, Forfarshire; and

other counties are in process of forming such bodies. These councils not only pool information, and as far as possible resources, thus enabling villages to obtain lectures, concerts, dramatic entertainments and other such things much more surely and economically than could otherwise be the case, but in certain cases they have taken active steps with regard to questions of public health and of rural industries. A further development has been the formation of village community councils on similar lines to the rural community councils. These do not in any sense replace the parish council, but aim at bringing together all sections of village life.

There has been a great increase in the number of village halls during the post-War period. Many have been put up as War memorials, and many have been provided by the village as a whole, not by individual donors. Boy Scouts, the Church Lads' Brigade and Young Farmers' Clubs are all attempting to deal with various aspects of the problem; but it remains to be seen if agriculture can provide adequate counter attractions to town life.

In music, drama and folk dance special efforts are made to cater for the intellectual needs of the villagers. Thanks to the enlightened policy of the Carnegie United Kingdom Trust, in every English county but two, rural libraries have been established, and visits from the village, country town and school concert parties, and from the Arts League of Service, bring music and drama to country audiences. Even more significant is the work of the English Folk Dance Society; the Village Drama Society and the music competition festivals, which are helping villagers themselves to develop artistic expression.

Wireless is in its infancy, and its influence in bringing isolated people into touch not only with music but with great national and political events through the broadcasting of speeches cannot yet be estimated. It undoubtedly suggests great possibilities which as yet are realised only to a very slight extent.

**RUSSELL, BERTRAND ARTHUR WILLIAM** (1872– ), British mathematician and philosopher, grandson of the first Earl Russell (Lord John Russell) and brother and heir of the second Earl Russell, was born at Chepstow, Monmouthshire, May 18 1872. He became a scholar, and subsequently a fellow, of Trinity College, Cambridge, and with peculiar lucidity propounded the theory of Neo-Realism. During the World War Mr. Russell twice infringed the emergency regulations, was for some time in prison, and was deprived of his fellowship in 1916. Thereafter he lectured and wrote on the major questions of metaphysics without the support of academic authority. He travelled through China and Bolshevik Russia and unsuccessfully contested the Chelsea constituency in the Labour interests. His most important works are: *Principles of Mathematics* (1903); *Principia Mathematica*, in which Prof. A. N. Whitehead collaborated (1910); *Mysticism and Logic* (1918); *The Analysis of Mind* (1921); and two books of popular exposition, namely the *A. B. C. of Atoms* (1923) and the *A. B. C. of Relativity* (1925).

Mr. Russell has been peculiarly successful in eliciting from contemporary physics those theorems that are most nearly consonant with his temper. He began by trying to impose upon psychological and metaphysical speculation the orderly logic of pure mathematics. As time went on, he came to despair of a successful issue, and in his later work admits that neither materialism nor idealism can wholly satisfy him. He has therefore tried to formulate a neo-realism, the substance of which is the existence of some primary stuff neither mental nor material. But

temperamentally he is a desperate man, loving extremes, and too many of his speculations are deliberately intended "à l'égard les bourgeois." His works on Russia *The Practice and Theory of Bolshevism* (1920) and China, *The Problem of China* (1922) deepen the impression made by his works on general philosophy. He is, essentially, an intellectual, who believes that the truth may be acquired by well disciplined ratiocination, but does not believe that the Governments of the world, whether despotic or democratic, will ever attain to the perception of truth. Therefore he is a deliberately lonely figure, almost querulously criticising the world's workings, ever ready to champion unpopular causes, slow in accepting any "fait accompli." He has with some justice been called a Huxley who has not found his Darwin. In collaboration with his second wife, Dora, daughter of Sir F. W. Black, he wrote *The Prospects of Industrial Civilization*, 1923. (See KNOWLEDGE, THEORY OF; RELATIVITY.) (H. C. HA.)

**RUSSELL, GEORGE WILLIAM** (1867– ), Irish writer and painter, known as *Æ*, was born at Lurgan, Co. Armagh, April 10 1867. Educated at Rathmines School, Dublin, he entered an accountant's office, but in 1897 joined the Irish Agricultural Organisation Society, and became an organiser of agricultural societies. From 1904 to 1923 he was editor of *The Irish Homestead*, the organ of the agricultural co-operative movement in Ireland. In 1923 he was appointed editor of *The Irish Statesman*, which post he still held in 1926.

Russell's publications include *Homeward: Songs by the Way* (1894); *The Earth Breath* (1897); *Literary Ideals in Ireland* (1899), a collection of essays written in collaboration with W. B. Yeats, W. Larminie and John Eglington; *Ideals in Ireland* (1901), another book of collaborative essays; *The Nuts of Knowledge* (1903), a selection of lyrics. In 1904 appeared two books of verse, the *Divine Vision* and *New Poems*, an anthology of verses by young Irish poets; and a collection of mystical tales, *The Mask of Apollo*. Other books of verse include *By Still Waters* (1906), *Collected Poems* (1913), and *Gods of War* (1915). *The Hero in Man* (1909) and *The Renewal of Youth* (1911) were imaginative musings, as was *Imaginations and Reveries* (1915). In 1906 appeared *Some Irish Essays*, and in 1907 *Deirdre*, a three-act play. *Co-operation and Nationality* and *The Rural Community*, published in 1912 and 1913 respectively, were pamphlets embodying co-operative ideals, which are further developed in his *The National Being: Thoughts on an Irish Polity* (1917). *The Candle of Vision*, an attempt to discover the element of truth in the mystical imagination, appeared in 1918. This was followed by *The Interpreters* (1920), a symposium in the Platonic fashion in which world politics are related to motions in the *anima mundi*. A volume of poems, *Voices of the Stones*, appeared in 1925.

**RUSSELL, ISRAEL COOK** (1852–1906), American geologist (see 23.862), died at Ann Arbor, Mich., May 1 1906.

**RUSSELL, WILLIAM CLARK** (1844–1911), British author (see 23.863), died at Bath Nov. 8 1911.

**RUSSIA** (see 23.869), now officially known as the Union of Socialist Soviet Republics (U.S.S.R.) The territory of Russia just before the War consisted of about 22,000,000 sq. km., 25.4% of which lay in Europe, 74.6% in Asia. The War reduced Russian territory in Europe, partly by adding parts of it to existing States, but more especially by the creation of new States out of the territory of the former Russian Empire. As a consequence of the separation of Finland the formation of Estonia, Latvia, Lithuania, Poland, the absorption by Turkey of the pashalik of Kars and the occupation of Bessarabia by Rumania, Russia lost 804,000 square kilometres. The whole territory of the Union of Soviet Socialist Republics is now about 21,200,000 sq. km. (8,108,387 sq. m.) with a population of 139,700,000. (For Asiatic Russia see SIBERIA.)

The Union of Soviet Socialist Republics (U.S.S.R.) according to the constitution of 1923 and subsequent additions, consists of six independent republics as follows: the Russian Soviet Federal Socialist Republic (19,700,000 sq. km.), the Ukrainian S. S. Republic (400,000 sq. km.), the White Russian S. S. Republic (100,000 sq. km.), the Transcaucasian Soviet Federal Socialist

Republic (200,000 sq. km.), the Turkoman Soviet Socialist Republic (200,000 sq. km.) and the Uzbek Soviet Socialist Republic (331,900 sq. km.). Some of these are again federations in their turn.

## I. DIVISIONS OF THE SOVIET UNION

The following is a complete list of the territorial divisions of the U.S.S.R. with their capitals as they existed in 1926.

### THE WHITE RUSSIAN SOVIET SOCIALIST REPUBLIC CAPITAL—MINSK

| Province | Administrative Centre | Province  | Administrative Centre |
|----------|-----------------------|-----------|-----------------------|
| Minsk    | Minsk                 | Mogilev   | Mogilev               |
| Slutsk   | Slutsk                | Kalininsk | Klimovich             |
| Mozir    | Mozir                 | Orsha     | Orsha                 |
| Bobruisk | Bobruisk              | Vitebsk   | Vitebsk               |
| Borisov  | Borisov               | Polotsk   | Polotsk               |

### TRANSCAUCASIAN SOCIALIST FEDERAL SOVIET REPUBLIC CAPITAL—TIFLIS

| Constituent Republics                     | Capital     |
|-------------------------------------------|-------------|
| 1. Azerbaijan Soviet Socialist Republic   | Baku        |
| (a) Nakhichevan area                      | Nakhichevan |
| (b) Nagoini Karabakh                      | Khan-Kendi  |
| 2. Armenian Soviet Socialist Republic     | Erivan      |
| 3. Georgian Soviet Socialist Republic     | Tiflis      |
| (a) Abkhazian (autonomous Republic)       | Sukhum      |
| (b) Adjarian (autonomous Republic)        | Batum       |
| (c) Southern Ossetian (autonomous region) | Tskhinvali  |

### RUSSIAN SOCIALIST FEDERAL SOVIET REPUBLIC

| Province                               | Capital                  |
|----------------------------------------|--------------------------|
| Altai                                  | Barnaul                  |
| Amur                                   | Blagoveschensk           |
| Archangel                              | Archangel                |
| Astrakhan                              | Astrakhan                |
| Bryansk                                | Bryansk                  |
| Vladimir                               | Vladimir                 |
| Vologda                                | Vologda                  |
| Voronej                                | Voronej                  |
| Vyatka                                 | Vyatka                   |
| Gomel                                  | Gomel                    |
| Grozni (a town with Provincial Status) |                          |
| Yenisei                                | Krasnoyarsk              |
| Transbaikai                            | Chita                    |
| Ivanovo-Voznesensk                     | Ivanovo-Voznesensk       |
| Irkutsk                                | Irkutsk                  |
| Kaluga                                 | Kaluga                   |
| Kamchatka                              | Petropavlovsk-Kamchatski |
| Kostroma                               | Kostroma                 |
| Kursk                                  | Kursk                    |
| Leningrad                              | Leningrad                |
| Moscow                                 | Moscow                   |
| Murmansk                               | Murmansk                 |
| Nijegorod                              | Nijni-Novgorod           |
| Novgorod                               | Novgorod                 |
| Novo-Nikolaevsk                        | Novo-Nikolaevsk          |
| Omsk                                   | Omsk                     |
| Orlovsk                                | Orel                     |
| Penza                                  | Penza                    |
| Perm                                   | Perm                     |
| Primorsk                               | Vladivostok              |
| Pskov                                  | Pskov                    |
| Ryazan                                 | Ryazan                   |
| Samara                                 | Samara                   |
| Saratov                                | Saratov                  |
| Sverdlovsk                             | Sverdlovsk               |
| Severo-Dvinsk                          | Veliki-Ustyug            |
| Severo-Kavkaz (Region)                 | Rostov-on-Don            |
| Smolensk                               | Smolensk                 |
| Tambov                                 | Tambov                   |
| Tver                                   | Tver                     |
| Tomsk                                  | Tomsk                    |
| Tula                                   | Tula                     |

## II. HISTORY TO THE REVOLUTION

*The Last Years of Tsardom.*—The transition from an autocratic to a constitutional régime was rendered especially difficult in Russia by the lack of political education among the people, the doctrinaire fanaticism of the intellectual leaders and the selfishness of the Government. The First Duma had ended in a vain attempt to appeal to the country against the Government.

The Stolypin Ministry, which was formed in 1906, started with a programme of co-operation between the Government and "leaders of public opinion," and it sought an agreement with the more moderate sections of Liberals, especially with the Octobrists, the supporters of a policy aiming at putting into practice the manifesto of Oct. 1905. The failure of this attempt is a fact of historical importance in so far as it showed conclusively how irreconcilable the tendencies of the imperial bureaucracy were with the programme of moderate Liberalism. P. A. Stolypin

was as fine a representative of Old Russia as the governing class of the time could muster—not a great statesman nor an original thinker, but a fearless, patriotic gentleman with practical experience in provincial administration, accessible to ideas of reform, but constitutionally adverse to radical theories.

The repression of revolutionary attempts and of agrarian revolts was taken in hand with ruthless energy, and it succeeded in driving discontent underground and in re-establishing external order, but it cast its shadow on the constructive work of Stolypin's statesmanship. After the clash with the intractable Second Duma the electoral system was altered by the manifesto of June 3 1907.

This *coup d'état* secured to the Government a numerical majority in the Third and in the Fourth Dumas, while at the same time it weakened the moral authority of these assemblies and made the Moderates more susceptible to the appeals of the Lefts.

In spite of the outward pacification of the country there was no real settlement, and the flames of political passion burst out occasionally with ominous violence. The close of 1910 was marked by an increased agitation among the students—the most sensitive and audacious element of Russian society. Harrowing tales of flogging and tortures practised on political convicts in the prisons of the North and of Siberia had reached the educational centres, and a series of strikes and indignation meetings began in all the various high schools of the empire. The reactionary bureaucrats, however, with M. Kasso, the Minister of Public Instruction, at their head, decided to use these sad occurrences in order to overthrow the self-government of the universities, conceded to these institutions by the Imperial *ukaz* of Aug. 27 1905. M. Kasso issued decrees ordering the establishment of a strict régime of official inspection, the closing of students' unions and societies with the exception of the scientific ones, and, eventually, the direct interference of the police for the maintenance of order within the universities and high schools. In Moscow the Rector (Prof. Maniulov) and his assistants declared that they could not assume responsibility for the carrying into effect of the ministerial measures; they were deprived of their chairs; 63 professors and lecturers tendered their resignations as a mark of sympathy with their dismissed comrades. This did not disturb the minister in the least, and he promptly accepted most of the resignations, although this involved the intellectual ruin of the oldest and most famous university of Russia. The "Pride's Purge" in Moscow was followed by a number of dismissals in other educational establishments. The unsparing scourging of the academic corporations produced the desired effect of outward submission, but it brought the feelings of hatred and humiliation among the intellectuals to the highest pitch, and the outcasts and convicts of the university "stories" afterwards formed the principal contingent among the embittered intellectual leaders of the revolution.

Another sign of the times may be discerned in Stolypin's legislation in respect of the *Zemstvos* of the western provinces (Kiev, Volhynia, Podolia, Mogilev, Minsk and Vitebsk). The introduction of a measure of local self-government would have been in itself a boon to the population of these provinces, but Stolypin made it an occasion for a renewed humiliation of the non-Russian nationalities, strongly represented in these districts. The project of the Government disfranchised the numerous Jewish population, and drove the Poles into a position of inferiority by dividing the electorate according to national colleges and establishing beforehand the preponderance of the Russian colleges by means of an artificial scheme of repartition. The unfairness and political short-sightedness of these restrictions provoked a strong opposition even in the docile Third Duma.

In the Council of the Empire a coalition between the Rights and the Lefts led to the rejection of the bill. Stolypin did not submit in the face of such an assertion of independence. He prorogued the Duma for three days (May 14-17); and in the interval obtained an Imperial decree promulgating the law as an emergency measure on the strength of Art. 87 of the Organic Laws. In consequence of this snub administered to the Legislative Assemblies, the Octobrist Centre could no longer support

the Government; the leader of the Octobrists, A. Guchkov, resigned the presidency of the Duma, and votes of censure on the Government were passed in both Houses on the resumption of their sittings. Stolypin's position was made untenable by these events. His victories meant in truth the breakdown of his programme. The Premier had again to rely exclusively on the goodwill of the autocratic Tsar as against independent public opinion, and he had to strive for that goodwill in the enervating and treacherous surroundings of Court intrigue, in which obsequious chamberlains were more expert and successful than himself.

The *coup de grâce* came from the midst of the secret police, that had become the mainstay of the Imperial system in its struggle against growing rebellion. One of the agents of this organisation, Bogrov, inflicted a mortal wound on Stolypin at a gala performance in the Kiev Opera House on Sept. 14 1911. The hatred of oppressed nationalities and of the humiliated intellectual class had armed the hand of the assassin, who was a well-educated Jew.

#### THE AGRARIAN QUESTION

*The Stolypin Land Reforms.*—One part of Stolypin's activity calls for special examination, his land reform, which may be considered as the immediate introduction to the social revolution of 1917. The agrarian revolts of 1905 attracted the attention of the Government and of society to the deplorable condition of the most numerous and important social class, the peasantry. The causes of the growing impoverishment of the peasantry are to be sought primarily in the manner in which the emancipation of 1861 had been carried out. The plots of land (*nadel*) which the peasants got varied greatly in size in different provinces. "Large" holdings ranged between  $2\frac{3}{4}$  (about eight ac.) and 12 dess. (33 ac.), while minimum holdings corresponded to one-half of the maximum ones. The landowner's share comprised, besides his domain land, from one-third to one-half of the land formerly occupied by the peasants, on the condition that the latter should receive no less than the minimum holding. Besides these two principal types of holdings the Emancipation Act of 1861 established also the "beggarly" or "gratuitous" holding, which was to be no less than one-quarter of the maximum one. The gratuitous holding was established by free agreement between the peasants and the landowner; in this case the peasants had to pay no redemption while the landowner kept all the rest of his land. On the whole the quantity of land held by the peasants had been much reduced from that held before emancipation.

The following figures for the province of Saratoff may serve as an illustration:—

In 1861 688,826 peasants received beggarly holdings; they held 502,383 dessiatines. In 35 provinces 921,826 souls<sup>1</sup> were assigned one-half of the large holding each and held 1,530,000, or less than two dessiatines per soul.

The peasants' holdings, which were already whittled down at the time of the Emancipation, were further reduced after it by the increase of the population. A Commission for the investigation of the conditions and needs of the peasantry described the diminution of the peasants' holdings in the following manner: in 1860, 4.8% decrease on the average; in 1880, 3.5% decrease and in 1900 2.6% decrease. Besides losing a portion of the arable land, the peasant lost at the Emancipation the right of using the landowner's pasturage, of cutting wood in his forest; and some other subsidiary rights important in the living of peasant farmers.

The redemption payments were a heavy charge on the peasant's budget. The Agricultural Commission of 1872 found that squires had to spend on taxes less than 14.5 kopecks per dess., while the peasants paid more than 95.5 k. per dessiatine. In addition, the peasants had to pay the poll-tax, the amount of which was about 4r. 45k. per soul. The same Commission states that in 37 provinces the taxes and redemption payments of the meferr State and appanage peasants comprised 92.75% of their net income from land, the payments of former unfree peasants

<sup>1</sup> Persons doing the normal work of a villager.

198.25%. The Government made some futile attempts to relieve the peasants' load of taxes. The salt tax was abolished in 1880, the poll-tax in 1882. But these measures could certainly not solve the financial difficulties of the peasantry. Arrears grew rapidly to enormous proportions. In the province of Tambou, for example, the arrears amounted in 1898 to 244% of the original charge.

Driven by land hunger, the peasants farmed on lease a large part of the State's appanages and of squires' land, but this expedient cannot be considered as an effective help in the solution of the land problem. The rent paid by the peasants to the landowners was usually very high. It is important to notice that certain plots of land, the use and possession of which was an essential necessity for the whole community, for example strips bordering on watercourses remained usually after the Emancipation in the hand of the landowner. This gave him the power to require exorbitant rent for such land and keep the peasants in permanent fear of losing these grounds, without which village life was practically impossible. This led to continual collisions. Under such conditions the backward and extensive methods of peasant cultivation proved very difficult to reform.

One of the most important defects of the peasants' landholding was the intermixture of strips in the open fields. The land of a community lay only seldom in a compact block. It was usually divided into a number of smaller "shots," sometimes mixed up with lands of other villages and landowners. The blocks of land belonging to the same community were again subdivided into strips, which were sometimes two to three yd. broad and some 100 yd. long. Each household held a certain number of strips 20-30-50, sometimes even 100-150. The strips were scattered at a great distance from the farmyard, and the driving to them entailed a considerable waste of time and work; this hampered greatly the farming arrangements of the villagers. The intermixture of strips separated from each other only by narrow balks obliged the whole community to follow the same system of cultivation, which was usually the three-fields one. The very large extent of fallow land, the carelessness of the holders who were not sure of keeping their land permanently—all this had the most ruinous effect on the peasants' farming. Under such conditions, hampering individual energy and initiative, productivity on the peasants' holdings was very low indeed. In 27 provinces the average value of the gross produce of one dessiatine of peasants' land was 8r. 99k., while the average cost of production per dess. was 5r. 22k.; so that the net produce per dess. amounted only to 3r. 77 kopecks. The productiveness of the squires' estate was 12-18% higher than that of the peasants, but as a large area of landowners' land was taken on lease by the peasants, the difference in the results of cultivation would be much greater.

*Decay of the Peasantry.*—The impoverishment of the peasantry after the emancipation of 1861 is reflected in a memoir of the Zemstvo of Tula:—

The peasant's life is hard and unsightly even in periods of comparative welfare. Generally he lives in a cottage of 8-9 yd. width and no more than 3 yd. in height. Cottages without chimneys are still very common, the smoke being let out through a hole in the roof. The roof is almost always thatched. In many provinces the walls are covered with dung for the sake of warmth. A peasant's family, sometimes a numerous one, is huddled together in a space of 20-30 sq. yards. The floor of the cottage is almost always bare soil, because lambs, calves, pigs and even cows are put in during the cold weather. Skin diseases are very common among the population. Meat, bacon, oil, butter appear on the peasant's table only on exceptional occasions, perhaps two or three times a year; his usual fare is composed of bread, porridge, kvass, cabbage and onions.

A very characteristic symptom of the decay of the peasants' farming is the reduction of the number of horses and the increase in the numbers of horseless households. A comparison of the figures of the horse statistics in 1888 and 1893-4 shows that in 31 provinces the number of horses had fallen by 10.88%. The number of horseless households had increased during the same period in 23 provinces of central Russia from 21.56% to 26.85%. More than 25% of the households have no horses at all; another 25% have only one horse each.

Let us now examine a peasant's normal budget as it is presented in the remarkable work of Mr. F. A. Shcherbina (edited by Prof. A. J. Chuprov):—

|                        |             |
|------------------------|-------------|
| Income from:—          |             |
| Corn on his land       | 16 r. 20 k. |
| Corn on household land | 1 r. 92 k.  |
| Straw and hay          | 8 r. 16 k.  |
| Gardening              | 2 r. 63 k.  |
| Cattle-breeding        | 9 r. 99 k.  |
| Trade or craft         | 8 r. 47 k.  |
| Sundries               | 7 r. 26 k.  |
| Total                  | 55 r. 63 k. |
| Expenses:—             |             |
| Corn                   | 18 r. 10 k. |
| Food for cattle        | 8 r. 45 k.  |
| Vegetables and fruit   | 1 r. 30 k.  |
| Meat                   | 3 r. 90 k.  |
| Rent                   | 1 r. 2 k.   |
| Taxes                  | 2 r. 65 k.  |
| Sundries               | 20 r. 10 k. |
| Total                  | 55 r. 54 k. |

Assuming that 19 poods of corn per head are the minimum necessary during one year and that 7·5 poods are sufficient for fodder, Mr. Maress calculated that 70·7% of the peasant population had less than 19 poods per head, 20·4% had between 19 and 26·5 poods per head, and only 8·9% had more than 26·5 poods per head. This means that 70·7% of the farming population could not live on the income from their land and would be reduced to semi-starvation if they could not find any supplementary means of existence.

The state of mind produced by this situation among the peasantry may be gathered from the opinions expressed by peasant deputies in the Second Duma in the course of the debates on agrarian reform. One of the members of the Right, Prince Sviatopolk Mirski, had said that the ignorant and inexperienced mass of the Russian people had to be guided by the landlords as a flock is guided by shepherds. Kisselev, a peasant belonging to the group of toil, replied:—

"We have had enough of that kind of thing! What we want are not shepherds, but leaders, and we know how to find them without your help. With them we shall find our way to light, to truth, to the promised land!"

Afanassiev, a non-party deputy, an ex-soldier, said among other things:—

"In the Japanese war I led a number of mobilised soldiers through estates (of the squires). It took us 48 hours to reach the meeting place. The soldiers asked me, 'Where do you lead us?' 'To Japan.' 'What for?' 'To defend our country.' They replied: 'What is that country? We have been through the estates of the Lisetskys, the Besulovs, the Padkopailovs . . . Where is our land? Nothing here belongs to us.'"

The same deputy said on another occasion:—

"Work, sweat and use the land! But if you do not wish to live on the land, to till it, to work on it, you have no right to own it!"

In order to meet this disastrous situation the Government made attempts in three directions—the increase of the size of peasants' holdings, emigration and the improvement of agricultural methods. It would be erroneous to think that the deficiency in land could be entirely removed by new distributions from the estates of the squires and the domains of the Crown. In 1906 the distribution of land among different classes of land owners was as follows (*La Réforme agraire en Russie*, Ministère de l'Agriculture, 1912):—

|                                                         |                   |
|---------------------------------------------------------|-------------------|
| Crown land                                              | 133,038,883 dess. |
| Peasants' holdings                                      | 119,067,754 dess. |
| Land bought by communities and associations of peasants | 11,142,560 dess.  |
| Land bought by individual peasants                      | 12,944,154 dess.  |
| Land of the gentry                                      | 49,287,886 dess.  |
| Land owned by other classes                             | 22,664,493 dess.  |
| Land owned by various institutions                      | 6,985,893 dess.   |

The enormous area of the Crown lands was mainly covered by forests or situated in the northern and eastern provinces, so that it could not be used for agricultural purposes; the surface of convenient land in the hands of the Crown was only about 3,700,000 dessiatines. The arable land owned by the Church and different ecclesiastical institutions amounted to 1,672,000 dess. (Statistics

of the Holy Synod, 1890); the appanages comprised 2,000,000 dess. of arable land. As a large part of the land was covered also by forests, we come to estimate the surface of the arable land owned by squires at about 35,000,000 dess. (Yermolov.) The sum total that could be disposed of would thus amount to 45,000,000 dess., or about 30% of the area of the peasants' holdings; divided among the villagers it would have made less than one additional dessiatine per soul. The insufficiency of the land reserve becomes even more evident if we keep in mind that about 85% of the arable land of the Crown, 90% of the appanage arable land and a considerable part of the squires' land were already leased by the peasantry.

The peasants' revolt of 1905 and the new schemes of Stolypin gave an entirely new direction to the agrarian policy of the State. The Manifesto of Nov. 3 1905 suspended all redeeming payments after Jan. 1 1906. Of the surface of 2,846,620 dess., which the bank sold directly from Jan. 1 1906 to June 1 1913, peasants' communities got 5·5%, peasants' associations 14·8%, individual owners 79·7%. The peasants also acquired from the landowners, with some assistance of the bank, 4,375,163 dessiatine. It is estimated by Oganovsky that the result of the bank activity until July 1 1910 was the creation of 45,000 to 50,000 separate farms and of 130,000 to 140,000 small compact plots, the owners of which live in hamlets.

The law of 1889 had subjected emigration to official supervision. Those were allowed to emigrate who were able to pay the expenses of the journey and of the installation of a new household, provided their departure did not harm the remaining members of the community. No government assistance was given to the emigrants. Permission to emigrate was refused if the local authorities considered that the emigrants could find work in the old district. Those who emigrated without an official permission had to be sent back. These regulations resulted in a great reduction of the emigration movement, which was practically closed to the poorest peasants.

The events of 1905 and the new orientation of the government brought a great change in the emigration policy. Greater facilities were granted, and government assistance was promised by the Provisional Rules of June 6 1906. But the growth of emigration which followed the new regulations was obstructed by a complete lack of organisation.

We have now to consider the third branch of the government activity, directed towards the solution of the agrarian question. The scheme for improving agricultural methods was based on a reform of the distribution of the land. In 1861 a legal confirmation of the peasants' customary commune was considered the best means to secure the return of the money advanced by the State for redemption. The statistics of landownership in 1905 showed that 23·2% of the households and 17% of the land owned by the peasants were held by private tenure; 76·8% of the farms and 82·7% of the peasants' land were in communal tenure. The right of property was attributed not to separate households but to the whole village community, as a juridical person. In the case of communal land tenure only the house close belonged to households in permanent tenure; other land belonged to the whole community, and was subject to occasional redistributions. Former domestic servants were assigned to peasants' communities, but did not obtain holdings; they formed in this way a village proletariat.

In the reign of Alexander III. communal tenure, which had been regulated by the Liberation Act of 1861, came to be regarded as a political safeguard, and its decay was considered to be a national danger. The law of Dec. 14 1893 made practically impossible any transition from communal to household tenure. But the growing impoverishment of the peasantry gave evidence that the existing land system had ceased to be beneficial. The special conference established by an Imperial Order on Jan. 22 1902 recognised for the first time the necessity of a fundamental change in the existing land settlement of the peasants. The majority of the Conference were of the opinion that the communal tenure and the intermixture of strips were the chief causes of the alarming condition of the peasantry.

*Stolypin's Land Settlement.*—The agrarian disorders of 1906 gave increased importance to the problem, and proved that the settlement of it could not be postponed any longer. In the years 1906–7 the problem of land reform excited the strongest interest in governmental circles, and played a most prominent part in the programmes of different parties and in the debates of the First and Second Duma. Stolypin took the initiative on the part of the government and eventually obtained the support of the Third Duma. His scheme had a political purpose, the creation of a conservative class of small peasant owners who could be counted upon to defend the existing régime. This class had to be strong and progressive economically, as it was clear that the improvement of the peasants' condition could be attained only by more intensive farming. Some measures had been taken to enlarge the area of the peasants' holdings without violating the interests of the squires. But government activity was principally directed to a complete reconstruction of relations inside the village, to the creation of separate farms and to the spread of individual ownership. The Imperial *ukase* of Nov. 9 1906, the Land law of June 14 1910 and the Agricultural law of May 29 1911 were enacted for this purpose. The features of Stolypin's scheme were: Each householder possessed of land in a village community can demand that his land should be constituted a plot in individual property. A simple majority of the village assembly may convert holdings into privately owned land. The land has to be assigned to the claimant, if possible, in a single block. The conversion of the land of the entire community can be decreed by a resolution of the village meeting passed by a simple majority of the members. All the communities where there had not been any redivision of land since 1861 were declared to have passed from communal tenure to individual or household ownership. Formation of compact plots could not be refused if it was asked for by not less than one-fifth of the householders. The Land Commissions created by the *ukaz* of March 4 1906 were entrusted with the redistribution of land under the new land settlement.

In the Duma the Right clung to the opinions which had been prevalent in the time of Alexander III.; the Radicals entertained the hope that the communal land tenure might form the cradle of future collectivism. The Cadets mostly agreed with the principles of the government scheme, but they objected to the coercive character of its methods. The majority of the House supported the government and carried its bill through the Duma. The motives that influenced the deputies of the Duma were well expressed by the chairman of the Land Committee, S. Shidlovsky, in his speech on Oct. 23 1908:—

Our attitude as regards the decree of Nov. 9 is in substance a favourable one, because this decree aims at the development of individual land tenure and individual land tenure is certainly the necessary condition of improved cultivation, and the latter means the solution of the agrarian problem. . . . The foundation of a State ruled by law consists in a free, independent and energetic personality. Such a personality cannot exist unless you allow the common right of ownership, and no one who wishes the State to be ruled by law should oppose the spread of private property in land. Land is, after all, only a basis for the application of labour and capital, and labour is most productive when the labourer is placed in favourable conditions. In the forefront in this respect we have to place an open door for personal enterprise, free play for creative energy, security against outside interference, personal interest. . . . The avenue towards a permanent improvement in the existence of our peasants is to be found in an immediate increase of production and income from land, and this cannot be achieved without the help of outside capital. . . . A law which opens the way to personal property enables the agricultural worker to display his creative force.

The reform had apparently achieved an immediate and striking success. Before Jan. 1 1913 the Commission had arranged farms on an area of 7,413,064 dess., held by 738,980 households; strips had been concentrated into blocks on an area of 4,359,537 dess., held by 585,571 households, yet most of those who asked for separation held only a small plot, and belonged to the poorer peasantry. Even with government assistance they were unable to start separate farms, as this undertaking involves in the beginning a considerable outlay of capital. Besides, the natural conditions in some parts of Russia were not favourable to sepa-

rate farms or homesteads. One of the chief difficulties was the lack of water, which in very large tracts of the black soil area can only be found in connection with considerable rivers. This fact, together with the traditional leaning of the peasantry to village life, obliged the Land Commission to keep up on many occasions the village system even after the concentration of the fields.

A memoir drawn up by the conference of Old Ritualists held at Moscow on Feb. 22–25 1906 discloses the views taken by the peasantry on the question of communal land tenure. The opponents of the commune suggested that it made impossible any improvements in agricultural methods and diminished the productive power of the soil; its supporters stated that communal tenure was the only system based on justice; this consideration is characteristic of the traditional feeling among the Great Russians. The government scheme sacrificed justice for the sake of expected increased production. Stolypin himself described the new land settlement as "a stake on the strong."

The small size of the holdings of the new farmers and their economic helplessness had, however, a very unfavourable influence on the expected increase of production. A farmer who held only 8–10 dess. of land could not introduce any extensive improvements in his household in the absence of cheap credit. Stolypin recognised that "primitive methods were used by the peasantry as before."

The land settlement of 1906–10 was carried out with uncommon energy, but the social needs of the population were not satisfied. The government was accused of having destroyed by a stroke of the pen an institution formed by centuries. The sudden change affected not only the economic conditions of the peasants' life, but the juridical relations between the members of the family were also shaken. Before the new settlement the life of the peasants was based on the participation in the common holding of all the members of the household. The new law substituted for this family tenure the individual ownership of the chief householder. All the other members of the family suddenly lost their rights in the land.

Altogether it may be said that Stolypin's agrarian measures could take effect only if they were accompanied by a steady policy making for agricultural education and backed by extensive credit. Even in such a case a long time would have been necessary to enable them to strike root. Their immediate consequence was rather to increase the fermentation in the villages and to excite and embitter the feelings of those who were losing faith in the village community without acquiring any other standard of economic organisation. Thus the legislation of 1906–11 helped to prepare the agrarian upheaval instead of preventing it.

#### THE STRUGGLE FOR REFORM

*The Third and Fourth Duma.*—The death of Stolypin left a wide gap in the ranks of the government, and the appointment of M. Kokovtsov, the Minister of Finance, to the premiership did not result in a rejuvenation of the bureaucratic system. The new Premier was in favour of continuity in policy; this meant that he wanted to keep on the lines traced by Stolypin's initiative and avoid new departures as far as possible. He was a trained administrator, placed by chance at the head of the country in a time when caution and routine were certainly insufficient to meet the requirements of a critical situation. The principal achievement of the three years of Kokovtsov's rule was apparent success in the management of financial operations. The budget grew every year and reached in 1914 the enormous sum of three milliard roubles, and yet not only was a deficit avoided, but some 1,500 millions in gold were accumulated as a reserve fund to sustain the currency and meet possible emergency calls.

The instability of the vast structure buttressed on the chronic alcoholism of the people was duly perceived by public opinion, and a campaign was started in the Duma to put an end to this shameful and perilous situation. One of the Duma members, Chelyshv, was the soul of an active agitation in the Legislative Assemblies and in government circles. He succeeded in obtaining the formation of a commission to examine and report on the

subject, but his abolitionist plans were obstructed by the opposition of the Finance Ministry, which did not see its way to balance the budget without the resources supplied by the monopoly of the sale of spirits.

Yet signs were not wanting that the welfare of the country was seriously threatened, in spite of an enormous and duly balanced budget. The harvest of 1911 was so poor that in 1912 Russia was visited by a severe famine. Yet the government refused to let voluntary organisations assist in fighting the disaster; only associations affiliated to the Red Cross or to the Zemstvos were allowed to send agents into the provinces, to collect and to distribute funds. The public works organised by bureaucratic boards were conducted in a very unsatisfactory manner. Some progress was made in connection with insurance against ill-health, but in other respects the employers were left very much to their own way, with the result that strikes, which had decreased considerably in number and intensity after the collapse of the revolutionary movement in 1907, began to multiply again. On many occasions the unrest was quelled by the intervention of Cossacks and soldiers. The most terrible case of the kind occurred in the goldfields of a company largely supported by foreign capital—the Lena Company; a dispute as to wages and maintenance was terminated by a fusillade in which 162 workmen were killed.

The Third Duma had been led by the Octobrist party in conjunction with the moderate Right. This policy had suffered shipwreck through the absolutist bent of Stolypin's administration and the colourless leadership of Kokovtsov. In the last sessions before its dissolution the Duma assumed a frankly hostile attitude towards the Ministry and the leader of the Octobrists, A. Guchkov, pronounced thundering indictments against the "irresponsible influences" which shaped the course of politics from behind the scenes: the egregious mismanagement of the Artillery Department, presided over by the Grand Duke Serge Mikhailovich, and the scandalous influence of the Empress's protégé Rasputin, gave good grounds for these attacks. On the dissolution of the Third Duma the intricate and restricted franchise provided convenient handles for the gerrymandering of elections, and the Government made full use of them in order to secure a Government majority in the Fourth Duma.

*The Fourth Duma.*—The bureaucracy and the priests mobilised by the Procurator of the Holy Synod were so far successful in this campaign that, thanks to its pressure and to the evident breakdown of the plan of a coalition with the Government, the Octobrists were defeated in a number of districts and their leader, Guchkov, succumbed at the polls.

The party grouping may be tabulated as follows: (1) The Right, 67; (2) Moderate Right, 38; (3) Nationalists, 55; (4) Centre (Krupensky's group), 28; (5) Octobrists, 87; (6) Progressists, 37; (7) Constitutional Democrats, 60; (8) Social Democrats, 14; (9) Polish circle, 13; (10) Mahomedans, 6; (11) No party, 20; (12) Group of Toil, 7; (13) Of unknown party allegiance, 17.

The new Duma was thus apparently more reactionary than the one which had preceded it. But public discontent and the inability of the Government to frame any effective policy of reform produced the unexpected result that a combination was brought about between the groups of the Left, the Octobrists, and even, in some cases, the Right Centre. In a general way the Duma assumed an attitude of opposition to the Government. This line of policy was especially conspicuous in a long series of interpellations and resolutions of want of confidence carried against arbitrary acts of the authorities. When a bill was passed by the Duma to establish rules as to the responsibility of civil servants, the Council of the Empire refused to sanction the most modest requirements in this respect, although even the Minister of Justice had expressed his agreement. On the other hand, the government did not scruple to prosecute a deputy (Kusnetsov) for a speech he had made in the Duma, and the administrative department of the Council of the Empire decided that members of the Legislature were liable to prosecution in such cases.

All measures of home policy, even the most urgent ones, were regarded from the point of view of political strife. The Education Committee of the Duma, in conjunction with the Zemstvos,

had worked out a plan for the provision and equipment of a sufficient number of elementary schools in order to secure universal instruction throughout the country. It was calculated that some 10,000,000 children had to be accommodated in the schools, in addition to about 5,000,000 who were already enrolled for a course of three years in the schools of the towns and the Zemstvos. In order to achieve the result by 1924, the Duma proposed to develop gradually a network of schools by means of appropriations successively increased by 10,000,000 roubles a year in the course of 10 to 12 years. This scheme could not be carried out in its entirety and in a systematic form, on account of obstruction from the Board of Education and from the Council of the Empire. These reactionary bodies were opposed to any policy which gave precedence to secular schools over Church schools, although it could not be contested that the former were much more advanced and perfect in teaching and organisation. The comprehensive law of consolidation was wrecked by the Council of the Empire; the "enlightened bureaucrat" Count Witte did not scruple to oppose the bill in alliance with the stalwarts of reaction, because, as he expressed it himself, it was an attempt to obtain paradise by means of child-murder, the murdered child being the Clerical school organisation. Thwarted in its comprehensive policy, the Duma nevertheless proceeded on its course by granting occasional increase of credits for elementary education.

These constant conflicts produced a perceptible sliding towards the Left in the ranks of the Duma legislators. One of the symptoms of this process consisted in the disruption of the Octobrist party. It broke up into three small groups—the Left, hardly distinguishable from the Cadets;<sup>1</sup> the Centre, which professed to devote its activity mainly to strengthening the Zemstvos; and the Right, which still clung to the idea of a possible alliance with a reformed Government. The dismemberment of the Duma into small groups gave influence to the Cadet nucleus, which, though it had few members in the Duma, was under strong discipline and was backed by a powerful press.

In one direction only the majority of the Duma was fairly in agreement with the Government, namely as regards foreign affairs and imperial interests. In spite of certain minor disagreements between the parties of the Left and the Centre and Right, the Duma as a whole was decidedly Nationalist. The Third Duma had bequeathed to the Fourth a definite line of policy concerning the Finland conflict: the Legislature backed the Government in its endeavours to subordinate the autonomy of the Finnish State to the superior claims of the Empire. The view that the union between the Grand Duchy and Russia was a *real* and not a *personal* one led to the assertion of the supreme jurisdiction of the Imperial Senate and of the St. Petersburg Court of Appeal over Finnish tribunals; to the passing of laws commuting the obligation of personal military service for money payments; and to the demand that Russians dwelling in Finland as citizens of the Grand Duchy should be recognised on equal terms with native Finns. Even the Cadets did not contest the general principle from which such demands were derived, although they disapproved of the raising of issues which embittered the intercourse between nationalities and led to unpleasant consequences in the shape of passive resistance. Finnish officials who refused to recognise the legality of the interference of Russian institutions in Finnish affairs, apart from the traditional channel of the governor-general and Senate as representing the authority of the Grand Duke, were imprisoned or deported.

The creation of the new province of Chelm (Kholm), separated from the provinces of Lublin and Sedlitz, envenomed another old national conflict—that between Russians and Poles. The new Government was formed out of districts in which the majority of the population was Little Russian, although this population had been included for centuries within the boundaries of the Polish State and had been recognised as a part of Congress Poland annexed to Russia by the Treaty of Vienna (1815). The Duma passed the law of separation without taking heed of the violent protests of Polish public opinion.

<sup>1</sup>Constitutional Democrats.

*The Conflict with the Central Empires.*—The Nationalistic orientation of the Third and Fourth Dumas was put to the test by the growing entanglements of foreign policy. Russia had definitely joined the combination of Western Powers against the predominance of Germany, and opinion in the country fully supported this momentous change of front. The annexation of Bosnia and Hercegovina by Austria under the protection of Germany "in shining armour" was strongly resented, not only by Stolypin and Isvolsky as the official exponents of Imperial policy, but by the nation at large. In 1911, during the Agadir affair, Russia was found on the side of Kaiser William's opponents. Matters became especially serious when the Macedonian hostilities, which had been smouldering for decades, burst out into flames in 1912. The coalition between Bulgarians, Serbians and Greeks against Turkey had been rendered possible and effective by the support on which they reckoned from Russia; and O. Hartwig, the Minister Resident at Belgrade, was one of the principal agents in bringing it about. M. Sazonov, the successor of M. Isvolsky at the Foreign Office, cautious, but devoted to the great tradition of Russia's protectorate over the Balkan Christians, was intent on using to the full the favourable situation created by the union between the three Balkan States, the sympathy of Western Liberals and the temporary indecision of the Central Powers. In this he was supported by the Tsar Nicholas, who, however, made it clear to his agents that Russia would not risk an actual war.

The crushing defeat inflicted on the Turks by the Balkan allies seemed to justify completely the combination engineered by Hartwig. But the harvesting of the fruits of victory proved a more difficult task than the actual fighting. The Central Powers had realised the menace of a permanent Balkan League to their ascendancy in the Near East. Austria vetoed any extension of Serbia towards the Adriatic. With the support of Germany she succeeded in depriving the Serbs and Montenegrins of the position they had won in Albania. At the London Conference Russia did not dare to back the latter's claims to the finish and the Western Powers were disinclined to proceed without Russia. The eviction of the Serbs from the west proved fatal to the peace of Europe. They tried to recoup themselves in the east by demanding districts of western Macedonia which had been previously conceded to the Bulgarians. M. Sazonov tried to stop the growing animosity between the Balkan allies by offering the mediation of Russia, and Nicholas II. attempted to exert his personal influence on the wily Ferdinand of Bulgaria as well as on the Serbians. These attempts at conciliation proved unavailing; the Bulgarians broke away first, but were soon checkmated by a coalition between Serbia, Greece and Rumania. The Peace of Bucharest, which gave the Dobrudja to Rumania, western Macedonia to Serbia and important districts of Thrace and Macedonia to Greece, shattered all hopes of an effective Balkan League, and laid Bulgaria open to the insidious intrigues of Austria and Germany. M. Sazonov manifested the chagrin of Russia; but his attitude only emphasised her diplomatic defeat.

All these events were watched by Russian public opinion with keen interest and warm sympathy for the cause of the Slavs. It was realised more and more clearly that the struggle did not concern merely the small States of the Balkans, but also their big neighbours. M. Sazonov found unexpected support from M. Milyukov, the leader of the Cadets. B. Maklakov and V. Bobrinsky came forward as the spokesmen of Slavonic solidarity. In this way, when the climax in the antagonism between Austria and Serbia was reached in the assassination of the Archduke Franz Ferdinand, the Russian public was prepared to back the Government against hostile acts of the Central Powers. The outrageous treatment of Serbia by Austria-Hungary was rightly interpreted as a provocation to the Entente, and especially to Russia. The only person of any weight who advised submission at any price was Count Witte. Everybody else, from the Emperor to the most humble citizen, understood that no choice was left but to fight for existence. (For Russian diplomatic action in the critical period before the outbreak of War see EUROPE, pt. ii. "*The Outbreak of War.*")

## THE WORLD WAR

*A United Russia.*—In the light of subsequent events the declarations made on the outbreak of the World War assume a particular significance. The representatives of alien nationalities expressed emphatically their resolve to stand by Russia in the struggle.

The Russian groups expressed their resolve to spare no effort in the struggle, and to support the Government to the utmost in the task of defending the country. Only from the little group of Social Democrats came threatening notes. Their spokesman dwelt on the solidarity of the proletariat all the world round, on the common guilt of all the governments in provoking the war, on the resolve of the proletariat to bring about a speedy peace, on the hope that the present terrible catastrophe would result in the abolition of all wars. These discordant notes were lost in the general display of enthusiasm.

The Tsar's Government was on the crest of a mighty popular wave; it might have steered a course towards victory and national regeneration if it had possessed the moral strength to throw away the tawdry equipment of despotism. Events soon proved that it was not only incapable of such an effort, but that its leadership was in itself a hindrance to success at home and in the War.

At the start, however, two steps in the right direction were taken by the Government: the abrogation of the State monopoly of the sale of spirits, and the promise of autonomy to the Poles. The Gordian knot of the temperance problem was cut by Imperial decree in spite of the difficulties raised by finance experts. The beneficial influence of the measure on the morals and health of the people and of the army cannot be doubted.

The appeal to the Poles was made in a proclamation of the Commander-in-chief, Grand Duke Nicholas. The grant of autonomy was held out as a reward for help against the common enemy, the Germans. It would have been better if the promise had come directly from the Tsar and if instead of vague words something tangible had been conceded at once. As a matter of fact the high bureaucracy began at once to put obstacles in the way of any reform. The damage done by these vacillations was incalculable. Instead of enlisting the wholehearted support of Polish patriots Imperial bureaucracy drove them into a position of distrust and hostility, which became especially keen in view of the tactless and offensive behaviour of Russian authorities in Galicia, and could not be placated by occasional concessions in details. This episode may serve as an example of the stupid policy followed by the Government in regard to all minor nationalities of the Empire: their enthusiastic rally was discouraged in every way, and old enmities were revived and increased at the most critical time. The case of the Jews was especially flagrant: numbers of them continued to perform their military duties faithfully and zealously, but many others took advantage of opportunities to spy and to betray their persecutors, and the round of executions and pogroms set in again with increasing force.

*The Effects of Misgovernment.*—In the field the old cancers of corruption and favouritism were again producing disappointment and disaster. The army did not lack excellent leaders—the chief-of-staff of the Southern command, Alexeiev, the corps commanders Ruzsky, Brusilov, Radko Dmitriev, were generals of the first rank. The officers and the common soldiers fought with the traditional tenacity and valour; no sacrifices were spared and brilliant victories were won. And yet on decisive occasions incredible things happened. Samsonov's army was destroyed, thanks to a slackness in co-operation between commanders. In Jan. 1915 an intelligence officer, Miasoyedov, actually sold the plans of the northern concentration to the Germans, and brought about a crushing defeat of Sivers' army. Worst of all it became clear towards the spring of 1915 that the army was insufficiently provided with munitions, aircraft, artillery and other appliances of war. The onslaught of Mackensen's and Hindenburg's Germans had to be met by soldiers many of whom had to man the trenches with sticks, in expectation that the death of comrades might give the chance of picking up rifles; batteries were for-

bidden to fire more than a couple of times an hour; the armies were surrounded by multitudes of "Kids"—marauders and deserters. Even in these terrible circumstances the Russians fought stubbornly, retreated step by step, and eventually, with the help of Alexeiev's strategy, succeeded in arresting the stream of the invasion on the lines of the Dvina and the Dniester. But the psychological effect of this desperate campaign was a lasting one. The common soldiers had learned that their blood was wasted without stint by a criminally careless and inefficient government. The way was opened to the insidious propaganda of defeatists and traitors. The revolution of 1917 was prepared on the battlefields of Gorlice and Krasnostav.

The progressive elements of Russian society attempted to save the situation by a great effort. The Zemstvo and Town Unions, which had been doing wonders in hospital work and equipment, offered their services for the fabrication of munitions:—

Towards the end of May 1915, at a congress of representatives of trade and industry, the discussion of technical questions was interrupted by an impassioned speech delivered by one of the leading Moscow millionaires, V. Riabushinsky, just back from the front and full of the impressions of the life and death struggle against the invaders. "The whole of Russia forms the rear of the army," he said. "We cannot busy ourselves with our everyday affairs at the present moment: every workshop, every factory must be used to break the enemy's force." It was not a question of forming this or that committee, but of sinking all differences and appealing to the assistance of every able man, without distinction of parties, as people had done in the West, in France and in England.

Technical committees were created with the participation of leaders of industry, Zemstvo workers, representatives of the working class: they displayed fervid energy and achieved good results. But the main condition demanded by Riabushinsky and Lvov—mutual confidence between the people and the Government—was conspicuously absent. Subordinate officials joined in the efforts of the unions, but the central Government continued to flounder in the morass of Court intrigues and supine reaction. The worthless Minister of War, Sukhomlinov, was indeed dismissed and put on his trial; the ancient bureaucrat Goremykin had to resign the premiership; but the appointment of his successor, Stürmer, provoked a general outburst of indignation. He was known for his reactionary opinions, and had shown his mettle in helping to coerce the progressive Zemstvo of Tver. His great merit was his subserviency and affected devotion to the Imperial family, especially to the Empress Alexandra Feodorovna. This hysterical lady meddled more and more with affairs of State, particularly after the assumption of the supreme command by the Emperor. And behind her stood various favourites, chief among whom was the astute peasant, Gregory Rasputin, whose exploits had made the Petrograd Court a place of scandal for the whole world. No wonder that the opening of the Duma in Feb. 1916 gave rise to manifestations very different from those which had occurred in that assembly in July 1914. The ally of Stolypin, Shidlovsky, speaking on behalf of the bloc of progressive parties, said: "The longing of the entire country towards a situation in which the country could entertain confidence in its Government, and feel in union with it, has been traduced as an incitement to seize power. . . . The forces of the nation, bereft of unity, aim and guidance, have been spent in vain, and the great national effort has weakened under the dissolving influence of discontent and indifference."

The discord between the Government and the Duma found expression on many occasions in connection with important questions of internal policy. A strike at the Putilov works, suppressed by military force, gave rise to a heated discussion in which the Duma, while condemning the strike as "a stab in the back," expressed the desire that the legal activity of trade unions should be given free scope and that courts of arbitration should be founded for the settlement of trade disputes. Perhaps the most significant pronouncement was made in the course of the debates on the budget of the Holy Synod. The Duma voted a resolution to the effect that it considered necessary a reform of the Church administration on the principle of the supremacy of Councils and of a wide application of local self-government. For this pur-

pose a national Council should be convoked without delay. The reform should extend to ecclesiastical courts, especially in the matter of divorce procedure, and to the ecclesiastical schools; the parish should be developed as much as possible; bishops should not be transferred from one See to another, if the consent of the Church had not been obtained. The State should cease to look upon the clergy as a political instrument, and all circulars and orders in this sense should be revoked.

The Government seemed to take delight in ignoring and thwarting all these resolutions. Stürmer was called to one ministerial post after the other. In Feb. he was appointed Home Secretary in succession to N. Khvostov, in July Foreign Secretary in succession to S. Sazonov, who was dismissed because he had urged the necessity of settling the Polish question in the sense of definite and real autonomy. Altogether ministerial portfolios were shuffled like cards at the bidding of the Empress.

It may be sufficient to notice the advent of M. Protopopov, a convert from the ranks of the Liberal bloc to the Ministry of the Interior (Sept. 1916). The dismay and indignation of the country found expression in a series of resolutions demanding the appointment of a Cabinet supported by the confidence of the people. Even conservative institutions like the Council of the Empire and the Association of the United Gentry joined in the chorus.

*The Popular Leaders.*—Before proceeding with the narrative of events which led up to the actual revolution, let us consider the various currents of thought and party organisation of the intellectuals who were preparing for the coming conflict.

It is not necessary to dwell at any length on the Octobrists and the Cadets. The former drew their main strength from the provincial gentry, the latter from the urban middle class and the liberal professions. The Octobrists pleaded for gradual development from local self-government, while the Cadets placed their hopes on the introduction of a constitutional democracy in which actual leadership would fall to the representatives of Western culture, but in spite of a recognition of the "four-tails" formula (*i.e.*, universal, equal, direct and secret suffrage), the Cadets had no hold on the mass of the people, and relied on the selection of the educated by the uneducated.

Socially and psychologically, the leading groups of the years of upheaval were bound to come from the midst of the extreme revolutionary intellectuals. Three leading currents may be distinguished in the history of revolutionary thought in Russia: militant idealism born of bitter resentment at the backward state of Russia in comparison with the West; the tendency to seek regeneration in a closer contact with the folklore of the common people; the economic materialism proclaimed by Marx. The views of the first group were most vividly expressed by writers like P. Lavrov and N. Mikhailovsky. They laid stress on the propaganda of progressive ideas in order to form the minds of irreconcilable fighters for emancipation in all fields of human activity. Lavrov had initiated a philosophical theory (anthropologism) somewhat akin to the humanism of the modern pragmatic school; Mikhailovsky had preached "subjective" ideals with great effect as a journalist and literary critic. His violent radicalism was directed not only against the "powers that be"; he repudiated "class struggle" as a "school of bestiality," from which men issued as "live corpses with faces distorted by rage." In contrast to these "Westerners" appeared a group of writers who clung to the conception of a special aptitude of the Russian people for social brotherhood and communal economics (Zlatovratsky, Korolenko, Kacharovsky): their antecedents must be sought in the romantic teaching of the Slavophiles as well as in emotional motives in sympathy with the toil and struggle of the peasantry.

In the case of active revolutionaries like Chernov, the radicalism of the Westerners was allied with the romanticism of the Populists, and in various combinations both tendencies helped to shape the views and the policy of the Social Revolutionary party. In the beginning of the 20th century one could distinguish some five groups representative of this party. Their principal organ (the *Messenger of Revolutionary Russia*) proclaimed the necessity of close alliance between revolutionary intellectuals

conspiring proletarians and the struggling peasantry. It laid chief stress on political rights, democratic organisation and the raising of the status and consciousness of the individual. Their methods of terrorism and insurrection were themselves the outcome of the heightened sense of personality and of the importance attached to energetic action and self-sacrifice.

The ways of the Social Democrats were different; they adopted Marx's teaching as a gospel and tried to develop and to apply it in every direction. Their chief exponent was for a time G. Plekhanov, a philosopher and economist who held strictly to the programme laid down by Marx, according to which Capitalism appears as a necessary stage in the development of production and gives way to Collectivism only when the majority of the workers have been turned into wage-earning proletarians. Plekhanov and his followers did not consider the Russian people ready for class war against the bourgeoisie, and insisted, on the contrary, on combined action with the social groups possessed of better education and greater political experience. The "Revisionist" movement, initiated in Germany by Brentano and Bernstein, found adepts in Russia (Struve, Prokopovich).

The burden of increasing taxation, the disastrous conduct of the Japanese War, the reactionary stupidity of the Government—all contributed to revive the revolutionary spirit in the ranks of the Social Democratic party. The history of this revival may be traced from the appearance in Dec. 1900 of the *Iskra* (The Spark) a newspaper conducted by Lenin and Martov, Lenin's pamphlets, *What is to be done?* (1902) and *Letter to a Comrade* (1903), express one of the leading ideas of his later activity. He pleads in them for centralised directions and decentralised responsibility, that is, for an oligarchy of leaders and strict discipline as regards the execution of their decisions by subordinate units. Democratic watchwords are set aside and efficiency of organisation is demanded at all costs. This led to the disruption of the party. At the London Congress of 1903 the fateful division between "Bolsheviks" and "Mensheviks" was inaugurated, as a consequence of disagreement concerning the problem of leadership and discipline. The Bolshevik ("Majority") group carried its proposals by a very narrow majority, and captured the Central Council of the party, from which they entirely excluded their opponents. The latter, who had a majority on the staff of the *Iskra*, proclaimed a boycott against Lenin and his adherents. The insignificance of the immediate cause of the split was only apparent: in truth the division arose from fundamental opposition between the democratic orientation of Plekhanov and the oligarchical spirit represented by Lenin.

Questions of principle arose in the course of the Japanese War and the first revolution. While Plekhanov and the Mensheviks were for co-operation with the Liberals in the fight for political freedom and for a gradual introduction of social reforms, Lenin set his hopes on the hatred of the peasantry for the landlords, and preached a ruthless *Jacquerie*. In his pamphlet, *The Agrarian Programmes of Social Democracy*, he contended that orthodox Marxians had failed to grasp the peculiarities of the Russian situation inasmuch as they were still talking about a coalition of the bourgeoisie of the towns, while in Russia the moving power was to be sought in the rising of the peasant bourgeoisie against the squires. He contrasted the abstract views of the town proletariat with the intense revolutionary temper of the peasants who were "ready to fly at the throat of the landlords and to strangle them."

It is hardly needful to point out the close connection between these literary disputes and the Zimmerwald agitation<sup>1</sup> of 1915-6.

<sup>1</sup> The Zimmerwald Manifesto of 1915 is full of momentous declarations. The following are some of them:—

"The war that has produced this chaos is the outcome of Imperialism, of the endeavours of capitalist classes of every nation to satisfy their greed for profit by the exploitation of human labour and the treasures of Nature."

"To raise welfare to a high level was the aim announced at the beginning of the war: misery and privation, unemployment and death, underfeeding and disease are the real outcome. For decades and decades to come the cost of the war will devour the strength of the peoples, imperil the achievements of social reform, and hamper every step on the path of progress. Intellectual and moral desola-

as well as with the eventual overthrow of the old régime in 1917. Let us note that the Congress of the Social Democratic party in 1917 sided definitely with Lenin and the Bolsheviks."

*The Revolution.*—The situation in the beginning of 1917 was extremely tense and abnormal. The Emperor had left the capital and taken up his residence at the army headquarters in order to see as little as possible of the ministries, the Duma or the Court, and to lead a "simple life" among the selected retainers of the Stavka; the Empress continued to look for hypnotising inspiration to monks and priests and interfered constantly in affairs of State in favour of reaction. Even the staunchest conservatives, like Trepov, found it impossible to remain in office under such conditions, and the field was left clear for half-insane subjects like Protopopov and bigoted courtiers like Prince N. Galitsin. The army at the front held on sullenly to its positions, but was war-weary and distrustful of its leaders.

### III. THE REVOLUTION AND AFTER

The history of Russia after March 1917 divides into three periods. The first, after the spontaneous collapse of the autocracy, is filled by the gradual crystallisation of leadership out of the interplay of many parties opposed to or favouring a social revolution in a country exhausted by war and for the most part inhabited by peasants hungry for land. In the second period the party gaining the leadership has temporarily satisfied the peasants and ended the war; is forced by a new civil war, which by the intervention of foreign Powers becomes a new national war, to identify itself with economic measures that would have alienated the peasantry if it were not that these still feared that defeat would mean a military restoration of the old landlords. In the third period, military pressure from without has ended, the peasants demand to be allowed to enjoy the fruits of the land which they are no longer in danger of losing, and the victorious party is trying to guide the economic recovery of the country along lines which, while satisfying the peasantry, shall confirm

tion, economic disaster, political reaction—such are the blessings of this horrible struggle of nations. . . .

"In this intolerable situation we have met together, we representatives of Socialist parties, of trade unions, or of minorities of them, we Germans, French, Italians, Russians, Poles, Letts, Rumanians, Bulgarians, Swedes, Norwegians, Dutch and Swiss, we who are standing on the basis, not of national solidarity, with the exploiting class, but of the international solidarity of the workers and the class struggle. . . ."

instead of liquidating the social revolution brought about during the preceding periods.

### THE FIRST PERIOD, MARCH 1917-MARCH 1918

*The Collapse of the Tsarist Régime.*—It would seem that a successful revolution is impossible so long as the existing régime is not rotten throughout. If a régime, however bad, has faith in itself and is coherent, the inertia of tradition will be enough to keep it in place. By the end of Feb. 1917 the imperial régime in Russia had lost all the circumstances of stability except a tradition that had at least been shaken by the attempted revolution of 1905, by the loss of the Japanese War and by a long series of military failures in the war with Germany. The imperial family was divided against itself. The Government was divided in its views of the imperial family. The Duma was divided in its opinion of the Government, and was very far from giving it anything like the whole-hearted support that even a good government needs in the gloomy moments of unsuccessful war. The authority of the Church was shaken by a series of scandals which touched not only the hierarchy but the reigning house. The unsuccessful War had affected everybody in the country, and, whereas most of the leaders of the Duma were dissatisfied because the War was not better conducted, the mass of the people were dissatisfied because it had not long ago come to an end. The army had lost faith in its commanders; and its commanders had lost faith in the Government that failed to supply them with adequate munitions.

*Petrograd in Revolution.*—It is difficult to decide who was responsible for giving that final jolt. There are a good many reasons for thinking that the initiative was taken not by the revolutionaries but by the old régime. For some time before March 1917 there had been talk of a revolt in Petrograd that could be suppressed and would make less likely the revolution that everybody expected after the War. The police had been trained in the use of machine-guns, and a number of these weapons had been more or less secretly placed in commanding situations in the city—the tops of houses, and it was believed, in certain bell-towers that would allow them to rake important streets. Further, the authorities had arrested just those representatives of the workmen who had been most active in preventing strikes and in furthering the manufacture of munitions of war. Miliukov, the Cadet leader, found it necessary to declare that someone, disguised as himself, had been urging the workmen to strike. As a matter of fact, the strike, urged by proclamations of the then extremely weak Bolshevik party, did not precede but accompanied and grew with the disorders that had had a very half-hearted beginning in the streets. Eyewitnesses agree as to the strangely artificial and aimless character of those disorders, at least in their early stages, and agree also as to the presence of police agents in the crowds that gathered in the Nevsky Prospekt, urging, for example, these most peaceable crowds to overthrow tramcars. A curiously tactless proclamation of March 9 by the military governor Khabalov threw the blame for a shortage of bread on hoarders, and thus led directly to looting. This proclamation, issued at the request of Protopopov, announced that there was plenty of bread in Petrograd, and was exasperating to people who found they could not buy it.

There was much that suggested conscious provocation on the part of the authorities. The revolutionaries were later inclined to imagine that the responsibility was theirs alone, and that the revolution was planned and led. They did not make these claims at the time, and the ease with which the Duma assumed at least the semblance of authority suggests that the revolting populace were quite unaware that they had had any leaders at all. Some of the leaders of the Duma have also been ready to claim responsibility, but their claim is even less defensible than that of the revolutionaries. The movements of crowds and individuals were, with the exception of the police, visibly without guidance or conscious objective, and the Duma leaders were themselves horrified when they realised that they were face to face, not with a change of government, which they sincerely desired, but with a collapse of the whole régime to which they belonged.

A few bakers' shops were smashed on March 8. A strike movement in protest against the shortage of bread was spreading from factory to factory. On Friday, March 9, though there were crowds in the streets, it seemed that the authorities wished rather to keep them together than to disperse them. The closing of the bridges seemed to promise that something was expected to happen, and it is possible that this prolonged expectancy had something to do with the ultimate nervous, sporadic, unorganised disaffection of the troops, which developed only gradually into active mutiny. It was remarkable on March 9 that the Cossacks were on good terms with the populace and anxious to keep so. It is said that the first blood shed in the revolution (Saturday, March 10) was that of a policeman who was attacked by a Cossack for striking an unarmed workman. Soldiers of the Petrograd garrison, when called out on Sunday, declared that they would not fire on their brothers. In order to destroy the moral effect of the obvious friendliness of the soldiery, and to prove to the crowd that the troops were still dependable, the police took 150 overcoats from one of the regiments and did some firing when thus disguised.

Another account has it that soldiers were dressed in police uniforms, but for this the motive would seem to be lacking. The incident brought the corps concerned and others into revolt. On Sunday, March 11, the 4th company of the Pavlovsky regiment broke barracks, and after some wild shooting fired at the mounted police. On Monday, March 12, almost every factory in the city was idle. The streets were crowded with people without definite objective, waiting to see what would happen. There was no programme. To an observer it was like watching migratory birds instinctively gathering and suddenly resolving on distant and hazardous flight. Here and there, in the streets, in different barracks, in different parts of the town, without communicating, men found themselves "on the side of the people." Soldiers meeting each other would call out, "For the people or against the people?" Whole regiments marching in perfect order, when they came face to face with the crowds they were called upon to disperse, would suddenly break up and give their rifles with kisses to anybody in the crowd who seemed to want them. Small boys were shooting at pigeons in the street with magazine rifles belonging to the Guards.

It was as if the will of the old régime were paralysed. Nothing was left of it but prisons, barracks, government buildings and police stations. Soldiers and populace marched from one barrack to another until all had thrown in their lot with the revolution. The prisons were taken one by one, and the prisoners released regardless as to whether they were criminals or political prisoners. Police stations were burned. Documents of the law courts flung from the windows made grateful bonfires beside the frozen canal. The capture of the arsenal enabled many to experiment with firearms that they had never handled before. Individual policemen, possibly ignorant of what had happened, kept up desultory fire from machine-guns in isolated posts until they were overwhelmed. Some of the members of the Government went into hiding. Others took refuge in the Admiralty, where they were besieged for a night, while to the accompaniment of joy-firing without they composed a proclamation ordering the people not to remain in the streets after eight in the evening.

*The Duma and the Soviet.*—The old régime had lost its will, but the revolution was as yet without a mind of its own and uncertain as to what to do with its victory. It had yet to become articulate. In the Taurida Palace, the seat of the Duma, were two groups ready to speak for it, one to persuade it that it had but taken the first step, the other to tell it that its work was done.<sup>1</sup> The

<sup>1</sup> On March 12 the Council of Elders of the Duma chose a temporary committee of members of the Duma: Rodzianko, Shulgín, V. Lvov, Dmitrukov, Shidlovsky, Karaulov, Kononov, Kerensky, Rzhnevsky, Miliukov, Engelhardt, Nekrasov and Tchkhaidze. On the same date was formed the temporary committee of the Soviet of Workers' Deputies: Gvozdev, Bogdanov, Kapelinsky, Grinevich, Tchkhaidze, Skobelev, Frankorussky and others. Tchkhaidze was in both groups. On the evening of this day was the first meeting of the Petrograd Soviet. The new Government formally took over office on March 14, with Prince Lvov as Prime Minister.

abortive revolution of 1905 was in the minds of both. The first of these groups was made up of labour members who, with co-opted friends (a likely man had but to put his head into the room to be co-opted by acclamation), formed a "temporary committee" of an as yet non-existent Soviet (Council of Workers' Deputies). These men remembered the part played by the similar Soviet in 1905, and were persuaded that it would be the chief instrument of revolution in 1917. They called upon the revolting regiments to send one representative from each company and the factories to send one for every 1,000 workmen to the first meeting of the Petrograd Soviet, which was to be held at once. The second was a much larger group of members of the Duma, who remembered with the utmost misgiving the Soviet of 1905, and were anxious at all costs to arrest the movement in Petrograd and to save what they could of the old régime. They had the advantage of being in touch with existing government apparatus, but the disadvantage of being compelled to insincerity in public utterance. In the face of the troops and the populace of Petrograd they had to welcome the revolution which in reality filled them with misgiving and disgust. The essential difference between the two groups in their attitude towards what was happening is best illustrated by their first instinctive actions. The Duma group looked in all directions for armed force that would act without "reasoning why." The Soviet group sought to make the revolution articulate. The Duma group asked the Tsar to abdicate in order to save the country from revolution. The Soviet group, exulting in revolution, appealed directly to it to defend itself against the Tsar or anyone else. What was an undesirable storm for the one was a fair wind for the other.

Troops with and without their officers came to the Taurida Palace, and at the same time declared their readiness to support the Duma and choose delegates to the Soviet. In the prevailing chaos, Duma and Soviet were alike crystallising points. Neither at the moment had any strength, but they seemed to have direction, and, in the general breakup of the organised will of the old régime, for a thing to seem to have direction was enough to make it a straw for drowning men. The Duma rapidly gathered the emblems of power, while the Soviet, by identifying itself with the masses of the factory workers and with the garrison by means of its invited delegates, was gathering the reality. This became perfectly clear in the course of the struggle round the throne. While the Duma was able to collect promises of support from the heads of the armies, the Soviet was able to prevent Rodzianko (President of the Duma) from going to discuss matters with the Tsar. Rodzianko had done his best to persuade the Tsar to take some action that might at least temporarily have appeased the discontent of which everyone was conscious before the revolution broke out.

*Abdication of the Tsar.*—It was now too late to hope to do more than satisfy the revolution with a change of person. The Tsar was to abdicate in favour of his infant son, nominating the Grand Duke Michael as regent. Guchkov and Shulgin (both confirmed monarchists) were sent on March 14 to the Tsar to obtain his abdication. The Tsar abdicated (March 15) both for himself and for his son in favour of the Grand Duke Michael, but by the time Guchkov and Shulgin returned to Petrograd the revolution had so far crystallised round the Soviet that it was clear that this arrangement for the preservation of the dynasty would not be accepted without a struggle. Miliukov, the leader of the party of Constitutional Democrats (Cadets), who consistently underestimated the forces that had been unchained, and was perhaps inclined to estimate his influence on the people by the devotion given to him in his own party, by announcing that the Duma Committee had decided to leave the dynasty on the throne, had lifted the veil that had covered the real feelings of the Duma Committee, and so had enormously strengthened the Soviet.

Already the fear of that organisation had induced the Duma Committee in forming a Government (March 14), to include representatives from the Left. Kerensky, a lawyer and member of the so-called group of Labour, had dramatically obtained permission from that other room in the Taurida Palace before

taking a part in the Government, where he carried particular weight (together with opprobrium) because of his connection with this outside force of which the other members of the Duma committee were instinctively and rightly afraid.

His attitude to the revolution was not that of his new colleagues. He could speak with an enthusiasm which they could not counterfeit. He was not hampered, at first at any rate, by a profound dislike of the events that brought him to power. After the return of Shulgin and Guchkov (who themselves realised that the situation had changed considerably during their short absence from the city) the Duma committee laid the Tsar's abdication and the throne before Grand Duke Michael on March 16, and he, perhaps feeling that he was being offered what at that moment no one had the power to take, refused the throne, and was solemnly congratulated by Kerensky on his refusal. Pushed by events that they were quite unable to control, the Duma committee assumed with as good a grace as possible the nominal government of the Empire, the Soviet contenting itself with insisting that the proclamation of the new government should contain a clause promising that the nation should be allowed to decide the future of the country in a constituent assembly.

*The Provisional Government.*—In a few days the whole of Russia had learnt that the autocracy was no more, that a new Government under Prince Lvov, with Guchkov as Minister for War, Miliukov as Minister for Foreign Affairs and Kerensky as Minister of Justice was in place not in power, and that there was once again a Soviet in Petrograd inviting the formation of similar Soviets throughout the country.

The Provisional Government, described by Miliukov as having been "elected by the revolution," rapidly obtained a fair measure of apparent stability. It was formally recognised (March 22) by the Allied Governments. The whole civil service transferred to it their former loyalty to the autocracy. Its weakness was that it was content with these things, was deceived by the prestige which it enjoyed among a limited class and by its possession of the old administrative machine, and neither had nor sought to obtain that right to speak and act for the revolutionary masses which was given to the Soviets by their direct connection with factories and troops. The only Government decrees that had any certainty of fulfilment were those that the Soviets would have been ready to countersign. As the Soviet was for a long time unwilling to take supreme control, the result was not "dual power," but actual though not formal responsibility of the Government to a Soviet of the very existence of which most of the ministers heartily disapproved.

In time of peace the natural slackening of political tension in the masses might have brought about a decadence of the Soviets and an eventual concentration of real authority in the hands of the Government. But Russia was at war, and the continuance of the War made any slackening of political tension impossible. If the War lasted long enough it was clear that the Soviets would have to take authority openly into their hands, or submit to being crushed by military forces which would then replace them as keepers of the Government's conscience. It was consequently natural that the first bone of contention between Soviet and Temporary Government should be the control of the army. Rodzianko, and after him the Temporary Government, sought to control the army through its leaders, and hurried to obtain expressions of their allegiance. The Soviet could not hope for support from the officers, and therefore sought to make them powerless while assuring itself of the support of the men.

Remembering 1905, they knew that their existence depended on the inability of their enemies to bring an organised force against them. Not pro-Germanism, but the events of 1905, dictated the famous Prikaz (Order) No. 1, (issued on March 18) which hurried towards its end that process of disintegration in the army which had been begun by inefficient government, officers who had made themselves hated, over-mobilisation and a long succession of military failures.<sup>1</sup>

<sup>1</sup> Prikaz No. 1 was composed by a commission of the Petrograd Soviet headed by N. D. Sokolov. In the name of the "Soviet of Workers' and Soldiers' Deputies," it ordered that committees of

It was proved once again that in the minds of its participants a civil war, and especially a struggle between classes, outweighs any national struggle whatsoever. In the months that followed, the parties of the Right were as ready to weaken the front by bringing disciplined troops to suppress revolution in the rear as were the parties of the Left to weaken the front by destroying the discipline of the troops. Both sides were conscious of enemies nearer and more dangerous than the Germans.

*Party Demarcations*—Roughly speaking, there were but two sides to the struggle. There were, however, many parties engaged. Scattered remnants of the parties on the Right in the old Duma had clung to the revolution in time to save themselves from being buried in the collapse of the old régime. On this side the only well-organised party was that of the Cadets (Constitutional Democrats), who renamed themselves the party of Popular Freedom, and, after failing to preserve the dynasty, were now trying to arrest the revolution before it should overwhelm the landlords and the factory owners. The Cadets were in open hostility to the Soviets. Then came parties with a foot in both camps, supporting the Temporary Government but unwilling to see the Soviets suppressed, since they were conscious that the parties on their right would not stand on ceremony with them if the Soviets were only out of the way. Of these the most important parties were the Social Revolutionaries and the Mensheviks as they were called.

The Social Revolutionaries believed that social revolution was impossible, but desired an agrarian revolution to the advantage of the peasants who were their chief support. The Mensheviks and the Bolsheviks were the two sections of the old Social Democratic party, which was based on the factory workers of the towns. They were temperamentally divided, the former inclining always towards coalition with the bourgeois parties and doubting the possibility of social revolution in a country in which capitalism was as little advanced as it was in Russia, the latter opposed to any coalition with the bourgeois parties now that their common enemy (the autocracy) was no more, and believing that the World War had so shaken the economic system of Europe that a social revolution was possible everywhere and most possible in Russia. Skirmishing between and around these parties were many small sections of Social Democrats, Maximalist-Internationalists, groups identified with particular newspapers and loosely organised parties of Anarchists.

Social Revolutionaries and Mensheviks had taken a line during the War which, in spite of the arrests immediately before the revolution, had made them much less subject to persecution than the Bolsheviks, who, in Feb. 1917 were in a state of almost complete disorganisation. Nearly all the Bolshevik leaders were in prison, in exile or abroad, harried both in Allied countries and in those of the Central Empires because of their doctrine that the War was exclusively to the advantage of the bourgeois classes, that it was a capitalist quarrel and that the working classes should bring it to an end by refusing to fight each other and by turning in each country against their rulers. No fighting country could tolerate such propaganda, and a series of deportations had left the Bolshevik leaders for the most part in Switzerland, Sweden and America. It was not surprising that Swiss Socialists were easily able to get leave for Lenin to cross Germany with this theoretical baggage. Trotsky (with almost identical views, though not then a Bolshevik) was arrested on Allied soil, but allowed to proceed on the intercession of Miliukov, an intercession which proved sufficiently that real power in Petrograd was in the hands of the Soviet.

soldiers were to be formed in all military and naval units, and to send one representative each to the Taurida Palace next morning. In their political actions units were to be subject to their committees and to the Soviet. Orders of the military commission of the Duma were to be obeyed only when they did not contradict those of the Soviet. Arms were to be under the control of the committees and on no account to be given up if demanded by the officers. Strict discipline was to be preserved when on duty. Salutes, etc., when off duty were abolished. Special titles used in addressing officers, "Your excellency" and references to the officer's noble birth, were abolished. Officers were forbidden to use the second person singular in addressing soldiers.

*The Return of Lenin.*—Lenin arrived in Russia on April 16 after crossing Germany in a sealed railway car, and then passing through Sweden and Finland. He made his first speech at the railway station, where he was met with mixed misgiving and enthusiasm by his old revolutionary associates. He found only a handful of his party in the Soviet. From the moment of his arrival the Bolsheviks had a definite policy. They set themselves to bring into the open the profound mistrust of the masses that actuated the Temporary Government. They urged that the Soviets should take power (in spite of the fact that they were themselves in a minority) believing that the other parties in the Soviets would lose the confidence of the masses by showing that they had no confidence in themselves. They urged the immediate ending of the War. They were at first comparatively few, but they had none of their opponents' psychological handicap of doubt. Revolution had always been to them of greater importance than any war waged by non-revolutionary Governments.

It was not surprising that they made converts rapidly. The peasants, soldiers and workers had never considered the matter before. Russia was not a homogeneous country. Even invasion left huge areas of it quite indifferent except to mobilisations and economic troubles, for which they did not blame the invaders. Peasants and workers alike were heartily sick of the War, and were besides inflamed by the miracle of the old régime's collapse. Everything seemed possible. The world had been turned upside down, and they had other things to think of than a war in which they had never had any personal interest. Throughout the country the peasants began to settle the land question in their own way by taking the land of the squires. The peasant soldiers wanted to get home anyhow, and began to be afraid of missing their fair share of the land if they remained too long away. None of them wanted to die just as a new world was opening before them. They wanted peace, at once, so that they could settle things to their own advantage in that new world. The masses were, as Lenin rightly perceived, far more "Left" than their representatives in the Soviets.

*Continuance of War.*—The Temporary Govt. were quite unable to disguise their disagreement with them. The Soviet, however, acted as a buffer between Government and masses, and, while not going so far as to demand an immediate end of the War, sought to remove all obstacles to the conclusion of peace by renouncing all claims to territorial or monetary gains. If Russia was not to make peace without getting Constantinople, the end of the War was not in sight. If she were ready to make a peace based on ethnographical frontiers, she at least would not be to blame for the continuance of war. On April 9 the Temporary Govt. issued a declaration agreeing verbally to these principles, but on May 3 was published the note with which Miliukov had accompanied that declaration in sending it to Russian representatives abroad for transmission to the Governments to which they were accredited. This accompanying note (said to have been unanimously approved by the Temporary Govt.) informed the Allies that in spite of their disturbing views Russia's position with regard to the War was unchanged. The Soviet was indignant. There were angry demonstrations, and Miliukov's resignation (May 15) came too late to undo the work his note had done in helping the Bolsheviks by creating distrust of the Government.

The Government tried to borrow authority from the Soviet by borrowing names from it. In the reconstructed Government Prince Lvov now (May 18) had Kerensky as Minister for War, in place of Guchkov, who had resigned in despair (May 12); Chernov (Social Revolutionary) as Minister of Agriculture; and Skobelev (Menshevik) as Minister of Labour. Tereshtchenko, a clever young sugar magnate, replaced Miliukov at the Foreign Office. The Temporary Govt. thus included landowners and men who had spent their lives in preaching that the land belonged to the peasants, manufacturers and men who believed in the socialisation of industry. It was damaged alike by the support and by the criticism of the Cadets, and by the support and by the criticism of the Socialist parties. A political Joseph's coat of many colours draped a weakness that was betrayed at the

slightest tension in one direction or the other. Meanwhile, without the responsibility, the Soviets were consolidating their position, though becoming increasingly conscious that the masses, interested mainly in land and peace, were steadily transferring their allegiance from the more moderate parties to the Bolsheviks.

Meanwhile the War continued, though in the Russian trenches the din of continual dispute had replaced the silent discontent of the year before. Officers' messes, soldiers' committees and the soldiers were on the front what Government, Soviet and masses were in the capital. Without the sanction of the committees the orders of the officers were not obeyed. The committees were markedly more inclined to support the officers than were the men whom the committees represented. Just as in the rear they could point to the support of the Government by the Mensheviks and Social Revolutionaries, so at the front the Bolsheviks could undermine the soldiers' committees by pointing out how they supported the officers. The officers, however, lumped in common detestation the committees with the Bolsheviks who were undermining them, just as in the rear the parties on the Right helped the Bolsheviks by attacking the Soviets, in which as yet the Bolsheviks were in a minority.

Things were moving in a definite direction. Their speed was increased by the decision that the Russian Army was once more to take the initiative on the front. After an extraordinary oratorical campaign by Kerensky in June the Russians made a spectacular advance<sup>1</sup> in the southwest, naturally sacrificing in doing so a large proportion of that leaven of officers and men who were still prepared to fight. The political meaning of the advance was illustrated in Petrograd by the demonstrations by well-dressed people which accompanied the first news of the victories. But the victories were followed by a series of defeats and a disorderly rout, during which hundreds (some say thousands) of fleeing Russians were shot down by other Russian troops.

The morale of the army was finally broken. The struggle in Galicia was reflected in an intensification of political feeling in the capital, where, though one side shouted "War" and the other shouted "Peace," both were less interested in war and peace than in the struggle for power in which all parties were engaged. In these critical days the Cadets announced (July 16) their withdrawal from the Temporary Govt. (disapproving of its policy in the Ukraine), thus weakening it by an attack from the Right at the very moment when it had to fear an attack from the Left. It was in these days that a large part of the Petrograd garrison, together with many of the factory workers, paralysed the town on July 16 by demonstrations the object of which was to persuade the Soviet leaders to assume the government of the country.

*The Executive Committee.*—The most important feature of the Soviets in the early period of the revolution was that they were in a continuous state of general election. Agitation was going on all the time by all parties, and successful agitation ended in the recall of the delegate of one political denomination and his replacement by a delegate of another. Opinions changed from day to day, and many people, not merely those without political experience, slipped rapidly through a whole gamut of political allegiances. The result of this was that the Soviets reflected very well the changing political complexion of their constituencies. In the middle of June was held in Petrograd the first All-Russian Congress of Soviets, to which delegates came from Soviets all over the country. It was mainly Menshevik and Social Revolutionary. While in favour of all possible steps towards a general peace, it supported Kerensky on the question of national defence. This Congress elected an Executive Committee, which was to act for the Congress after its dispersal until the next All-Russian Congress should meet. This Executive Committee was thus the chief organ of the Soviets, and not subject to any change of political complexion until the meeting of the next Congress, whereas the masses for whom it was to speak were changing with extraordinary rapidity. Kerensky's advance on the front, which seemed to the masses to mean the abandonment of any hope of peace, brought the Executive Committee within a few

days face to face with the fact that it would presently be left high and dry by the movement it sought to control and represent.

On July 16 and 17 regiments of the garrison, a large body of the Kronstadt sailors and bodies of the factory workers made an extraordinary demonstration. For a number of hours the town was entirely in their hands. The Government was powerless. Yet nothing happened. The demonstrators marched to the headquarters of the Executive Committee and called upon them to take power. The Executive Committee replied that they did not wish to do so. The demonstrators, puzzled and disheartened, melted slowly away. Finally the authorities gathered courage and hastened their departure. The effect of these events was to confirm the Executive Committee in its support, such as it was, of the Government, but to frighten the Government into measures which lost them that support until a new move from the left drove Committee and Government together again. From this moment, Kerensky (on whom more and more fell the whole responsibility of governing), together with the Executive Committee, was tossed now to the Left now to the Right by the forces on either side, until by a process of attrition he was left without support and Rights and Lefts faced each other openly in civil war.

The first result of the fright of July 17 was a desperate effort to make an end of the Bolshevik agitation. Comparatively uninfected troops were brought in from the front. The offices of the Bolshevik newspaper *Pravda* were sacked on July 18. The headquarters of the Bolsheviks were seized. Trotsky and many Bolsheviks were arrested; Lenin and Zinoviev only escaped arrest by hiding in disguise. Kerensky, appointed Prime Minister on July 21, formed a third Temporary Government. This Government too felt the sand slipping from under it, and endeavoured to secure for itself at least a semblance of popular support by summoning a State Conference in Moscow in the hope that the atmosphere of Moscow would be less electrical than that of Petrograd. The conference met towards the end of Aug. and was a spectacular affair, but illustrated chiefly the increasing loneliness of Kerensky. On the one hand general after general expressed his views on the disorganisation of the army and the need for a strong Government, and on the other the illusion of popular support was destroyed by a strike of the Moscow workmen.

On Sept. 3 Riga was abandoned to the Germans. Five days later General Kornilov advanced on Petrograd with the object of establishing a military dictatorship. It is said that this adventure began as the result of a misunderstanding (*see* KORNILOV). However that may be, it was warmly approved by some of the representatives of the Allies in the capital, and led to a strengthening in the first place of the Executive Committee and the Soviets (to whom Kerensky had to turn for support against Kornilov), and in the second place of the Bolsheviks who had their thesis on the imminent danger of counter-revolution thus illustrated on a big scale. The Cadet ministers resigned, and did not attend their ministries. The Executive Committee succeeded in stopping the Kornilov troops by talking to them, and instead of hanging agitators from lamp posts, as had been expected, their representatives came into the town in a motor-lorry to explain that they had been misled.

*The Directorate.*—The Temporary Govt. resolved itself into a Directorate of five with Kerensky at the head of it, and, without waiting for the Constituent Assembly, declared Russia a republic (Sept. 15). The growth of Bolshevik influence throughout Russia was shown by the passing of Bolshevik resolutions in both the Petrograd and Moscow Soviets (Sept. 13 and 15). These were signs more threatening both to Kerensky and to the Executive Committee elected in June than the abortive demonstrations of July. It was not surprising that when Kerensky made yet another attempt to secure for his government foundations in popular support, he found the Executive Committee of the All-Russian Congress of Soviets willing to help him by joining in a conference the obvious purpose of which was to lessen the significance of the Soviets themselves.

This was the Democratic Conference of Sept. 27, at which were present not only the Executive Committee, but representa-

<sup>1</sup> Battles of Brzezany (July 1-6) and Zborow (July 19-26).

tives of the trades unions, co-operatives, town and rural councils, etc. With great difficulty a resolution in favour of a coalition (*i.e.*, not exclusively Socialist) government was passed. It was accompanied by a resolution refusing coalition with the Cadets. The two resolutions cancelled each other. Out of this conference, with the addition of other elements, grew the Council of the Republic (nicknamed the Predparliament—Preliminary Parliament)—which was to be the supreme governing organ until the meeting of the Constituent Assembly. It too was without roots and without influence. Yet another government was formed under Kerensky's premiership, including several Cadets. The Predparliament met on Oct. 20. It was never dissolved but simply faded away. Things were moving too fast for anybody to pay much attention to a wholly artificial body. Both the Petrograd and Moscow Soviets had elected their local Executive Committees with Bolshevik majorities. It was clear to everybody that when the second All-Russia Congress of Soviets met it would be likely to elect an Executive Committee that would no longer oppose the Bolshevik desire that the Soviets should take both formal and actual authority into their hands.

*The November Revolution.*—Lenin from his hiding place had been pressing for some time for an immediate seizure of power. At last he was able to get the Bolshevik Central Committee to agree with him. On Oct. 29 this committee, together with delegations from the factory committees, the trade unions, the railway workers, etc., agreed upon immediate action. The Petrograd Soviet had formed a Military Revolutionary Committee, which, since its first object had been to prevent troops being moved from Petrograd to the front to be replaced by others on which the Government could rely, had no difficulty in assuring itself of the allegiance of the garrison. The Government showed their lack of confidence by finding it necessary to issue orders to the troops to take instructions only from the district staff. As the second All-Russia Congress of Soviets was to meet on Nov. 8 everyone in the town knew when to expect the revolt. Kerensky in the Predparliament demanded extraordinary authority for its suppression. The Predparliament desperately resolved to ask the Allies to open peace negotiations and to hand over the land to the peasants without delay. It was too late. The trial of strength came at once. The Government ordered the suppression of two Bolshevik newspapers. The Military Revolutionary Committee replied by ordering the Government troops to protect the Bolshevik newspapers. The papers came out as usual.

The Revolutionary Committee made its final arrangements openly over the telephone, and on Nov. 7 detachments of troops and workmen took possession of the Government buildings. On that day Lenin, who had left Finland some days before and was living in hiding, came to the Smolny Institute. The second Congress of Soviets met in Petrograd (Nov. 7) with a big Bolshevik majority; the old Executive Committee was replaced by a new one largely Bolshevik; most of the representatives of the other parties walked out; the Government was declared overthrown, and a Council of People's Commissars was elected by acclamation (Nov. 8). Lenin presided over the Council, which was at first exclusively Bolshevik, but presently included some Left Social Revolutionaries, representing that wing of the Social Revolutionary party which approved of the assumption of authority by the Soviets. Some members of the Kerensky Govt. were besieged in the Winter Palace and captured there. Kerensky himself escaped almost alone to meet the troops he had ordered up for the suppression of the revolt. He joined General Krasnov at Gatchina on Nov. 8 or 9.

For a few days it seemed possible that General Krasnov's force of 1,500 Cossacks would succeed in conquering the utterly undisciplined forces of the revolution, which consisted of soldiers who did not want to fight and workmen who wanted to fight but did not know how. With the help of sailors from Kronstadt and Helsingfors the Cossacks were, however, defeated. Krasnov was taken prisoner on Nov. 14, and released on parole; an act of generosity which the Bolshevik leaders subsequently had cause to regret. There was little serious fighting. It was a struggle

between two weak forces, of which one, Krasnov's, had discipline but no convictions and the other convictions but no discipline. The latter were able to make a slightly better show in numbers. Victory in a skirmish at Pulkovo decided the event. Kerensky had fled in disguise before the defeat of Krasnov. The Cadet and the Menshevik parties supported several abortive attempts at a rising in the town of which the most important was a revolt of the Cadets of the Mikhail or other military schools. In Moscow there was nearly a week of street fighting before the Soviets were in undisputed possession.

Elsewhere the new turn in events was rapidly reflected throughout the country, except in the Cossack districts, where General Kaledin had been able to organise resistance, and in the Ukraine, where the expression of separatist tendencies had produced a rather more strongly supported Government than there had been in Petrograd. It was not until Feb. that the whole of the Ukraine was in the hands of the Soviets. The events in Petrograd spread like a spark in a fuze along the Siberian railway, though officers of the old army seized power in the Far East. In various parts there were encounters between forces supporting the Soviets and small bodies migrating from the front towards the Cossack country, which became the natural focus of the counter-revolutionary officers. But these forces were as much opposed to Kerensky as they were to the Soviets, and within a few days there was no town in Russia that still recognised the Temporary Govt., though, so huge is the area of Russia, so limited the means of communication, that years after it was still possible to find in remote districts people who had hardly realised that anything in particular had happened since 1914.

*The Bolshevik Government.*—The Council of People's Commissars set up by the Congress of Soviets was now the only Government in Russia, but did not, like the Temporary Govt. at the beginning of the revolution, find itself in possession of an almost undamaged administrative machine. Its opponents, regardless of the fact that Russia was still at war, seemed determined to justify the Bolshevik claim that the new Government and the old represented hostile classes—whose hostility was more pronounced than any that could exist between warring countries. The whole of the civil service went on strike with the exception of about a dozen young women. In many cases the civil servants deprived the new Government not only of their services but also of the petty cash of the ministries to which they belonged. A new civil service had to be built up in a hurry out of nothing, and in the beginning the whole of it was housed in the Smolny Institute, formerly an educational establishment for the daughters of the aristocracy and latterly the headquarters of the Petrograd Soviet. In one room was the President, in another the Home Office, in a third Trotsky was conducting Foreign Affairs, in a fourth a few youthful doctrinaires were covering reams of paper with sketches of what they thought should be State finance, in a fifth was the War Office and the General Staff, wrestling wildly with the defence of the capital and very resentful of the President, who insisted on bringing a kitchen table into this room and taking an active part in the military deliberations. In a big room in the building meetings were in continual progress, and one after another the members of the Government would gallop down the long corridors to address excited crowds and then hurry back to go on with their work. Many of them slept in these improvised offices, and, having at first no time for proper meals, lived on enthusiasm, sandwiches and weak tea.

With none of the emblems of authority, but with the confidence given by victory in Petrograd and by the Bolshevik majority in the Congress, which promised victory in the provinces, Lenin began at once to speak in the tone of an established Government. "We are strong," he said, "when we express that of which the masses are conscious." He was not handicapped as Kerensky had been by pressure from both sides. He did not claim to be representing all classes, but saw his Government as an instrument of revolution, with the immediate task before it of strengthening itself by trying to carry out the desires of those classes which had put it in power and by destroying the means

of resistance of those classes which would otherwise destroy it. Hostility between classes was to him a strength, not a weakness, and if the bourgeoisie had not helped him by so clearly showing their hostility he would have had to provoke them into doing so.

The Soviet Govt. proceeded at once (Nov. 8) to declare that all land belonged to the people, to be used without payment; this decree legalised the agrarian expropriation begun early in the summer, which was the chief thing that the peasants thought to gain by the revolution. The Soviet Govt. decreed an eight-hour working-day (Nov. 11); it abolished titles other than that of "citizen" (Nov. 23); the workers were to control the factories (Nov. 29), placing them under the general guidance of a Council of Public Economy (Dec. 18); it made labour a condition of political rights; it decreed a general arming of the "working" and a disarming of the "possessing" classes; it annulled all secret treaties; it disclaimed responsibility for loans made to previous governments; it nationalised the banks (Dec. 30); declared the independence of Finland (Jan. 4 1918); it introduced the Western European calendar (Feb. 14); it separated Church from State and School from Church (Feb. 5 1918); and while setting up a federation of Soviet Republics in the place of the old Russian Empire, left the question of entry into that federation to the Soviets of the nations and districts concerned.

This was a beginning sufficient to secure the hostility of all foreign Governments and of all but the working classes in Russia, and the instinctive support of most Socialists everywhere. The Bolsheviks, now in almost absolute control of a Government, had spent 20 years in ceaseless debate as to what a revolutionary government should do, and they set about putting their decisions into practice as fast as they could write the necessary decrees—193 decrees were issued between Nov. 8 and Dec. 31 1917. When, as in the case of the land, they issued a decree that did not represent their own views, they issued one that satisfied the peasant and ensured unwillingness on his part to help in any attempt to replace them by another Government that might issue a decree of a less desirable character.

*Attitude Towards the War.*—The downfall of the Kerensky Govt. and the accession of a Government supported exclusively by the working classes naturally brought about a radical change in the attitude of the Bolsheviks towards the War. They had from the beginning seen the War as a struggle between capitalist groups, and had declared that revolutionaries in each of the countries engaged should desire the defeat of that country on the ground that the defeat of one capitalist group by another would weaken it not only among its peers but also in the face of revolution from below. They had assumed that German Socialists would desire the defeat of the Kaiser, that French Socialists would desire the defeat of the French Republic. For themselves they did indeed desire the defeat of the Tsar. The year 1870 had given France the experience of the Commune which for 70 days had ruled Paris. The defeats of the Japanese War had resulted in the events of 1905 and the first serious attack on the autocracy. During the War defeatism in Russia had spread far beyond the Bolsheviks, when the most loyal of Liberal monarchists could not help observing that defeats on the front meant that the voice of the Duma counted a little in the Palace, whereas success meant an immediate hardening of the autocracy. The downfall of the autocracy was for the Bolsheviks only a preliminary to the social revolution. Their defeatism continued until the downfall of the Temporary Government. That downfall meant for them that power had shifted from the autocracy to the bourgeoisie and now to the working class. Further defeatism would now be possible only to the enemies of the working class, who would reason that defeat would now be to their advantage.

From the moment that the Bolsheviks took power the defeat of Russia ceased to be desirable by them, whereas the German Empire became the most dangerous enemy of the revolution, because it was the nearest and most powerful non-revolutionary State. On the other hand, a victory of Russia in concert with the Allies was equally undesirable, because it would discredit the revolution in the eyes of the German working class. The

only possible course for the revolution was to retire from the struggle if it could, and to use the steps it could take towards peace as a means of rousing the working class of other countries to impatience of the continuance of the War. To understand what followed it is essential to remember that there was for the Bolsheviks no difference in kind or quality between the Governments of the Allies and those of the Central Empires. All were equally rapacious. Some of the Bolsheviks even thought it possible that in the presence of social revolution in Russia the two camps would hurriedly compose their differences and crush the revolution before it had time to entrench itself.

At the moment of taking power, the revolution was powerful against its enemies inside Russia, for these were divided and impotent. But the shaking to pieces of first the autocracy and then the classes that succeeded the autocracy had been accompanied by the complete ruin of the army. After the first month of 1917 desertion had been a rapidly growing tide. The vague idea of land distribution crystallised an already existing weariness of war into a blind determination to leave the front. Even before the Nov. revolution Kerensky's War Minister had told him that the only thing to be done with the old army was to disband it and start afresh to build a new one. The Nov. revolution found the army all but disbanded, in spite of Kerensky's efforts to keep it together. The trains were crowded with soldiers, many of whom took their weapons with them. Most of the men were straggling back to their villages if they knew how to get there. Others simply travelled, boarding any train if it had room on its buffers or on the roof of its coaches, and changing from one train to another without care for its ultimate destination. Stations were camps of migrating soldiers. Officers were going southwest to the Cossack country to raise forces against the revolution. The Germans could easily have walked into Petrograd, and been welcomed as they were welcomed in Kiev by everybody who preferred being ruled by a foreigner to being ruined by a revolutionary.

*Peace with Germany.*—The Bolsheviks accordingly proceeded at once to keep their promise to take immediate steps to bring the War to an end. Trotsky as Commissar for Foreign Affairs sent out (Nov. 9) alike to the Allies and to Germany an invitation over the wireless to conclude an immediate armistice. Germany agreed. The Allies did not reply except by remonstrances, presented through their military representatives to General Dukhonin, against a separate peace. An appeal was sent (Nov. 28) by wireless to the peoples of the Allied countries urging them to compel their Governments to bring the War to an end. The Russian commander-in-chief, Dukhonin, while himself agreeing that an immediate peace was necessary for Russia, refused for technical reasons to take steps for concluding an armistice along the front. He was dismissed, arrested and lynched while under arrest. Krylenko, a rather elderly sub-lieutenant, was made commander in chief. An informal armistice began at once, a formal one being concluded a few days later (Dec. 5) for the whole front, from the Baltic to the Black Sea.

The Germans were ready to accept in principle the Russian formula of a peace "without annexations or contributions on the basis of the self-determination of peoples," but soon showed that they, like the Allies, had altogether underestimated the Bolsheviks' sincerity. They believed that the Bolsheviks would be ready to hide under that formula the sort of peace that was desirable by the German general staff. In this they were wrong.<sup>1</sup> The Bolsheviks promptly announced (Jan. 27) both to Russia and to the world that the peace the Germans were offering was the sort of peace offered by a wolf to a sheep, too big to be eaten all at once. They hoped that the German working classes would be roused to action on finding that the greed of their rulers prevented the signature of peace. The bourgeois Government of the Ukraine signed a separate peace (Feb. 9) after it had been driven over the Ukrainian frontier, and invited the Germans to enter the Ukraine to replace it in power (*see* BREST-LITOVSK). The Bolsheviks declared (Feb. 10) that they would no longer fight but

<sup>1</sup> An account of the negotiations in Brest-Litovsk which opened on Dec. 21 will be found under that heading.

would not sign the peace. The Germans advanced and could, no doubt, have come to Petrograd and put a Russian bourgeois Government in power to make peace with them.

After a fierce struggle in the Central Committee of the Communist party, Lenin persuaded the Bolsheviks that the best thing they could do was to sign peace at once if the Germans would let them. This was done. The peace signed (March 3) was worse than that originally offered, and, thanks to the action of the Ukrainian Rada, worse even than it seemed on paper. The Germans occupied the Ukraine, and Russia lost the Baltic Provinces. Petrograd was left subject to attack from the Finnish border, only a few miles away, and from the Estonian border, less than a day's journey.

The Government moved to Moscow<sup>1</sup> (March 9) where on March 15 assembled the Fourth Congress of Soviets, which ratified the peace. The Left Social Revolutionaries resigned from the Government, which was henceforth exclusively Bolshevik.

*The Constituent Assembly.*—By adopting as soon as they came to power the Social Revolutionary land programme, the Bolsheviks had assured themselves of the passive support of the peasants and, in the first moments of the revolution, of part of the Social Revolutionary party. The signing of the Brest Peace, against the will even of those Social Revolutionaries who supported the Bolsheviks, but to the profound satisfaction of the peasants and the soldiers of the old army, destroyed the hold of the Social Revolutionaries on the peasants. These two actions prevented the dissolution of the Constituent Assembly from having immediate political consequences in Russia. The idea of a Constituent Assembly played a part in the Russian Revolution profitable at different times to different parties. In March 1917 the promise of a Constituent Assembly made possible that agreement between the Soviets and the Temporary Govt. on which the very existence of that Government depended. As it was clear that immediate elections to the Assembly would have given an immense majority in the Assembly to parties represented in the Soviets, the parties on the Right desired to postpone it, while the demand for its immediate summoning became a useful lever against them in the hands of the Bolsheviks. As the Soviets became more Bolshevik the postponement of the Constituent Assembly became less desirable except by those who hoped that it would be possible by some military coup to suppress the parties of the Left before the elections. When, after the failure of the Kornilov adventure, these hopes were dashed, the Constituent Assembly became in the minds of the anti-Bolshevik parties a means of drowning the extremist vote of the towns in the slightly more moderate vote of the peasants, and active preparations for the elections were at last begun.

When the Soviets took power in Nov. the Bolsheviks, who now regarded the Constituent Assembly as unnecessary and even dangerous since it might mean what was to them a retrograde step from the hegemony of the towns to a democracy in which the towns would be outvoted, were a little hampered by the momentum of the agitation they had carried on formerly against its postponement. They decided to hurry on the elections, to split the peasant vote and simultaneously to declare that the Soviets were, in a revolution, a higher authority than any assembly in which the possessing classes could take part. If by hook or crook they could get the Assembly to confirm the authority of the Soviets, well and good. If not, they would use the methods of Cromwell. Meanwhile the rival parties prepared to make the Assembly a rallying point for a struggle with the Soviets in the capital. The Social Revolutionaries obtained 21,000,000 votes on a party list which included supporters of the Bolshevik revolution, the Bolsheviks 9,000,000, and the Cadets under 2,000,000. Roughly speaking, the Cadet vote was that of the propertied classes, the Social Revolutionary vote was

that of the peasants, and the Bolshevik vote was that of the towns and of a considerable part of the army which, of course, was mainly composed of peasants. The Cadets represented a force active but very small, the Social Revolutionaries a class large but unorganised, scattered and passive, the Bolsheviks a class extremely active, comparatively well organised and, by its domination of the towns, holding all the most valuable strategical positions. The Assembly met on Jan. 18. As soon as it had declared its complexion by electing a Right Social Revolutionary, Tchernov, instead of a Left member of the same party in Marie Spiridonova, as president, the Bolsheviks and the Left Social Revolutionaries allowed it to be told to go home (Jan. 19) by its guards, who expressed the opinion that it had talked enough. An attempt at a demonstration by its supporters was a complete fiasco. It became thenceforward a watchword used indiscriminately by all the anti-Bolshevik parties.

The dissolution of the Constituent Assembly, the temporary settlement of the land question and the signing of the Brest Peace marked the end of the first period of the revolution. The autocracy had gone. The struggle for leadership had ended. Government in Russia was neither half-hearted nor divided against itself, but was a homogeneous body to whose support were committed the most active and determined sections of the town population, while it had definitely assured itself of the neutrality of the peasantry.

#### MARCH 1918 TO MARCH 1921

The second period of the revolution begins with the transfer of the Government from Petrograd to Moscow and the ratification of the Brest Peace. There had been since the overthrow of Kerensky three congresses of Soviets attended by delegates from all parts of the country. The first had appointed the Council of People's Commissars, and the second and third had approved their activities. In all three there had been a considerable and outspoken opposition, but the essential quality of that opposition, had been that it was an opposition of politicians and that the main point at issue (the making of peace) was one on which the Government was taking a line that would have been incumbent on any Government whatsoever. Argument as to responsibility for the past was irrelevant to the plain issue as to whether or not Russia was in a condition in March 1918 to remain fighting. The opposition accordingly was not one of which the Government had any need to be afraid. It had been able to destroy all armed opposition within the country because the forces that opposed it were less willing to fight than its own, weak as these were. It was beginning to build up a new armed force.

*The Cheka and the Red Guards.*—The first nucleus of this force was the institution afterwards known as the Cheka (Chresvy-chainaya Kommissia), meaning "Extraordinary Commission," formed in the beginning in the first weeks after the fall of Kerensky to deal with the attempts to organise drunken pogroms in the capital. The Cheka was given control of the only reliable regular troops, the Lettish Rifles. The leaders of the Cheka included Bolsheviks and Social Revolutionaries, who retained their position in this organisation after the members of their party had resigned from their posts in the Government. For practical purposes it was from the beginning controlled by the Bolshevik party. The scope of its work rapidly widened, and it became in the end the organising centre of the political police and the instrument of the Terror which followed on the beginnings of intervention.

The forces that fought in the earlier stages of the civil war were made up from parts of those regiments that had earliest declared themselves against the Temporary Govt., together with "Red Guards," workmen who had had a day or two of drill and the military equipment of a rifle and a cartridge belt, led by a heterogeneous collection of officers who felt that the future of the country was with the revolution, of officers who felt that they could damage the Bolsheviks most by getting control of their armed forces and of enthusiastic Bolsheviks who had or thought they had some slight knowledge of military technique. It was very soon discovered that dissatisfaction with one

<sup>1</sup> Moscow had been the capital until Peter the Great built St. Petersburg on the swamps at the mouth of the Neva. The Soviet Govt. housed itself where it could. Hotels and private houses became Government offices and Lenin himself lived in a room in the Hotel National before moving into the Kremlin.

government is not a sufficient motive to induce a soldier to risk his life for another. The "Red Guards" were extremely inefficient, and the demobilisation that accompanied the Brest Peace scattered what was left of the old army over the Russian railway system. The soldiers found their way home as seemed best to them, on the roofs and buffers of trains already crammed. During the winter months many froze to death in these positions. Every station was a disorderly camp and groups of soldiers would often be found travelling without particular destination on any train they had been able to board. There was no material for an army to be found in these migrating masses. An army had to be formed from the beginning with people willing to fight. Local soviets formed small bodies independently. Guerilla warfare in the Ukraine formed a training ground for many. As early as Jan. 23 a decree had been issued calling for a volunteer army. By March the Soviet Govt. could command the comparatively stable allegiance of 100,000 men.

*The Dispossessed Classes.*—Meanwhile there was a steady exodus from Russia of the classes who had lost property or privilege through the revolution. Some made their way across the deserted trenches to the Germans. Some joined the Germans in the Ukraine. Some made their way into Finland. Some fled eastwards through Siberia. All took with them a belief, belied by their flight, that the Bolshevik régime could last only a few weeks at most. They played the same part as the refugees from France played in the time of the French Revolution, and even used the same phrases, which were received with the same credulity by Governments similarly disturbed by similar events. Representatives of the Allies in Russia had naturally better means of knowing the old governing classes than the new, and were thus hedged by Russian malcontents from an accurate knowledge of what was happening at their doors. In a revolution the relativity of truth is carried to its utmost limits. Even for the most honest men engaged in a civil struggle the truth tends to be anything that tells against their opponents. In Russia in 1918 it was impossible to expect dispassionate witnesses.

The landlords had seen their estates taken from them by a rabble of peasants who, only 80 years before, had been only serfs, a species of domestic animals rather less valuable than the best horses. Manufacturers had seen their factories turned into debating clubs and themselves and their managers at the mercy of committees appointed by the workmen. Politicians who had spent the best years of their lives in attacking the autocracy had been swept out of the way in favour of men whose theories they despised and of whose incompetence they were convinced. Revolutionaries with a long record of prison and exile were outraged to find that the revolution could do without them. Shortage of everything and rapidly rising prices were natural sources of wide but impotent discontent. Add to all this the fact that the German advance in the West in March 1918 made the representatives of the Allies desperately aware that the country to which they were accredited had by withdrawing from the War eased the task of the Germans, and it is not surprising that, in spite of the lesson of 1917, they were ready to listen to those who promised that if only foreigners would help them to throw out the Bolsheviks they would be able to undertake themselves the more difficult business of fighting the Germans.

*Diplomatic Relations.*—Intervention did not begin at once, and the Bolsheviks were so far persuaded that Germany would attack them again the moment she felt strong enough to do so, that they were building their new army in the belief that Germany would be the first foreign enemy they would have to meet. When the Germans were advancing in the last days before the signing of the peace, the French military mission offered Trotsky French and English instructors for his newly formed regiments. This offer was accepted by the Russians, but was withdrawn. Now, when the Germans were still advancing (in the Ukraine) Piatakov, whose brother had been flogged to death there, asked for quick-firing rifles to use against the Germans in guerilla warfare. His request was refused, and it gradually became clear that intervention might come equally soon from either side. The Bolsheviks became increasingly conscious that Russia's diplomatic

relations with the Allies were of a most abnormal kind. The Soviet Govt. had not been recognised by the Allies, whose representatives, however, were in touch with it, but were in much closer touch with those groups of Russian subjects who were opposed to it.

The British embassy left through Finland. The French was just too late to get through before the Germans occupied Finland on the invitation of the White Finns. English diplomatic representation was entrusted to Mr. Lockhart, formerly Consul-General in Moscow, who with a small staff accompanied the Soviet Govt. when it moved to Moscow. The American, French and other embassies and legations moved to Vologda, a little country town which offered the advantage of two possible lines of flight, to Archangel and through Siberia, and was a very long way from the new capital of Russia. In Moscow there were several military missions of the Allies, and consulates of various nations took upon themselves the management of international politics. If it had not been that serious things were at stake the diplomatic corps in Moscow and Vologda in 1918 would have provided good material for comedy. Some nations (including Great Britain) had several representatives of widely differing political convictions, and as the hopes of each tended to become beliefs it was hard to tell what was or was not the policy of any particular country. The only properly accredited ambassador in Moscow was Count Mirbach, the German, whose business it was to observe, to report and to keep the Bolsheviks aware that they lived under the continual threat of a renewal of the War.

The months of March and April in Central Russia were spent comparatively peacefully, though the bloody suppression of the Finnish revolution, the advance of the Germans through the Ukraine<sup>1</sup> and the resuscitation of White forces in the southeast were a clear warning of what was to come. Still, a British and American mission travelled from Moscow far into Siberia, and reported perfect order until it reached the district affected by the raids of White officers from over the Chinese frontier (see **SIBERIA**).

*The New Organisation.*—Over a very large area the revolution had a few weeks in which to establish itself. The Soviet system showed itself capable of replacing the old administrative machine. The Government in Moscow was rapidly organising a new civil service. In the country the peasants were settling the land question in their own way. The railways were gradually disburdening themselves of migrating soldiers. The seizure of the banks and the rapid inflation of the rouble were showing themselves more powerful than the decrees that accompanied them—and, as it were, explained their effects—to bring about a social revolution in the towns. Saved money was like fairy gold that turned to dry leaves in the night. The very unwillingness of the propertied classes to believe that the Communist régime could last more than from one week to the next contributed to their disaster. Their action, which consisted in doing nothing, may be described as a general strike of the propertied and privileged classes at a time when their strike funds were not only being spent day by day but were also rapidly turning into waste paper.

Inability or unwillingness of private manufacturers to keep their factories working under conditions which deprived them of effective control eased the task of the Government in nationalising large industry. The workmen saw in nationalisation a guarantee that they would at least get paper salaries regardless of the rapid fall in productivity, a fall due in part to the effects of the War and in part to the effects of the revolution, the disappearance of incentives to production and the substitution of political for productive activity. Shops were closing down for lack of goods, but there was as yet small sign of the "militant communism" that was to come. Speeches by Lenin make it clear that, given peace, he was prepared to proceed at once with what became known years afterwards as the "New Economic Policy." Intervention and the consequent growth of civil war on an enormous scale made that impossible.

<sup>1</sup> The Ukrainian Rada which had invited the assistance of the Germans was replaced (April 25) by the dictatorship of Gen. Skoropadsky.

*Intervention.*—Intervention was begun by the French use of the troops of Czechoslovak prisoners of war that had been formed in Russia to fight against the Central Empires. Immediately after the signing of the peace of Brest (March 3) these troops declared themselves under the French supreme command, and preparations were made, in spite of German protests, to send them to France. Russia was at this time at least formally at peace with Germany, and as a neutral country could not properly allow the transit of armed troops. The troops, however, were allowed to start on the way to Vladivostok, and had reached various stations on the Siberian railway and branch lines leading to it when signs of impending trouble caused Trotsky to order their disarmament. This was the signal for them to seize (in the last days of May) a long stretch of the railway and a number of towns. They did not proceed towards Vladivostok, but actually advanced westwards, taking Samara on June 8, where a number of members of the Constituent Assembly formed a Government while, similarly sheltered by these disciplined troops, a temporary Siberian Govt. was formed on June 15. Dutov raised the Orenburg Cossacks. Krasnov renewed activity on the Don. The Germans had pushed eastwards through the Ukraine, and within a few weeks the territory held by the Soviets was only a small part of Russia, consisting for the most part of districts in normal times either not self supporting or barely capable of self support. The revolution was cut off from the main sources of iron, coal, cotton, oil, meat and bread.

*The Social Revolutionaries' Revolt.*—The critical month was July 1918, when the Soviet Govt. was faced within its now strictly limited territory by a revolt from the Left, which had as its object the provocation of further intervention by Germany, and revolts from the Right, which had as their object the encouragement of further intervention by the Allies. The revolt from the Left came first. The Left Social Revolutionaries who had opposed the peace of Brest and wished for "not war but revolt," believing that the cause of revolution would be best served by inducing a German occupation of Russia and destroying that occupation by guerilla warfare of the kind that was keeping the Ukraine in flames, decided to force the Communists into accepting their point of view. At the Fifth Congress of Soviets which met in the first week of July they made a violent demonstration against Mirbach, and accused the Bolsheviks of doing nothing but obey his orders. On July 6 one of them assassinated Mirbach in the house in which the German Embassy was lodged. On the same day they raised a revolt in Moscow, seized a considerable part of the town, and even fired with artillery into the Kremlin. Meanwhile the Communists put a cordon of troops round the Congress. All Communists left the building, and the bulk of the Social Revolutionary members were thus detained. The revolt was suppressed by the evening of the next day, a final engagement taking place outside the town. On hearing of this revolt, Muraviev, a romantic adventurer who had taken an active part in the defence of Petrograd and in the fighting in the Ukraine and was now commanding the Red forces against the Czechs, mutinied unsuccessfully and shot himself. Meanwhile Social Revolutionaries of the Right, encouraged by French promises and believing that their rising would be the signal for an immediate advance of interventionist forces from the north, attempted revolt in several towns. They were most successful under Boris Savinkov in Jaroslavl, where they obtained possession of the town, killed a number of supporters of the Soviets, and were only defeated after a siege, the town suffering severely on account of the inexperience of the troops who, deserted by their officers, did not know when to stop bombardment and blew part of the town unnecessarily to pieces.

While the revolt in Jaroslavl was still in progress an attempt was made to persuade the colony of Allied Representatives at Vologda to come to Moscow. There were several motives for this besides the naïve belief that these representatives would be less hostile to the Soviet Govt. if they were in closer contact with it than with its enemies. On the one hand the Bolsheviks did not know how the Germans would react to the murder of their ambassador, and in the case of a renewal of the War they

would have been prepared to ask for Allied help in organising and arming their defence. On the other hand they feared that the Left Social Revolutionaries would be likely to blow up an Allied ambassador or two in order to prove that they had not been agents of the Allies in killing Mirbach, and in order to force the revolution to stand alone without dependence on "imperialists of either camp." Such an event would force Allied intervention on a large scale, which the Bolsheviks still hoped to postpone. They believed that they could better guard the representatives in Moscow than in an isolated village like Vologda in a district where the Jaroslavl revolt showed that their authority was none too secure. The Allied Representatives, however, reasoned that the murder of Mirbach in Moscow was by no means a justification for their going to that city. Intervention had already begun, and was going to develop, and they determined to stay where they were. A British Representative (independent of the Lockhart mission in Moscow) was at Vologda, and a British commercial delegation of four arrived to investigate conditions. It came to Moscow, stayed two nights there and left for the north. The Allies had landed additional troops at Murmansk, and were preparing to take Archangel. The Japanese had sent warships to Vladivostok in Nov. 1917, made a landing on April 5 and on June 29 1918 helped the Czechs and others to overthrow the Soviets in the town.

*The Terror follows Intervention.*—As in the French Revolution, the intervention of foreign Powers increased the bitterness of the struggle. Political opponents became traitors, and in Russia were repeated all the horrors that followed intervention in France. The deposed Tsar with his family had been moved from Tsarkoe Selo to Tobolsk during the Kerensky régime. In the spring of 1918, for fear of counter-revolutionary rising in Siberia, they were removed to Ekaterinburg (May 2). The advance of Czechoslovak troops and of White troops formed after the Czechoslovak revolt put that town in immediate danger of White occupation, and the local Soviet, rather than risk their falling into the hands of the other side, shot the whole family at night on July 16 in the basement of the house in which they had been interned. The fact was announced on July 18 to the Praesidium of the Central Executive Committee in Moscow which, in view of the circumstances, approved the action of the local Soviet. The news of this killing, horrible in itself, aroused more excitement abroad than in Russia, where, in the prevailing dearth and precariousness of living, life was the only thing that was held cheap (see NICHOLAS II.)

On July 2 allied troops had landed at Murmansk, on the 31st they took Onga, on which day the Czechs took Simbirsk on the Volga. On Aug. 1 the Czechs took Ekaterinburg, on the 3rd Archangel was occupied by the Allies. On the 10th Kazan was taken by the Czechs, and troops advancing southwards from Archangel took Shenskursk. It seemed that the revolutionary troops could do nothing but retreat when faced by forces stiffened by a leaven of foreigners. The Bolsheviks had proceeded from voluntary enlistment to conscription, and now mobilised ex-officers of the old army to supply, under compulsion, the lacking knowledge of military technique. To these officers they attached Commissars whose business it was to inspire the soldiers and to watch for treachery on the part of the officers, the sympathies of many of whom were naturally on the side of the Whites. Workmen from the factories, partisans driven from the Ukraine and sailors from Kronstadt had to fill the part on the Red side that was taken by trained foreign troops on the side of the Whites. The republic, almost throttled at the start, learnt to fight in the course of the War. Civil war is necessarily of a different character from that of an ordinary war between nations. Mobilisation of conscripts on both sides formed a huge mass of potential deserters. The smallest initial victory was enough to set this current of desertion flowing, while a successful counter-attack

<sup>1</sup> The detachments which had been in Murmansk during the War had remained. They were now largely reinforced after agreement with the local Soviet which imagined that they were to serve as a defence against the Germans in Finland and by no means for intervention in Russia.

would be enough to turn the tide and set it flowing in the opposite direction. Much depended on the administration of occupied territory in such a way as to prevent the growth of discontent in the rear of the fighting forces. In the territory occupied by the Whites, the peasantry were soon given reason to fear that a White victory would mean the return of the landlords. This fear outweighed the requisitions of food, beasts and men, which were carried out by both sides. In the end, it probably decided the issue of the War.

On Aug. 30, a woman Social Revolutionary attended a meeting of working men addressed by Lenin in Moscow, and, waiting for him as he came out, fired two bullets into him at scarcely more than arm's length. Lenin was very badly wounded, and for some time it was thought impossible that he should survive. On the same day another Social Revolutionary killed Uritsky, one of the chief Communist leaders left in Petrograd. These two events were the signal for a wholesale revolutionary terror. Five hundred persons were executed in Petrograd alone as an immediate reprisal.<sup>1</sup> The diplomatic and consular representatives of the Allies, who had hitherto been unmolested in Moscow in spite of the fact that the Powers they represented were actually at war with the republic (Archangel had been taken a month before), were arrested, Mr. Lockhart being accused of complicity in a plan to raise a mutiny in the Lettish troops and to seize the Bolshevik leaders. All were subsequently released, Mr. Lockhart's Mission being exchanged for Bolsheviks arrested in England. The Soviet Govt. abandoned all hope of coming to an arrangement with the Allies, and realised that it was already engaged in a struggle from which it would either emerge victorious or not emerge at all.

*Progress of the Civil War.*—It was as if this psychological burning of boats had an almost immediate effect in stiffening the Red troops. During this grim month and the month that followed they obtained at least small victories on all the fronts that were more immediately dangerous. By the recapture of Kazan, Samara, Simbirsk and Syzran they recovered the Volga as a line of defence behind which they could prepare for an advance towards the Urals. At the same time they made impossible a juncture between the troops advancing from Archangel and those which had been advancing from Siberia under cover of the Czechs. The Archangel front moved southwards, but was not of great importance, being in a district with only the most limited ways of communication, besides being isolated and far from any vulnerable nerve centre.

When, on Nov. 6 1918, the All-Russian Congress of Soviets met in Moscow, the republic was holding its own, and news was coming from the West that greatly strengthened its belief that it had only to hold out a little longer before the idea which it represented was victorious throughout Europe. Austrian and German regiments exposed to the infection of revolutionary ideas had mutinied in Mohilev and Rovno six weeks before. The discipline of these troops in the Ukraine was falling to pieces. Now came news of the formation of Soviets in Kiel, Berlin and Budapest, the abdications of the German and Austrian Emperors and the armistice on the Western Front. The Congress was one of the wildest enthusiasm. For it, not Allied victory but revolution in Germany had made a scrap of paper of the peace of Brest, which it now (Nov. 13 1918) formally annulled. Lenin seemed justified. Russia was no longer alone. The members of that Congress could hear the tramp and see the banners of that world revolution on which their hopes were based. It took several years of bitter disappointment to dim the sound and vision of that triumphal march.

Although the collapse of Germany made it impossible for Russian emigrés to continue to persuade the Allies that in fighting the Soviet Govt. they were fighting the Germans, its immediate effect was that Allied ships passed through the Dardanelles into the Black Sea and through the Belt into the Baltic.

<sup>1</sup> Latsis (*Two Years Struggle on the Internal Front*) says that 8,389 persons were shot by the Extraordinary Commission (Tcheka, later Ogpu) in 1918 and 1919 in the 20 Governments of Central Russia alone. Seventy-five per cent of these were shot in the later months of 1918.

The Germans in the Caucasus were replaced by the Allies. The anti-Bolshevik Governments of the Baltic States were supported by the Allies instead of by the Germans, and the revolution rolling forward on the heels of the retiring Germans found itself arrested by forces that the Allies were now able to equip abundantly with the material no longer needed for the war with Germany. This continuance of the War on the part of the Allies after the annulment of that excuse for interference that was provided by the Brest Peace had two other effects. On the one hand it strengthened opposition to this new war in the Allied countries, whose peoples to a large extent considered that the defeat of Germany and not interference in Russia was the object for which they had been enrolled. On the other hand it gathered to the support of the Bolsheviks a great number of officers who had considered that the Brest Peace was the main reason for opposition to them and held that, the German question being eliminated, the war in Russia was a national war in which the Soviet Govt. was resisting foreigners who were using Russians as their instruments in weakening a country that had been a great Power until it had overstrained itself on their behalf. They were prepared to accept the revolutionary watchwords for the inspiring of a national defence. Nor were these officers alone.

In the south the forces opposed to the Bolsheviks were headed by a series of dictators, L. Kornilov, Alexeiev, Denikin, surrounded by persons who made no secret of their distaste not only for the Bolsheviks but for politicians far to the Right of them. In the East, the Committee of Members of the Constituent Assembly had been succeeded by the Directorate, which took over the four existing White Governments in Siberia, and Admiral Kolchak had been proclaimed supreme ruler at Omsk on Nov. 18. Members of the Constituent Assembly had been taken from prison and killed by officers who were allowed to go unpunished. The result of this was that members of the Constituent Assembly escaping from Kolchak publicly threw in their lot with the forces on the other side of the barricade. Even in Archangel a comparatively moderate Government under N. Tchaikovsky was seized by a group of officers and only released on the insistence of the Allies. It rapidly became clear that the choice was not between the Bolsheviks and a more moderate Government, but between the Bolsheviks and extreme reaction. The Red Terror was matched by a White Terror that affected far larger sections of the population. Refugees from the country held by the Whites brought into Soviet Russia accounts of such treatment of the working classes as enormously increased the will of those in Soviet Russia to see the struggle through regardless of the daily increasing hardships of a starving and beleaguered camp. If 1918 saw the beginnings of intervention and civil war on a large scale and the gradual growth of disciplined forces during a period of extremely unstable internal equilibrium, 1919 saw those forces become armies to meet more serious attacks from without, which, however, were accompanied by increasing stability within.

The revolution owed much to its opponents, who repeatedly gave it proofs that it was forced to fight in self defence. An example of this was given by the reaction of Reds and Whites to Mr. Lloyd George's and President Wilson's proposal (Jan. 22 1919) that representatives from either side should meet for a conference on Feb. 15 on the island of Prinkipo near Constantinople. The Reds expressed their willingness to come to that aloof island (though they would have preferred a place where their negotiations would have had a better chance of being overheard by the working classes of other countries, to whom they looked to bring intervention to an end), provided that the Powers on their side would undertake not to intervene in the internal affairs of Russia. They even offered to negotiate on a basis of frontiers to be determined by the position of the various forces at the time, which would have given the whole of Siberia and huge districts of European Russia to their enemies. The Whites, confident in the attacks they were preparing, encouraged also by promises of further assistance from the Allies, refused through their representatives in Paris to consider any negotiations whatsoever, and thereby knocked the bottom out of any agitation in Soviet Russia for an end of the civil war. The moderate Socialist

parties in Russia naturally declared that, while disapproving of the Bolsheviks, they would yet support them against all intervention from without. The war continued. Huge supplies of military equipment were given to the Whites. The Archangel front had been pushed southward. Kolchak was striking across the Urals, and when the White forces in the south promised to move northwards it was confidently assumed abroad that the end of the struggle would come during the summer.

That assumption was based on a comparison of material forces. It did not allow for that strange, incalculable  $x$  of revolutionary enthusiasms which, in Russia in the 20th century as in France in the 18th, continually provided miracles for the discomfiture of logicians. In Russia, thanks to the domination of a single party, there were none of the struggles between tendencies and, thanks to the extraordinary discipline of that party, none of the struggles between individuals that made unity among the Whites impossible. Enthusiasm was not dissipated piecemeal, but directed hither and thither where it was most needed. The Communist party took every member it could spare from the work of organisation, and sent him to the weakest place in the defence. The trades unions did the same. Throughout the Civil War the Communists adopted the opposite method to that of rulers who exaggerate victories and minimise defeats. Huge maps were set up on boardings in the streets of the towns with a thick black line to mark the encircling front. Day by day during the White advances the black line was moved nearer to Moscow. Defeats intensified instead of disheartening the defence, in spite of the appalling conditions in the besieged camp. In this war few of the wounded could hope to survive, for the blockade did not allow the importation even of anaesthetics or the necessary drugs. Outside the territory of the Soviets to be a member of the Communist party was a crime punishable by death. Captured Communists were shot at once. Yet at the worst moment, Oct. 1919, when White forces were within striking distance of Moscow and of Petrograd, thousands of working men poured into the party.

The year 1919 began with the advance on a wide front of Kolchak who, with the whole of Siberia behind him, pushed his lines far into European Russia, and in April reached Kazan and Samara on the Volga. The Communists threw all that they had against him, denuding their other fronts, and in July threw him back over the Urals just in time to let them reorganise to meet the rapid advance of Denikin from the south. Denikin, thanks to a destructive cavalry raid behind the Red front, advanced with extreme rapidity, and in the autumn took Orel (Oct. 13) within easy reach of Moscow. Here he was held for just long enough to allow the effects of his administration in the country he had occupied to show themselves in his rear. So long as Denikin's army consisted exclusively of officers it was a dependable force, but with successive mobilisations as he advanced his swelling army became much less unanimous in wanting him to win. The peasantry judged by the behaviour of his officers what fate awaited them in the event of his victory, and mutinies and revolts soon made his threat to Moscow much less formidable than it seemed upon the maps. He was pushed back from Orel (Oct. 19), and having once begun to retreat could not stop.

But the blow from the south was still to be parried when, with the help of English tanks, an army under Yudenich moved on Petrograd, took Krasnoe Silo (Oct. 16) and came within sight of the Cathedral of St. Isaac. Yudenich seems to have believed that Petrograd would rise to welcome him. No doubt there were plenty of people in Petrograd who looked forward eagerly to his arrival. But these were a small minority who remained indoors while children ran about banging tin cans and waving red rags and their elders dug trenches, set up barricades and prepared for street fighting. Trotsky went to Petrograd to organise the defence. It is possible that even if Yudenich had entered the city his forces, which were not large, would have been destroyed in the streets. At the same time there were several days (Oct. 16-21) when all Moscow believed that Petrograd had fallen or was on the point of falling. Preparations had actually been made for the housing of the refugees. Yudenich was defeated at Pul-

kovo (Oct. 21), driven back over the Estonian frontier, after his officers, before retreating, had sacked the Palace of Gatchina.

*Collapse of the White Armies.*—The Yudenich adventure may on the whole be considered as having been a help to Soviet Russia. In failure it destroyed many illusions, and while it still seemed likely to be successful it had greatly contributed to the desire of the Estonians to conclude peace. Estonian troops had advanced with the Russian Whites, but Yudenich's officers, unwisely, did not conceal their contempt for the "potato republic" (an allusion to the chief agricultural produce of Estonia) and, resentful of the national airs put on by what they regarded as a Russian province openly spoke of settling accounts with the Estonians as soon as they had dealt with the Bolsheviks. The Estonians realised that there was little to be gained for Estonia by helping reactionary officers to conquer Russia. In spite of warnings, even threats, addressed to them by the French, they began negotiations with Soviet Russia on Oct. 5 1919, which ended with the signature of a peace treaty on Feb. 2 1920. Estonia's belief that peace was possible made war more difficult for other small Powers. On Jan. 16 1920 the blockade was formally lifted by the Supreme Council. The ring surrounding Soviet Russia was no longer complete. England had already given up active intervention.

Meanwhile Soviet Russia was rapidly recovering the old Russian frontiers. Kolchak had never recovered after the blows of June and July. The burning of villages, wholesale floggings and shootings had roused the whole of Siberia against the Whites. Soviet Russia recovered Omsk on Nov. 15, Semipalatinsk on Dec. 11, Tomsk on Dec. 20, Krasnoyarsk on Jan. 8 1920. On the same days in the south the Red cavalry entered Rostov. On Feb. 19 Soviet troops entered Archangel. On March 2 they took Irkutsk, on March 13 Murmansk, on March 24 Vladikavkaz. With the withdrawal of foreign support and disorders in their own rear, the Whites collapsed with such suddenness that town after town was taken by internal revolt long before their inadequate transport allowed the regular troops of the Reds to reach it.

Three psychological moments tended towards the abandonment of intervention: (1) discontent in all countries at what seemed to be an unnecessary prolongation of war after the defeat of Germany; (2) a wide feeling among the working classes of all countries that a war against the revolution in Russia was indirectly a war against even non-revolutionary labour at home; (3) growing impatience with the Russian Whites who, wherever they were in power, showed an incapacity for government equalled only by their capacity for quarrelling among themselves. It came to be realised by a growing section of opinion in Great Britain that the fact that Russian Whites asked for foreign help against their own countrymen was in itself a sufficient proof that such help ought not to be given. Two Powers only were unwilling to give up intervention in Russia. Of these one was Japan, which had definite territorial designs in Eastern Siberia and retained for some years the Russian part of the island of Sakhalin. The other was France. The French were more grievously affected than the English by the non-payment of interest on the Tsarist debts. They were also afraid of a German revenge for the Peace of Versailles and horrified at the thought that they had lost their Russian ally. They had therefore set their hands to the carrying out of a contradictory policy, on the one hand to create a big Poland to take Russia's place in Germany's rear and on the other to help in the creation of a new Russia which should feel gratitude to France. Expressions of these policies were the Polish attack on Russia in 1920 and the desperate recognition of Wrangel (Aug. 11) by M. Poincaré immediately before that general was driven into the sea.<sup>1</sup>

*The Polish War.*—For a few weeks in the spring of 1920 it seemed that this was to be the first year of comparative peace, and in that hope the Russians offered to conclude a treaty with

<sup>1</sup> Nevertheless Poland and the Baltic States received a formal warning from the Supreme Council in London in Feb. 1920 advising them not to continue a war which might be injurious or to make any aggression against Russia.

Poland on the basis of the frontiers the Poles then held, which included a good deal of ethnographically non-Polish territory. The French, however, had not accepted the Estonian peace-making with equanimity, and the Poles, assured of French good will, money and munitions, and still dreaming of a Great Poland which was to stretch from the Baltic to the Black Sea and be a sort of Hadrian's wall against the barbarians of the East, advanced further into Russia, and on May 8 took Kiev. This attack by the Poles had the effect of further consolidating elements in Russia otherwise hostile to the revolution in support of what was, after all, the only existing Russian Government. The Poles completed that nationalisation of the Soviet Govt. which had been begun by the interference of the Allies. In a few weeks the Russians routed the Poles, and found themselves in a position to invade Poland. Trotsky was against pushing on. Lenin allowed political considerations to outweigh the views of the military experts. His view, strongly supported by the many Polish revolutionaries who were on the Russian side and played in this matter the same part that the Russian emigrés had played in persuading the Allies to intervention, prevailed. A few weeks later the Russians were at the gates of Warsaw.

But the advance of the Russians into Poland had the same result as the advance of the Poles into Russia, a consolidation of national feeling in the invaded country. The French, besides guns and ammunition, sent the Poles a leader, General Weygand; and Wrangel from the Crimea, acting (whether he intended this or not) as an ally of the Poles and the French against Russia, began an advance in which he had very considerable technical assistance. The Russians' retreat before Warsaw was as rapid as their previous advance, and raised in the minds of their enemies hopes of an immediate and general collapse. This, however, did not follow. The Poles were held and in Oct., by the Peace of Riga, agreed to frontiers which were approximately those which they could have had without fighting in Feb.; and by Oct. 17, the Revolutionary Army had occupied the whole of the Crimean peninsula, Wrangel with the remains of his troops escaping to Constantinople. Peace with Lithuania and Latvia had been signed in July and Aug. during the Polish war. Peace with Finland was signed in October. Raids continued to be made into Russia over the frontiers of countries nominally at peace with her; much of the banditry that naturally follows civil war remained to be put down; but civil war on a large scale had ended.

*War Communism.*—It is usual, even among Communists, to describe the period of civil war as one of "militant communism." But when the economic measures of those years are separated from the words that accompanied them, it appears that there was little difference in principle between them and measures adopted in other countries during the World War, which again were not different in principle from those that are forced upon any besieged community. Russia suffered from seven years of war. It is not surprising that measures of rationing, of monopoly, had been carried further in Russia than in countries which suffered from only four. Industry in Russia was not highly developed before the War. Russia was accustomed to export agricultural produce and raw material and to import manufactured goods. During the War she could do neither the one nor the other. Her own industry suffered from lack of transport, fuel and raw material and from a catastrophic fall in the productivity of labour. The one industry that had to be maintained at the expense of all others was that of munition-making, which does not provide goods in exchange for which peasants will willingly give corn. In such circumstances whatever measures may be taken amount in the long run to the requisitioning and rationing of existing stores. The towns being unable to produce goods to exchange for corn, agriculture, like industry, became a State monopoly in the sense that all produce over and above the needs of the producer was taken by the State to feed the armies and the towns. Private trade in bread was forbidden because its existence made it more difficult for the State to obtain corn. The co-operative societies were turned into a distributing apparatus to serve the whole of the town population. The rationing of the inadequate supplies distinguished in other countries between the

civil and the military population. In Russia it had to go further, and among the civil population to distinguish between those whose work required more physical effort and so more food than those whose work could be got through with less. With a view to the future, milk in the towns was distributed exclusively to children. All these were practical measures which would have been forced on any country similarly impoverished and besieged.

In all countries similar measures taken during the War tended towards State and away from private control. The difference between these measures in Russia and in other countries lies in the point of view of the Government applying them with regard to what may be called their by-products. The Russian Govt. was not like the Governments of other countries, anxious to disburden itself as soon as possible of the factories that during the War had come into its hands. It rejoiced instead of lamenting over the rapid inflation of the currency because this, making money meaningless, facilitated the weakening of the propertied classes. The requisitioning of corn was in the hands of committees of the poorer peasants to whose interest it was to see that the rich peasants did not hold back their stores. The result of this was a general levelling among the peasantry, during which the conflict of interests between rich and poor peasants guaranteed the Government against active resistance by the peasantry as a whole.

It must not be imagined that the Communists were able to make of these measures a complete system. An essential link in the system was missing in the failure of the towns to produce goods to be distributed to the peasants. The factories handed over what they made, but they did not make enough, and a proportion even of what they made was stolen by the hungry workers to exchange for food on the markets that still existed as safety valves for the private trade which, though forbidden, was carried on by "bagmen" who themselves brought sacks of produce to the towns, running the gauntlet of railway and town police and taking back to the country whatever they could get. The existence of this illegal trade meant that the peasant had a chance of getting something for his produce and, while it kept the peasant cultivating, compelled even the Government organs of supply to have recourse to the very markets that it had forbidden. If the system could ever have been put into complete operation money would have ceased to be necessary at all. As it was the printing presses supplied the Government and its employees with the means of buying on the illegal markets the food they had not been able to bring to the towns themselves. Money tended to become valueless (it was easier to buy things from the peasants with a cake of soap or a little salt), but the existence of the illegal market made a use for it and a demand for it just sufficient to keep the rouble alive.

*Poverty and Privation Following the Civil War.*—Life in Russian towns reached its lowest level in 1920. The almost complete breakdown of transport made it impossible to bring to the towns even the whole of the inadequate supplies that the Government apparatus had been able to get to the railways. In Jan. 1920, the number of locomotives in working order had fallen from 17,000 (1914) to under 4,000, less than a quarter of the number that had been barely sufficient to maintain a very low standard of transport at the beginning of the War. The enlargement of the revolutionary area of Russia that accompanied victory in the Civil War increased the length of the lines of communication much faster than it added to the rolling stock. At the worst moments of the civil war, 80% of the railways had been in the hands of the Whites, and during the struggle, apart from damage to rolling stock and lines, 3,672 railway bridges were destroyed and 381 railway dépôts and repairing shops. Military operations had to come first, and the towns had to do with the crumbs from the soldiers' miserable commissariat. Every town dweller was underfed. There was no fodder for horses. Sledges disappeared. The cleaning of the streets was left to the spring thaw and the autumn rains. All shops excepting State bookshops and a few half empty co-operative stores were closed. Wooden houses were being pulled down to serve as fuel, lack of which prevented the proper heating even of Government offices, brought the tram-

ways almost to a standstill and cut down the supply of electric light. Actors played in unheated theatres to audiences shivering in out-door clothes. Typhus carried off thousands of the population. The very working class on which the Government based itself began to disappear, the town workers—most of whom in Russia retain a connection with their villages—returning to the country, where there was food enough and a skilled man could easily earn a living. During the previous year one in every three workmen had left Moscow or ceased to be a workman. Wagons clogged the stations, because there were none to unload them. Food rotted, and timber lay where it was useless, because neither food nor fuel could be brought to the places where they were desperately needed.

The problem before the revolution was to get work done when it was impossible that it should be immediately rewarded. A comparatively efficient organisation of the factories had been worked out; the more extreme forms of workers' control ceased, the technical staff in the factories as in the army being freed from dependence on the caprice of their subordinates. But the rewards were small and uncertain, and the actual physical capacity of the underfed workers was low, and much of it had to be spent in pursuit of food to supplement their rations. By propaganda and example the Communists succeeded in inducing a high level of self-sacrifice among their own rank and file. Groups of Communists undertook what became known as Saturdayings, when, in holiday hours, they combined in all kinds of labour, shifting wood, unloading trucks, etc., and many non-Communists joined voluntarily in what presently became a duty for members of the party. As the civil war slackened armies not actually fighting were turned to doing whatever work could be done wherever they happened to be. These were called "Labour Armies," and issued "Bulletins from the Labour Front" announcing the building of a bridge as formerly they had announced the capture of a town.

From these beginnings came industrial conscription, a measure never put into general practice but designed in the first place to prevent the complete exodus of the workmen from the towns and to secure the preparation of fuel by peasants in the neighbourhood of the railways. If it had been possible to feed as well as to conscript something might have come of it. As it was, it was found useful in getting things done that were urgently needed. It failed as a general means of organising labour, and was probably more useful to the opponents of the revolution abroad than to the Communists in Russia. Its chief supporter in Russia was Trotsky, who certainly succeeded in getting valuable work in the restoration of the railways done by the labour armies, and was also able to raise the number of repaired locomotives and wagons. Transport was in 1920 the key position of the struggle and though Trotsky's critics pointed out that the productivity of a man in a labour army was less even than that of an ordinary workman, he could reply that it was better to get work done slowly than not to get it done at all. In transport things did by the end of 1920 show unmistakable signs of improvement and improvement here promised it everywhere else. During this period were finished the land works for a huge electric power station on the Volkhov, a power station at Kashira and another on the Shatura peat mosses (which was promptly destroyed by fire). In circumstances in which it seemed possible that Russian civilisation would disappear altogether, starving and ragged engineers were planning the future electrification of Russian industry and rationalisation of Russia's industrial geography.

#### MARCH 1921 TO MARCH 1926

*Peasant Discontent.*—The end of the civil war removed a motive that had partially reconciled the peasants to much that they disliked in the revolution. They had no longer need to fear a return of the former landowners and, whereas during the War they had grudgingly submitted to the seizure of such corn as they could not hide, they were very certain that they had no intention of feeding the towns in peace-time for nothing. What, they asked, was the good of getting rid of the landlord if you were not allowed to do business with your own crops? Nor was

this the feeling of a small class of rich peasants alone. The general levelling brought about during the years of the War had made the peasants more or less homogeneous and united, though not organised, in sullen discontent. Their mood was naturally reflected in the army which was largely composed of their sons. At the same time the removal of the driving motive of the War freed other discontents for expression that would not have been risked while there was still an armed enemy to profit by it. Shortage both of food and fuel in the winter months brought about a crisis. Not only were the peasants hostile, but the cold and hungry workmen of the towns were near the end of their patience.

In Feb. 1921 there were strikes in the Petrograd factories. There was similar trouble in Moscow, where some of the regiments, without revolting, showed their very natural sympathy with the workmen. Then, in March trouble in one of the battle-ships turned into a general revolt at Kronstadt (March 2). This in its beginnings was explicitly a family quarrel within the revolution, and had none of the aims of a White revolt. But the enthusiasm with which it was greeted by the Whites outside Russia brought about instant calm in both capitals, where the workmen realised that it might mean a resurrection of the civil war. Kronstadt was retaken (March 17) after a first attack over the ice had failed, and once more there was apparent peace.

*The New Economic Policy.*—The Tenth Congress of the Communist party (at that time 730,000 members) met on March 8 1921 in the atmosphere of those events, and on the invitation of Lenin took the first step towards that New Economic Policy which had been in his mind and on his lips in 1918 when intervention and the consequent development of the civil war had postponed it for three years and brought about the greater part of what was known as "militant communism." This first step did not seem a very big one, nor did it promise much more than to lessen the discontent of the peasant and supply him with a motive for increasing instead of decreasing the area of land that he thought it worth while to till. Instead of the system of assessing the surplus corn and requisitioning it (at a fixed price in practically worthless paper money) it introduced the payment of a tax in corn, which was to be less in amount than the previous assessments and was to leave the peasant free to dispose of what he had left after the tax was paid. The deficit in the State's supply of corn after receipt of the tax was to be made up by exchanging manufactured goods for corn, and this operation was to be left to the co-operative organisations. This meant that buying and selling of corn would no longer be a criminal offence and that the State would have to compete with private local traders for the surplus corn that the peasant had to sell.

Weakness in the co-operative organisations, lack of manufactured goods, together with the famine of 1921, presently hurried the party along the road on which they had thus tentatively set foot.

*Reopening of External Relations.*—Another influence, in the same direction was the reopening of relations between Russia and the rest of the world. Kronstadt was still in the hands of the mutineers when, on March 16 1921, a Trade Agreement between Russia and England was signed in London and a treaty between Russia and Turkey was signed in Moscow. The signature of England was an encouragement to the small border states who had felt hitherto that they were risking the disapproval of England as well as of France in withdrawing from a suicidal conflict with Russia. The Trade Agreement, while not establishing normal relations, set up a *modus vivendi* which made trade possible between the two countries. On May 6 the Treaty of Brest-Litovsk, denounced in 1918, was replaced by a new agreement between Russia and Germany, signed at Berlin. A treaty with Hungary, arranging for the return of Hungarian prisoners of war, was signed on July 28. Norway followed on Sept. 2, a treaty with Mongolia on Nov. 6 and a Preliminary Trade Agreement with Italy on Dec. 6. At an economic conference held at Riga with the Baltic States (Oct. 24-31) the basis of an agreement on transport questions, essential to Russia's export, was reached. Foreign Trade presupposed the possibility of Russian export.

Russian export presupposed a surplus in the hands of the Russian Govt., which retained a monopoly of Foreign Trade. That surplus had to be paid for and the need of payment became the dominating motive of the next period of the Revolution.

*The Georgian Revolt.*—At the moment of the revolt in Kronstadt there was in progress a revolt in Georgia which had important economic consequences of a different kind. The withdrawal of the Allies after intervention had left a Menshevik Govt. in Georgia which country by the accident of its position controlled the pipe line from the Baku oilfields to Batoum. The revolt in Georgia answered the question whether Russia or Western European powers were to control directly or indirectly the South Caucasian oilfields. On Feb. 16 Tiflis was seized by the revolutionaries. On March 19, the revolutionaries now helped by the Russians, were in Batoum.<sup>1</sup> Baku oil was later on to be one of Russia's most important exports, as it had been before the War.

*The Famine of 1921.*—The extreme drought of the summer of 1921 affected districts that should normally have been granaries for the rest of Russia. The long series of rainless months turned the Volga country into a desert with neither food for man nor fodder for beasts. The people crowded to the river banks and died there. Women fought for scraps of horse dung and cooked them in the contaminated water of the Volga to postpone their children's deaths. The starving population had no strength to resist the ravages of typhus. Fridtjof Nansen, the American Relief Administration, the Quakers and others, organised assistance to the starving districts (see RELIEF). The Russian Govt. had to face not only a complete failure of its plan of obtaining corn by exchange, but also a big reduction in the corn tax which, even in the original plan, was less than their needs. They were unable to supply the factories with the grain they needed for their workmen. They were forced to buy grain where they could, and to buy that grain for money. "We had to grab at the straw of what value was left in the Soviet paper roubles."

*Saving the Rouble.*—It was clear that the rouble, which had been rapidly dying, and was already a very ghost-like thing, could no longer be considered as a parting guest to be speeded on its way, but had to be saved at all costs. Factories for a time paid their workmen in factory products which the workmen sold on the market and with the resulting money bought bread. It was obvious that the only hope of lasting salvation lay in a stable currency. A stable currency demanded a balanced budget and a stoppage of the printing press, on the activity of which in producing paper money faster than it became valueless the very existence of the State depended. This meant that factories must pay for themselves. Lenin told the party that they "must learn to trade." The State was forced to compete in buying. It must also compete in selling, with the private person. No longer were railway tickets to be free and unobtainable, electric light free and without lamps, trams free and not running. Everything had to pay for itself and so be paid for by whoever used it. Free trade of all kinds was legalised within the country.

*Revival of Private Enterprise.*—The streets of the towns began to change their appearance in the summer of 1921. Shutters came down from the closed shops and behind the broken and patched windows appeared all kinds of secreted ancient stores. Inessential things appeared first, because it had been easier to keep them hid. Toyshops were among the first to open, together with hat shops, and it was possible to buy cosmetics in old boxes with faded labels long before it was possible to buy the saucepans and kettles and clothes that were really wanted. Private bookshops sprang up in all directions. Private restaurants opened, where better meals could be obtained by those who could afford to pay for them than at any of the State refectories which continued to function. Pedlars flourished exceedingly, no longer slinking round corners out of sight of the militia. The State retained the monopoly of foreign trade, heavy industry and much light industry. But heavy industry was run at a loss, light industry was producing only a very small proportion of its pre-War

output, and though there were plenty of shops belonging to co-operatives and to the State, and though the private shops were handicapped by high rents and high taxes, it seemed to the outside observer that in the competition between the State and private enterprise, the State would go to the wall. The new conditions benefited the peasantry, whose discontent with the Soviet Govt. grew rapidly less. They benefited the large class of persons who had previously made a surreptitious living by buying cheap and selling dear when both operations were forbidden. Their beneficial effects were felt later by the workmen, and the new conditions were for some time actually injurious to the large mass of small Government officials, who had not time for trading in their off hours and soon found themselves compelled to pay rent for their rooms, and to buy their food instead of having the necessities of life provided free. Both in town and village this new economic policy ended the process of social levelling and started a new process of differentiation into classes.

To people both within and without the Communist party, who had identified "Communism" with the economic methods of the civil war, these changes seemed to prove that the revolution had changed its mind. Outside the Communist party and particularly outside Russia, it was assumed that Russia would rapidly "drift back to capitalism." Inside the party among the rank and file there was a feeling that everything they had risked their lives for had been abandoned. Once more rich men were driving in cabs while poor men walked, rich men were fat while poor were thin. Lenin himself had none of this feeling of defeat. Intervention had ended, and he was returning to the plans that it had interrupted. But for his prestige it is doubtful whether the party could have stood the shock of this sudden change of course. Later, as the party learnt to adapt itself to new conditions and saw the effect of those conditions in a rising standard of life and in Russia's economic recovery a new hopefulness took the place of the old fanatic enthusiasm. But, from the beginning of the new economic policy, there existed ground for disagreements on questions of principle more serious than any of the disagreements on questions of tactics which had accompanied the period 1917-20.

In the ensuing period the history of the Revolution is not one of startling events but of slow processes, a long struggle between state and private industry and trade, a gradual development of diplomatic relations between Russia and the rest of the world, a series of debates in the Communist party, reflecting the new tensions and readjustments due to changes not only in Russia but outside.

The year 1922 found the Soviet Govt. with a programme that included the establishment of a stable currency, a pruning of state apparatus, complete legalisation of free trade within the country and the renting out of some of the nationalised factories, etc., to private persons and co-operatives. All these planned measures aimed at the economic recovery of Russia, that is to say, at putting Russia's town population in a position to satisfy by import or by manufacture the needs of Russia's peasantry. It was hoped further to bribe foreign capital to help in the economic development of Russia by giving concessions of a kind which while allowing the concessionaire to enrich himself, should on the expiry of a definite period leave the State the richer by technically equipped and going concerns. None of this programme had anything in it shocking to the western world, and, if that had been all, there would have been no difficulty in the way of securing every kind of co-operation from western Governments and capitalists.

*The Third International.*—But the Soviet Govt. was an expression not only of Russia but of the Communist party, and the very nature of that party implied a further programme. It had created the Soviet Govt.; it had also created the Communist International. If the programme of the Soviet Govt. was a national programme, that of the International was one of international revolution. Founded in 1919, the Communist International was intended to unite and strengthen Communist parties in all countries. It sought to make itself a supreme general staff for all its members. It aroused greater anxiety in its

<sup>1</sup> The Turkish Treaty of March 16 provided that Batoum was to be ceded to Georgia under conditions of local autonomy.

opponents than any previous international revolutionary association, because it had its headquarters in a revolutionary country, though its attempts to enforce the strict discipline learnt by 20 years of struggle in Russia on the parties of countries which were less afraid of freedom of opinion, led to many schisms and quarrels in those parties. Still, its very existence served as a reminder to foreign Governments that Russia's revised economic programme did not alter the fact that the ruling party in Russia had by no means abandoned its revolutionary aims. At the same time countries with colonies in the East were unpleasantly aware that Russia's policy of ostentatious disinterestedness tended to make oriental nations conscious of a contrast between Russia and countries with large interests in the East which they were unwilling to give up. Russia's policy tended to increase nationalist feeling in all subject countries. In the East, Russia, apparently renouncing claims for material advantages, had actually become more dangerous to the position of western countries there than had been the old grasping Empire of the Tsars. (See THIRD INTERNATIONAL.)

*The Genoa and Hague Conferences.*—Economics and politics accordingly became contradictory motives reacting in positive and negative fashion on the re-establishment of Russia's relations with foreign countries. These motives were illustrated in the conferences of Genoa (*q.v.*) and The Hague (*q.v.*). At Cannes, Mr. Lloyd George had declared the impossibility of the recovery of Western Europe without Eastern Europe. On April 10 1922, Russia met the other powers in conference at Genoa. The French insisted that nothing should be done that could in any way affect the Versailles Treaty. It was stated that the recognition of Russia's foreign debt must be a starting point for any fruitful debate. Thereupon Germany and Russia came to a separate agreement in the Rapallo Treaty (*q.v.*) signed on April 16. Germany and Russia mutually cleaned their slates. Germany gave up all claims for damage done by Russia to German interests inside Russia, unless in the future Russia were to satisfy claims of this kind made by other States. Diplomatic relations were fully resumed. The treaty included a "most favoured nation" clause, subject to a limitation in favour of countries that had been part of the old Russian Empire, of Soviet Republics and of Asiatic states bordering on Russia. The German Govt. declared its readiness to facilitate agreements with Russia made by private firms. This agreement led to the exclusion of Germany from further discussions of the Russian question at the conference in order to calm the French, who declared that they saw in Rapallo an attack on Versailles. The Genoa conference closed on May 19 without further result, excepting an agreement that there should be no aggressive acts on the part of Russia or of any of the Governments taking part in the conference for four months after the close of discussions.

A non-Russian commission was appointed, and Russia was invited to appoint a Russian Commission, both to meet at The Hague on June 26 to consider the questions of debts, foreign property sequestered in Russia and credits. At this further conference, Russia was ready to agree (1) not to ask for compensation for damage caused by intervention and the blockade; (2) to recognise pre-War debts, without the addition of accumulated interest; and (3) to satisfy foreign ex-owners of confiscated property by giving them in preference their former undertakings as concessions. After much fruitless debate in sub-commission the Russians asked for a plenary sitting. They were told that a plenary sitting would be held to consider any further proposals they might have to make. It was held on July 19, and brought the conference to an end. A suggestion made by Litvinov for a new formula on compensation to foreigners for property nationalised led only to a misunderstanding. Neither side was ready to recede from its position, the one being unwilling to undertake obligations that would cripple its efforts towards economic recovery, the other believing that Russia's economic position was so bad that time would bring about a capitulation not merely on financial questions.

*The New Currency.*—In the meantime the Soviet Govt. were proceeding slowly with the realisation of their internal pro-

gramme. They printed (according to decree of Oct. 11 1922) banknotes with a definite cover in gold, foreign currency and foreign securities. These remained stable side by side with the rapidly soaring paper currency<sup>1</sup> in which the bank notes were quoted day by day. Prices were given in gold roubles, represented by the banknotes (a *tchervonetz* equals 10 gold roubles), and were translated into terms of the ordinary paper roubles. Gradually the paper came to be used exclusively as small change was replaced by smaller notes with similar cover (decree of Feb. 5 1924) and was finally withdrawn from circulation. It became possible at last to issue a silver coinage of values from a rouble down to ten kopecks and copper coinage of values from five to one kopeck. The years 1922-4 saw a rapid reduction in the amount of the deficit that had to be made up by emissions of paper roubles, and the existence of the stable *tchervonetz* side by side with the unstable Soviet rouble made possible an increasing normality in trade long before the stabilisation of the currency as a whole. This process of stabilisation lasted from 1922 to 1924, when the Soviet roubles were finally withdrawn.

*Organisation of Industry.*—The restoration of the currency was accompanied by, was dependent on and itself assisted radical changes in the organisation of industry. If Russia were to have a stable currency she could no longer afford to leave costs out of account and to make up for industries run at a loss by printing paper roubles. Industry had to be put strictly on a basis of profit and loss. The first step was to distinguish between paying and non-paying industries, the second to make industries themselves interested in their own successful working. The unwieldy mass of moribund nationalised industry was split into sections called trusts and allowed a certain amount of liberty. At first they were free to do what they could with all surplus production over the amount that corresponded to the amounts of raw material, etc., supplied to them by the State. It presently appeared that the State could not supply them with raw materials, so that they were compelled to supply themselves, thereby to a very large extent becoming independent in their operations and called on by the State to account only for their results. These organisations were financed by the banks, all of which were in the hands of the State. The flax trust was the first of these organisations. It was soon followed by the timber trusts, textile trusts, tobacco trusts, etc. The co-operatives, similarly dependent on credit from the State and similarly independent in their operations, became huge trading concerns, buying in Russia and selling abroad, and buying abroad and selling in Russia under the State monopoly. In the first year after the introduction of the new economic policy production in Russia increased by approximately 46% (Oct. 1921 to Oct. 1922). In the second year production was 44% higher than in the first year. Russian exports and imports which had fallen to nil during the blockade and the civil war rose in the year 1922-3 to 9% and 12% of her exports and imports in 1913. In 1923-4, export had risen to 24% and import to 16% of its value in 1913.

In 1923 Russia exported 170,000,000 poods of corn, as against 40,000,000 in the preceding season. Consciousness of the beginning of economic recovery and anxiety lest that recovery should be jeopardised by any worsening of her international relations, dictated her attitude in the first political crisis of that year and in the second showed that it might come into collision with the revolutionary interests of the Communist party. The first crisis was brought about by a British threat to annul the Trade Agreement, the second by a mistaken belief in the imminence of further revolution in Germany.

*Relations with Great Britain.*—On May 8 1923, Lord Curzon sent an ultimatum to the Soviet Govt. (which in Dec. 1922 had become the Government of the Union of Socialist Soviet Republics) in which he referred to anti-British propaganda and demanded the withdrawal of certain Russian diplomatic representatives in Persia and Afghanistan, recognition of the three-

<sup>1</sup> Thus on May 5 1923 one *tchervonetz* was worth 485 roubles of the 1923 issue and on Aug. 28 it was worth 1,850 such roubles. A rouble of 1923 was worth 100 of the 1922 roubles, which were each the equivalent of 1,000,000 roubles of any previous issue.

mile limit in territorial waters, compensation for trawlers seized and accidentally sunk when found fishing within the twelve-mile limit which the Russians claimed, and compensation for an Englishwoman who had been imprisoned and an Englishman who had been killed in Russia, together with the withdrawal of a note in which a minor official of the Russian Commissariat for Foreign Affairs had referred to the imprisonment of Irishmen in English prisons in answer to a note from the British Commissioner in Moscow on the subject of a Russian espionage trial. In the event of non-compliance with these demands the Soviet Govt. was threatened with an immediate rupture of Anglo-Russian relations, which for two years had been those outlined in the Trade Agreement of March 1921. The Soviet Govt. replied in terms which, while not accepting all the English demands, made rupture extremely difficult, and the conflict was abandoned after a Russian note of July 18.<sup>1</sup>

On May 10 two days after the delivery of the Curzon ultimatum, Vorovsky, who had gone to Lausanne as Russian representative to attend the conference that was among other things settling the future of the Dardanelles (in which it was recognised that Russia was interested), was murdered by a certain Conradi. It was felt in Russia that the lack of precautions taken by the Swiss police to protect a man who, though not a fully accredited delegate, had yet received a Swiss diplomatic visé on his diplomatic passport was a reflection of the hostile attitude of the Great Powers. In this way the murder of Vorovsky was connected in the Russian mind with the Curzon ultimatum. A street in Moscow in which many of the foreign missions live was renamed after Vorovsky. Just as, during our own Cromwellian revolution England protested in vain when English Whites in Holland killed a representative of the Commonwealth, so Russia's protests to the Swiss Govt. did not prevent the acquittal of Vorovsky's murderer, in spite of his admitted guilt. All Swiss subjects with the exception of workmen and old residents were expelled from Russia, trade with Switzerland was prohibited, and it was announced that until satisfaction had been given Russia would send no diplomatic or trade representatives to that country. The convention concerning the Dardanelles was eventually signed by a Russian representative in Rome. This convention, against Russian wishes, opened the Straits to warships, whereas before the War, against Russian wishes, the Straits had been closed to them.

*Russia's Relations with the East.*—Within a few days of their taking power, the Soviet Govt. foreshadowed the character of their Eastern policy in a declaration to "The Mussulmans of Russia and the East," issued on Nov. 22 1917. That policy differs from that of the old Russian Empire and from that of Western powers in its ostentatious refusal of all privileges (capitulations, for example) and its insistence that relations between Russia and Eastern nations are relations between equals. It is a policy that makes more difficult the traditional Eastern policy of Western nations, who have been accustomed to treat the Eastern nations, with the exception of Japan, as races on a lower level of civilisation than themselves. The first practical illustration of this policy was given on Jan. 27 1918 in a note from Trotsky, then Commissar of Foreign Affairs, to the Persian Chargé d'Affaires in Petrograd, denouncing the Anglo-Russian treaty of 1907, which divided Persia into British and Russian spheres of influence. A treaty between Russia and Persia was signed on Feb. 26 1921. On May 27 1919 a Russian declaration recognised the sovereign rights of Afghanistan, and by the end of that year there was a Russian envoy in Cabul and an Afghan envoy in Moscow. A Russo-Afghan treaty was signed on Feb. 28 1921,<sup>2</sup> and friendly relations have in general continued, despite some mutual exasperation when Afghanistan sheltered the forces of the deposed Emir of Bokhara and gave at least moral support to Enver Pasha in his attempt to create a Pan-Islamic movement in Bokhara. Both in Persia and in Afghanistan Russian policy came into conflict with British.

Turkey was one of the signatories to the Brest peace whereby she gained considerable Russian territory, and though a Turkish envoy accompanied Count Mirbach to Moscow in 1918, Russia's relations with Turkey were those of a defeated country with a vassal of the conqueror until after the Peace of Sèvres, the dispersal of the Turkish Parliament by the Allies and the formation of the new Turkish Govt. at Angora. Early in 1920 an emissary from Angora (Halil Pasha) reached Moscow, and by Nov. of that year there was a Russian mission in Angora and a Turkish Ambassador had been appointed, though he did not reach Moscow till early in 1921. Friendly messages passed throughout the year, and on March 16 1921 a Russo-Turkish treaty was signed, by which Russia, in accordance with her general Eastern policy, renounced the capitulations and further renounced all claim to the payment of Turkish debts. On Jan. 2 1922 a treaty was signed between Turkey and the Soviet Govt. of the Ukraine, and on July 9 1922 a railway, post and telegraph convention was concluded between Turkey on the one hand and the R.S.F.S.R. and the Trans-Caucasian Republics on the other.<sup>3</sup>

From April 5 1918 till Oct. 25 1922 there were Japanese troops in Vladivostok. During the period of intervention, Japanese troops pushed far inland, and until May 15 1925 the Japanese retained northern Sakhalin, which they had seized pending satisfaction for the Nikolaievsk massacre. When the Russian Red Army reached Irkutsk, early in 1920, Japan had proposed the setting up of a buffer state, and the Far Eastern Republic was created, which, however, instead of falling under Japanese influence, remained closely tied to Moscow and eventually, after the withdrawal of Japanese troops from the continent, was declared a Soviet Republic by a Constituent Assembly. Negotiations initiated in the autumn of 1922 broke down, but Nikolaievsk was evacuated by the Japanese on Sept. 27, and the Maritime Province on Oct. 25. On Feb. 4 1923, M. Joffre was invited from Peking to Tokyo by Viscount Goto, and there were official negotiations from June 28 to July 31 of that year which were without concrete results. The Japanese earthquake and the refusal by the Japanese Govt. of assistance offered by Russia to Japanese "workers" marked the beginning of a new period of hostility on the part of Japan, but the Japanese elections of May 1924 and possibly the American Immigration Act of that month brought about a change of Government and a renewal of negotiations. These resulted in the Russo-Japanese Treaty of Jan. 20 1925 signed at Peking, which came into force on Feb. 26. (For the terms see JAPAN, section *Relations with Russia*.) In accordance with this agreement the Japanese evacuated North Sakhalin on May 15 1925.

Soviet Russia's relations with Japan are the same in character as the relations with the big Western powers. Her relations with China illustrate her policy towards "oppressed" as distinguished from "exploiting" nations. On July 26 1921 the Soviet Govt. informed the Chinese Govt. that Russia would not in future require payments on account of the Boxer Indemnity of 1900, and renounced all special privileges in China. A treaty between Russia and China was delayed by the influence of the Western Powers in China, by minor conflicts and by changes in Chinese administration. A treaty was finally signed in Peking on May 31 1924. At the same time an agreement was signed concerning the Chinese Eastern Railway establishing the equality of Russia and China in the management of the railway, abolishing the extra territorial rights of the railway and putting it under the protection of Chinese soldiery. This agreement could not be put into practice for some months because Marshal Chang Tso Lin, commanding in Manchuria did not recognise the authority of the Peking Government. With that Government's approval a separate agreement to the same effect was signed by Russia and Chang Tso Lin at Mukden on Sept. 20 1924. There have been several conflicts concerning the railway, of which the most serious was that of Jan. 1926. (See CHINA; CHINESE EASTERN RAILWAY.)

<sup>2</sup> Translation of the texts in *Manchester Guardian* of March 31 1921 and *L'Europe Nouvelle* of May 28 1921.

<sup>3</sup> For details of these treaties see A. J. Toynbee, *Survey of International Affairs*. At the same time (March 1) a Turkish-Afghan treaty was signed in Moscow.

*Expectation of Revolution in Germany.*—In the autumn of 1923 the Russian Communist leaders believed that there would be a revolution in Germany, as a result of the occupation of the Ruhr and the Separatist intrigues in the Rhineland, which accentuated the economic crisis in Germany. They expected that Poland and France or Poland alone, would attack the German revolution, and the Soviet Govt. sent Victor Kopp as plenipotentiary to seek an arrangement with the countries lying between Russia and Germany, whereby Russia should be able to send corn to Germany, no matter what German Govt. should be in power. The Communists could not have remained indifferent if an attempt had been made to blockade a revolutionary Germany and, being extremely anxious to avoid war, hoped in this way to be able to make such a blockade ineffective without being themselves drawn into an armed struggle. Some of their small western neighbours were glad of even this frail guarantee of peace, but nothing was actually signed, and the motive for seeking such an agreement was removed when the expected day came and there was no German revolution. From that moment the Soviet Govt. began to build alike its external and internal policy upon a belief that for a very much longer period than it had at first anticipated it would be the only Communist Govt. in Europe. There had been a feeling in the minds of the masses that N.E.P. (New Economic Policy) would be thrown overboard as soon as a German revolution made it possible to exchange Russian corn for German goods in an economically independent, self-contained Socialist world. N.E.P. now gathered an atmosphere of permanency, and was henceforward more confidently developed.

*Economic Recovery.*—Although in Lenin's mind it had always been the policy of a prolonged period, the phrases used in introducing it ("retreat", "a manoeuvre" and "outflanking") had delayed its acceptance as such. For some time revolutionary hopes and doubts were reflected in alternating moods of repression and of exultation in the growing commercial activity of the towns. For some time minor authorities were not quite clear as to what was and what was not allowed by the new economic policy. Private traders who were too successful found themselves welcomed by the State trusts anxious to sell them goods, arrested as if at haphazard by the administrative authorities, and heavily taxed by those who had charge of the State finances. As one of them put it: "There was sunshine in the morning, but thunder in the air, and you never knew when you would have to take shelter from a downpour." It was only after the definite political stabilisation of Germany that they began to lose this feeling of precariousness. On the other hand they were enjoying a freedom they had not known under the civil war, the rewards were large, and in spite of the way in which the State weighted the scales against them and in its own favour they were extremely active. It was a long time before the State shops could outlive the bureaucratic manners of the period of militant communism. It was for a long time pleasanter and quicker to buy things from a private trader than from a State shop or a co-operative store, and the State had to learn that not in industry alone is it necessary to provide the stimulus of personal interest. But the machine, though at first those of its wheels creaked in which the State was particularly interested, began to move with increasing speed. The measures introduced as a concession to the peasantry were resulting in an extraordinary resuscitation of the towns. As early as 1923 the streets were full of jostling, hurrying crowds, and impartial observers were of the opinion that a stoppage of the New Economic Policy was beyond the power of the Communists even if they had wished it.

Increasing activity in the towns, rapid growth of the tilled areas in the country, and the economic recovery of Russia in general were accompanied naturally by a series of growing pains. The first of these was a crisis which from an image used by Trotsky came to be known as the crisis of the "scissors." The two blades of the scissors represented the prices of agricultural products and the price of manufactured goods. At one time during the civil war a peasant could get a grand piano from its starving owners in exchange for a few sacks of potatoes. With the new economic policy there came about a sharp change.

Agricultural products became very cheap and manufactured goods very dear, so dear indeed that the peasants could not afford to buy them. Part of the high price of goods was due to the enormous overhead cost of distribution through the co-operative organisations, part to high cost of organisation, low productivity of labour, etc., etc., and to the new anxiety of the State Trusts to show profit, which led them to screw up the price of goods instead of reducing the cost of their manufacture. The result was a market crisis, in which goods remained unsold in the factories. The Communists were threatened with a rapid growth of private trade unless they could reduce the overhead costs of sale, and with a stoppage of factories unless they could bring about a closing of the scissors—a lessening of the unequal balance between prices of corn and of manufactured goods. At the same time the country was in the throes of its struggle to stabilise the currency, so that there was a shortage of money which resulted in very natural strikes by workmen who had not been paid their wages. The most serious effect of the crisis was a loss of faith on the part of the peasantry, who felt very keenly that they were being exploited by the towns.

*Party Dissensions.*—These growing pains were reflected in discussions within the Communist party. It seemed to some of the Communists that the result of the New Economic Policy had been to turn the State apparatus into a capitalist organisation, whose interests were no longer those of the working class. The trade unions had already ceased to be part of that apparatus, and had returned to the task of defending the interests of the workers against their employers, whether those were private persons or state trusts, but this did not prevent the formation of two surreptitious groups in the party with a tendency towards syndicalism. These did not include any of the better known leaders. Much more serious for the party was the opposition that appeared in the autumn of 1923, which included members of the Central Committee, and in particular Trotsky. The variety of opinions united in a single block in this opposition was itself a proof that its underlying motives were not those openly put forward and that it reflected a widespread discontent in the ranks. It soon appeared that this opposition questioned the right of permanent leadership that seemed to be claimed by the "old guard." The discussion was used by the "old guard" chiefly to destroy the overwhelming prestige of Trotsky, which, outside the Central Committee, was second only to that of Lenin whereas inside it was never forgotten that Trotsky had only sunk his differences with the party in 1917. Stalin, Zinoviev and Kamenev fell upon Trotsky with great vigour, and were still attacking him when, on Jan. 21 1924, Lenin died.

If Lenin had planned the manner of his dying with the object of preventing his death from shaking the Soviet Govt., he could not have done better than he did. His illness did not take him from the leadership until he had already set the party, the Government and the country on the new road towards Russian economic recovery that the end of the civil war made possible. It took him away for a few months, as it were temporarily, and then allowed him to return. It again removed him and allowed the country to accustom itself for a year to the idea of a Council of People's Commissars over which Lenin did not preside, and the Communist party to the idea of looking for directives to a Central Committee which Lenin no longer personally inspired. If he had died earlier, especially if he had died during the War, there might have been trouble over the succession. As it was, Trotsky had been politically discredited by the Central Committee "just in time," and there was no immediate dispute over the leadership which fell naturally to Stalin, Zinoviev and Kamenev, Rykov taking the part of President of the Council of People's Commissars. At the moment of Lenin's death, when it might have been expected that the position of the party would be shaken, the party was able to throw its gates open to new members from the working class. Many thousands enrolled themselves within a few weeks, and by 1926 the party, which had been reduced to about 400,000 by the purge that accompanied the introduction of the New Economic Policy, had grown to over a million. Lenin died, and it was presently seen that

nothing had happened to weaken the Government. There was a moment of expectation outside Russia, a moment of fear inside Russia among those who had come to look on Lenin's life as a sort of guarantee of Russia's new found stability. Both were unjustified, and within a few weeks it was realised, outside as well as inside Russia, that practically Lenin died not in 1924 but nearly two years earlier, when, in 1922, he had first felt ill.

*Great Britain Recognises the Soviet Govt.*—On Feb. 1 1924, less than a fortnight after Lenin's death, the new Labour Govt. in England signified its recognition of the Soviet Govt. as the *de jure* government of Russia. Italy, Norway, Austria, Greece and Sweden had taken the same step before the end of March. Others followed. Many countries, following the lead of Italy, at once appointed ambassadors. England postponed doing this until outstanding questions should be regulated, and a conference for this purpose was called forthwith. These negotiations, which became the subject of bitter political controversy in England, began in London on April 14. The Russians, as in former negotiations, insisted that the two questions of recognition of debts and the provision of credit for development of the power to pay must be considered together. Meetings between the Russians and the bondholders ended in a deadlock. After extreme difficulty, two agreements between the Governments were signed on Aug. 8—a general agreement, and one on trade and shipping, which provided for the application of the Export Credits Act to trade with Russia. Russia was to continue negotiations with the bondholders, and an agreement with them was to be included in a further treaty and to be a condition on which the British Govt. would be prepared to recommend Parliament to guarantee the interest and sinking fund of a private loan. On Nov. 4 Mr. MacDonald resigned, and the Conservative Govt. that succeeded him did not offer the treaties for consideration by Parliament.<sup>1</sup> The position remained what it had been before the negotiations began. Sir Robert Hodgson in Moscow, and the Russian representative in England were still in 1926, two years after formal recognition of the Soviet Govt., enjoying only the privileges given to *chargés d'affaires*.

*The Economic Position.*—In 1925 Russia was a very different country from the Russia of the politically chaotic period that immediately followed the Feb. revolution of 1917 or from the desperate, starving Russia of the civil war. Both in agriculture and in industry she had recovered a level of productivity only about 30% below the level she had reached before the War. The mist of cross purposes that hung over the visible bustle of the towns had cleared sufficiently to show that the new economic policy had not been a simple retreat towards capitalism, and that Russia's undeniable development had been along lines fundamentally different from those followed by other countries. That difference was much more marked in the towns than in the country. It may be said that the towns in Russia formed islands experimenting in a new economic organisation but surrounded and fertilised by an immense sea of agricultural life which was as yet only very slightly affected by these experiments. No great progress had been made in collective agriculture among the peasants, who, after the general levelling of the revolution, were working exactly as they had worked before it, some showing a tendency to get rich, others becoming impoverished and ready to work for hire instead of for themselves. In the towns, however, were definite signs of the consolidation of a new system, and the fact that the towns controlled export and import gave them an influence in the villages that showed (1926) no signs of diminishing.

<sup>1</sup> During the election campaign which followed the defeat of the Labour Govt. in Great Britain on Oct. 8 1924, there was published (Oct. 24), under a covering letter addressed by a Foreign Office official to Mr. Rakovsky, the Soviet *chargé d'affaires* in London, a provocative letter purporting to be addressed to the central committee of the British Communist party by the Praesidium of the Third International over the signatures of Zinoviev, McManus, and Kuusinen. Its authenticity was denied, but the publication roused national wrath in Great Britain, and the conversations were not renewed. For the official correspondence and the text of the "Zinoviev letter" see A. J. Toynbee, *Survey of International Affairs 1924* (Oxford, 1926). (Ed. E. B.)

In Russian industry the relative proportion of private to State and co-operative industry seemed to be growing less. In the year 1923-4 it was estimated that 76.3% of industry was in the hands of the State and the co-operative organisation. In the year 1924-5, this percentage had increased to 79.3. In trade, whereas in the first six months of 1923 50% was in private hands, and the second six months 34%, in the year 1924-5 only 26% was in private hands, while there was an absolute increase in the trade turnover. Individual interest remains the primary motive of production and trade, in town as in the country, but not many persons are able to live by allowing someone else to use their money for productive trade purposes. Unearned increment is rare. Inheritance is allowed with a scale of high and rapidly increasing death duties. The clash of interests between classes inherent in the ordinary system is present in Russia also, where it is artificially reflected by a conflict of motives between different organisations, mutually independent but subject to partial control by a single centre. Thus, whereas the managers and directors of the trusts are chiefly interested in cheapening and increasing production, the trade unions are chiefly interested in seeing that these objects are not achieved at the expense of the workers employed, while the trading organisations are chiefly interested in preventing high prices from lessening their turnover. The central authority, by controlling credit, can bring pressure to bear on the trusts, while by buying and selling it can influence the market. Rates of pay are for the most part decided by collective treaty under the supervision of the trade unions. Arbitration is used for the settlement of disputes.

*The Economic Crisis of 1925.*—The concentration of industry and trade in the hands of the State gives to economic crises a character differing from that of such crises in other countries. In other countries a crisis in one industry is felt only in a lesser degree by others. In Russia, by affecting import and export, it affects the whole economic body of the State. Since no part of that body is without some sort of contact with the Communist party every such crisis is at once reflected in a conflict of views within the party. Towards the end of 1925 the Communists were faced by the most serious crisis for several years. They had counted, in view of a fair harvest, on being able to buy enough corn from the peasants to increase very largely Russian export. Assuming that they would have this largely increased export they planned a lavish import of machinery, etc., confident that they could afford this without risking the favourable balance of trade which they regarded as essential to the stability of their currency. They gave large orders, undertaking big obligations, their confidence being increased by each month of favourable weather. Then, after the harvest, it appeared that the peasant was in no hurry to sell. His taxes had been lowered. He had no urgent need of money, knew that the Government needed the corn and hoped that the longer he held the higher would be the price. The favourable trade balance vanished. It could be restored only by a sharp cutting down of import and that meant a loss of slowly gained confidence abroad and the slowing down of the tempo of economic recovery at home. Further, obligations had to be met in foreign currency, on the possession of which depended to a large extent the stability of the Russian bank-note. The peasant, straw in his hair and sunflower seed in his mouth, had put a spoke in the wheel of the whole community.

This was the economic crisis that sharpened the dispute in the Communist party with which the year 1925 closed. It united in opposition to the central committee, though with widely different views, some of its members who, by reason of their particular work, felt the crisis most intimately. Kamenev, as president of the Council of Labour and Defence, with an economic report in his hands (that he was now allowed to present to the party congress) was very conscious that the peasant had put a stop to what had promised to be a triumphal, uninterrupted progress. Sokolnikov, responsible for Finance, saw the peasant threatening the stability of the currency. Zinoviev, of the Third International, felt that peasant domination was likely to injure the prestige of the Russian party in the minds of the Communist

parties of Western Europe. The peasant's application of blue pencil to the Soviet Govt.'s export plan raised anew the whole question of the New Economic Policy. There was no question of abandoning that policy. The question was whether, under N.E.P. the Communists were doing enough to ensure that the general progress of the country was in the direction of socialism or were allowing the strengthening of a class which would eventually compel the country to move in the other direction. The question raised was, "Which class of peasants was most profiting by N.E.P.?" The central committee held that there was no need to exaggerate the influence of the rich peasants, who were in a small minority among those fairly well off, who profited by N.E.P. The economic recovery of the country, and particularly the development of industry was the surest means to acquire a dominating influence over the peasantry. The interests of industrial development were paramount in a situation that made it clear that for a long time to come Russia could not expect revolution in any of the big industrial countries. The leaders of the opposition were attacked and discredited in the same way as Trotsky had been attacked and discredited in earlier discussions, and the New Economic Policy received a further confirmation. (A. R.)

**BIBLIOGRAPHY.**—The principal authorities are Russian documents; also files of *Izvestiya* and *Pravda*. A great mass of books on Russian subjects have been published in other languages. The following selection does not pretend to be exhaustive.

#### IV. THE CONSTITUTION

The Constitution of the Union of Soviet Socialist Republics, drawn up on July 26 1923, was confirmed on Jan. 31 1924. This

unites in a single body a number of ethnographically and administratively distinct States with essentially similar constitutions.

**The Congress of Soviets.**—The supreme legislative power rests with the Congress of Soviets, which, when not sitting, delegates that power to an executive committee, made up of the Union Council and the Council of Nationalities. The Union Council is elected by the Congress of Soviets. The Council of Nationalities is made up of five representatives from each of the united and autonomous republics and one each from the autonomous districts. The Executive Committee can veto decrees, etc., passed by its praesidium or by individual congresses of soviets of republics, or their executive committees within the territory of the Union. It is itself responsible only to the Congress of Soviets of the Union. This Congress meets not less than once a year, for which purpose it is elected. In each year there are three sessions of the Executive Committee of the Union. In the intervals between its sessions its authority is delegated to its praesidium of 27 members. The Council of Peoples' Commissars is the executive organ of the central executive committee of the Union. It consists of the President of Council of Peoples' Commissars, vice-presidents and ten peoples' commissars.

**The Separate Republics.**—Each of the republics forming the Union is ruled by its own Congress of Soviets in matters that do not concern the Union as a whole. The Congress of a Republic elects its Central Executive Committee and this in turn its Praesidium and its Council of Peoples' Commissars, to which it admits, for purposes of co-ordination plenipotentiaries of the Union Peoples' Commissars for foreign affairs, military and naval affairs, foreign trade, ways of communication and posts and telegraphs.

**The Franchise.**—Every working citizen, male or female, who has reached the age of 18 has a right to take part in elections to the Soviets unless he or she makes profit out of the use of hired labour, out of religion or out of usury (persons living on interest from capital or dividends), is a member of the one-time ruling house in Russia, has served under the old régime in the police, secret police, or corps of gendarmes, or has been convicted of taking or offering bribes, banditry, espionage, etc. The most elementary form of Soviet is the village soviet, to which, roughly speaking, every 100 electors send one delegate. The village soviets in a rural district (volost) send one representative for every 300 inhabitants to a volost congress of soviets, which meets once a year and elects a volost executive committee, which is the chief authority for that district. A town soviet is made by the election of one member for every 1,000 persons. Town and village soviets unite in a district (ouyezd) congress of soviets, though not on equal terms. The town soviets send one delegate for every 200 electors, whereas the village electors are represented through the volost congresses of soviets, which send one delegate for every 1,000 of the population. The ouyezd congresses elect executive committees, which are the supreme authority over the territory of the ouyezd. The Government Congresses of Soviets, subject only to the supreme organs of the republic, are elected by the town soviets and the ouyezd congresses, the town soviets sending one delegate for every 2,000 electors and the ouyezd congresses one delegate for every 10,000 of the population. These congresses elect executive committees, in whose hands is their authority until the succeeding congress. The Congress of Soviets of a Republic, like the Congress of Soviets of the Union, is elected by the town soviets and the Government congresses of soviets. The town soviets elect one delegate for every 25,000 electors, and the Government congresses one delegate for every 125,000 of the population. The effect of this constitution is to give increasing weight to the voice of the industrial population of the towns in the higher organs of authority while leaving very great freedom to the peasants to conduct things in their own way in the villages. The proportion of Communists in the village soviets is extremely small. In the town soviets it is large. It is larger in the Government congresses than in those of the ouyezds (cantons) and larger again in the congresses of republics or of the Union.

**The Communist Party.**—With the gradual disappearance and break-up of other parties and the certainty that a Communist majority in the Congress of Soviets of the Union and in the Central Executive Committee would invariably support the views put forward by the Communists, public interest in the Congress of Soviets grew less, and interest in the congresses of the Communist party increased. It was clear that what the Communists decided to-day the representative institutions would decree tomorrow. Communist congresses were still held behind closed doors, but their debates were reported at very great length. The mechanism of the Communist party began to be as important as that of the constitution, since, for practical purposes, it was the actual, though not the formal, Govt. of Russia. A congress of the Communist party is attended by delegates from the local branches. It is met by the Central Committee appointed by the previous congress, and hears reports which represent the views of the majority of the Central Committee. It takes these reports as the starting points of its debates. At the end of the debates it passes resolutions which represent compromises between differing views (if such obtain) made with the object of finding formulae that will be supported by votes as nearly unanimous as possible. These resolutions are considered as directives binding upon the Central Committee, which the congress then proceeds to elect. It elects a

Central Committee (63 members with 43 deputies), a central control commission (163 members and a central revisional committee of seven members). (These figures are those of the congress that met at the end of 1925.) Thereafter is held a "plenum" of the Central Committee, together with members of the praesidium of the Central Control commission and the members of the central revisional commission. This "plenum" elects the Political Bureau of nine members with five deputies, the Secretariat of the Central Committee of five members with two deputies, the general secretary of the Central Committee (Stalin, 1926) and an Organising Bureau of eleven members with five deputies. It further appoints the editors of the party newspapers and the representatives of the party newspapers and the representatives of the party in the executive committee of the Third International.

Great efforts are made to preserve unanimity in the Central Committee, and party discipline is extremely strict. A dissenting member of the committee is considered to have infringed discipline if, he presses his views outside the committee without its permission. That permission is usually given before a congress, and it is understood that in the event of those views being rejected by the congress the dissenter will wholeheartedly support whatever other views are accepted. By accumulated prestige, fear of schism, control of publication and control of promotion in the party, the Central Committee is in a very strong position in the party in the matter of obtaining support, the Political Bureau is in a strong position in the committee, while the general secretary has an overwhelmingly strong position in both.

The result is a highly centralised instrument for making political decisions which are reflected in the congresses of Soviets and carried out by the Council of Peoples' Commissars. But this instrument is also used in the reverse way, namely, to obtain a wide understanding and support for all the measures of the Government. Every phase in the Government's activities is debated from top to bottom of the party. No important event or change of policy (foreign or internal) takes place without a series of conferences at which the line of the Central Committee (which controls the Government) is explained and discussed. The rank and file of the party are thus kept in close touch with what is going on over their heads, while through these conferences the feeling of the rank and file is reflected back to the committee, and when this feeling seems at all uncertain studied campaigns of explanation are undertaken. This process is carried further through the part played by the rank and file in non-party organisations (trade unions, soviets, etc.) until behind the decisions of the Central Committee is ranged the whole strength of the party and that of a considerable proportion of the non-party workers. This sort of "democratic centralism" is not something newly worked out, but is a fundamental principle of a party which long before the revolution believed at the same time in mass movement and in highly centralised leadership. (A. R.)

## V. DEFENCE

It is difficult at the present time to obtain entirely accurate statistics of the armed forces of the Union of Socialist Soviet Republics or to gauge their military value. The political isolation of Russia from the rest of Europe precludes many of the normal sources of information. The following outline may, therefore, be only approximately correct.

**Control and Administration.**—The Central Executive Committee, which is virtually the supreme governing body of the Union, exercises its control over the armed forces through the People's Commissariat for Military and Naval Affairs, at the head of which is a Commissar, corresponding to a defence minister. He has under him two assistants and a Revolutionary Military Council, from which depend the Inspector General, the staff (*i.e.*, general staff) and the chiefs of political work and of supply. The Inspector General has under him inspectors for naval affairs and for the air force, cavalry, artillery, etc. There is also a body termed the Commissariat for Labour and National Defence, charged with the duty of co-ordinating all activities in the sphere of national defence, and in that of national economics.

In its essentials, therefore, the Soviet system is, in theory at least, very similar to that of other countries. Its peculiar features are the combination of the three Services, army, navy and air force, under a single head, and the prominence of the political department of the military council, which controls political instruction in the services, watches over the political orthodoxy of the forces and has no counterpart in the military system of other countries. The Political Department has its own troops.

**Terms of Service.**—Compulsory service is in force, and a man's military obligations practically begin at 16 years of age. Between the years of 16 to 18 he has to do preparatory physical training for a period of four weeks or 160 hours, and from 18 to 20 a more advanced

course of "pre-conscription training," lasting 10 weeks. Service with the colours in the regular army is for two years in the infantry, artillery and cavalry, for three years in the air force and for 4½ years in the navy. Men then pass into the reserve, where they remain up to the age of 40. Those who are not required for the regular army do four years' service in the territorial army; three months in the first year and a total of five months in the remaining years. All men over 40 are still liable to service in a form of Landsturm, up to the age of 46. The principle theoretically followed is that only workers, peasants and Cossacks may bear arms in the defence of the Republic, the bourgeoisie to carry out non-combatant duties.

**Man-Power.**—The population of the countries which now acknowledge Soviet rule is approximately 130 millions. The full strength of the annual contingent, after allowing for medical rejections, comes to about 725,000,<sup>1</sup> of which it is estimated that some 400,000 are called up, the remainder being exempted for various reasons. There are, at the present time, probably over 10,000,000 men between the ages of 18 and 31 who have received some form of military training and are available to fill the cadres in the event of a general mobilisation.

**Organisation of the Armed Forces.**—(a) The land forces consist of the regular army, the territorial army, and certain special troops. The first two of these categories correspond generally to the same categories of the British Army, but the special troops of the political department form an entirely exceptional body. Their rôle is that of internal security, the quelling of civil disturbances, the service of frontier guards and coast guards, intelligence, police and escort work. They are under the control of the OGPU, and come under the control of the Military Department only for operations. They are in fact the pillar on which Communist rule rests, and they comprise the staunchest elements of the Communist party.<sup>2</sup> They are organised in regiments, battalions, batteries, etc. on the same lines as regular forces, and include a proportion of armoured cars and aircraft.

For administrative purposes, Russia is divided into eight military districts and two "armies," viz.: the Moscow, Leningrad (St. Petersburg), Western, Volga, Ukraine, North Caucasus, Siberia and Kirghiz military districts, the Independent Caucasus Army and the 1st Turkestan Army. These districts are again subdivided into areas corresponding to the territorial divisions and regiments recruited from them, the authorities in which are responsible for all mobilisation preparations and arrangements.

The highest peace formation is the Corps, of which there are 22. They consist normally of three divisions and Corps troops. These latter include medium artillery, tanks and armoured cars, and a gas regiment. There are 12 cavalry divisions, nine independent cavalry brigades, and 66 infantry divisions (regular and territorial). A cavalry division consists of six regiments and includes 12 guns and nearly 200 machine guns, heavy and light. An infantry division comprises three regiments, each of three battalions, with 48 guns and some 450 automatic weapons. The three regiments of the division are each entirely complete and self-contained with their own mounted scouts, close support artillery, transport, and so forth, so that they can operate independently. One result of this is the very large amount of transport in a division, over 3,000 vehicles and 9,000 animals.

The total peace strength of the land forces is approximately as follows: Regular forces 400,000; territorial forces (including regular cadres) 470,000; special troops (including their reserves) 150,000. In addition, the Milizie (armed constabulary) number 200,000.

(b) **Air Force.**—The Soviet authorities are making great efforts to create a powerful air force. The peace establishment of personnel is about 10,000. The total number of serviceable aeroplanes available is at present probably about 550, organised into between 40 and 50 air squadrons. Squadrons are allotted in peace to the various military districts. In war they would presumably form "army" and "corps" troops.

(c) **Naval Forces.**—The Russian Navy is divided into two main fleets, the Baltic Fleet and Black Sea Fleet, with strengths as follows:—

| Baltic Fleet:—                                    | Black Sea Fleet:—                                   |
|---------------------------------------------------|-----------------------------------------------------|
| 2 battleships, both dating from 1911,             | 2 armoured cruisers,                                |
| 3 cruisers,                                       | 3 gunboats,                                         |
| 2 gunboats,                                       | 3 destroyers,                                       |
| 13 destroyers,                                    | 5 submarines, and small craft (minesweepers, etc.). |
| 8 torpedo boats,                                  |                                                     |
| 9 submarines,                                     |                                                     |
| A number of auxiliary craft (minesweepers, etc.). |                                                     |

The Caspian and Oxus flotillas consist of a few small armed vessels.

<sup>1</sup> The total annual class numbers about 950,000; owing to the huge distances, the lack of up-to-date instructors and other considerations the actual contingent is reduced to the figure indicated above.

<sup>2</sup> The percentage of Communists in the ranks of the army is only about 8 per cent. In the OGPU troops it is much higher; also in the higher command and in certain technical units, *i.e.*, armoured forces.

*Estimate of Efficiency of Soviet Forces.*—It is difficult to arrive at a just appreciation of the actual military value of the Red forces. The chief features of their organisation are the high proportion of cavalry, to which arm great value is attached; the equipment of the smaller formations, such as the regiment, for independent action; the large numbers of automatic weapons; and the preparation made for the use of gas as an offensive weapon. In this deadly branch of modern warfare, it is believed that great progress has been made. To sum up, the Russian Army on paper is very thoroughly organised and appears formidable. On the other hand, no amount of paper organisation will at once remove failings inherent in the national character or disabilities in the economic position of the country. The old Imperial Russian Army suffered from a shortage of educated officers and non-commissioned officers and of skilled technical personnel; in present-day Russia this defect must be far more pronounced. The lack of power to manufacture her requirements in munitions and the backward state of the communications of the country were fatal to Russia's armies in the late War; it can hardly be said that the manufacturing strength of the country has increased under Soviet rule, while the transport system went from bad to worse, though transport was reorganised by Dzerzhinsky and much improved 1923-4. It seems unlikely that discipline and morale are as high as under the old régime. On the whole, therefore, it may be doubted whether the Red forces would be as formidable in the field as they are imposing on paper. But the Bolshevik authorities have brought to a high degree of efficiency a strategical weapon which is often of more value than armies, that of subversive propaganda. The founder of Soviet policy, Lenin, laid down that "the soundest strategy in war is to postpone operations until the moral disintegration of the enemy renders the delivery of the mortal blow both possible and easy." In other words, the army is intended only as a consolidating agency to occupy the ground already won by political propaganda.

*Russia's Defence Problems.*—Russia's chief economical and strategical need has always been a free outlet to the oceans of the world. Her northern shores are ice-bound for a great part of the year; and the Baltic on the west and the Black Sea on the south are closed waters of which other nations control the exits. Only in the far east, at an uneconomical distance from her main centres of population, is an unimpeded outlet to the high seas possible.

On land, Russia's unwieldy size and the poor development of her communications have been serious handicaps to offensive action on her part, but have, on the other hand, always in the end baffled enemies who have sought to invade her. The value of the mounted arm in this country of wide plains and great distances has always been expressed by the high proportion of cavalry in the Russian Army.

The changes brought about by the War on the European frontier of Russia have considerably simplified her defence problem on that side, since she is now bordered by a series of small and comparatively weak States, of which Poland is probably the strongest. The Finnish frontier comes uncomfortably close to the former capital (now Leningrad) and to the naval fortress of Kronstadt, but aggression on the part of Finland is hardly a probable contingency. In the south, the possession by Rumania of the former Russian province of Bessarabia may at some date prove a subject of contention. But the western frontier of Russia certainly lies under no such threat as it did in 1914 from Germany and Austria. On the Caucasus frontier Russia is faced by a much weakened Turkey, with whom, moreover, she at present maintains close relations.

In the east, the activities displayed by the Soviet authorities in endeavouring to extend their influence over Persia, Afghanistan and the Chinese Empire may ultimately bring them into clash with Great Britain on the frontiers of India, or with Japan in Manchuria or China. The Bolsheviks will, however, assuredly seek, for as long as possible, to gain their ends by propaganda and by fostering internal disorders rather than by an open resort to arms.

In conclusion, an important tendency of the present rulers of Russia may be noted, since it may have eventually no small strategical consequences. It is their policy of encouraging amongst the non-Russian races which form part of the Union the creation of national forces; they have even indicated an intention to place the whole of the armed forces on a territorial basis. This is a complete reversal of the Tsarist policy, which was to split up the non-Russians and incorporate them in small proportions in Russian units. The new system obviously has great advantages from the point of view of morale and efficiency; on the other hand, it may make it easier in the future for territories with a non-Russian population to break away from the former Russian Empire.

For the laws regulating military and naval service, see *Izvestia* Sept. 30 1922, March 23 1924, Aug. 8 1923, Sept. 23 1925. The Report on Military and Naval affairs submitted to the 3rd Assembly of the U.S.S.R. is printed in *Izvestia* May 22 1925. See also *Armaments Year Book* (League of Nations, Geneva 1926). (A. P. W.)

## VI. ECONOMIC HISTORY

*Population.*—The population of Russia on Jan. 1 1913, according to the official census figures, was 178,400,000. The population of the separated territories according to calculations dating from the years 1915-9 were as follows:—

|              |                   |
|--------------|-------------------|
| Finland      | 3,368,000         |
| Estonia      | 1,750,000         |
| Latvia       | 2,500,000         |
| Lithuania    | 2,246,000         |
| Poland       | 16,022,000        |
| Kars         | 492,000           |
| Bessarabia   | 2,213,000         |
| <b>Total</b> | <b>28,591,000</b> |

The population of the Union of Socialist Soviet Republics and its principal parts was, in 1924:—

|                         |                    |
|-------------------------|--------------------|
| Russian S.F.S.R.        | 96,700,000         |
| Ukraine S.S.R.          | 27,700,000         |
| White Russian S.S.R.    | 4,200,000          |
| Transcaucasian S.F.S.R. | 5,400,000          |
| Turkoman S.S.R.         | 900,000            |
| Uzbek S.S.R.            | 4,800,000          |
| <b>Total</b>            | <b>139,700,000</b> |

The comparison of these data, which cannot, however, pretend to a great degree of accuracy, shows that in the 10 years the population of the former Russian Empire has not increased. It is very probable that growth had already ceased during the War. It is certain that the population decreased in the period 1918-21 during the civil war and the famine of 1921-2. Increase only began again in 1922.

On the eve of the War the rural population was 86.3% of the whole, the town population 13.7%. According to statistics of 1923 83.6% lived in the country districts, 16.4% in towns. No deductions, however, can be based on these figures as to changes in the distribution of the population between town and country, for during the revolution many villages were changed into towns. These figures notwithstanding, the town population has probably decreased of late years. This is in any case true of large towns.

*Agriculture.*—The most important facts are stated in tabular form in which figures are given for the quinquennium before the War 1909-13; the year of the revolution, 1917; the year 1921, when the Soviet Govt. gave up the policy of war communism in favour of the so-called "new economic policy"; and for the subsequent years as far as 1924.

All the figures in this and the following tables relate to the present territory of the Soviet Union:—

|                                                | 1909-13 | 1917 | 1921 | 1922 | 1923 | 1924 |
|------------------------------------------------|---------|------|------|------|------|------|
| Area sown (in million desyatines)              | 83.1    | 79.4 | 58.3 | 49.3 | 60   | 77.2 |
| Total yield of all cereals (in milliard poods) | 3.9     | 3.4  | 1.7  | 2.2  | 2.8  | 2.8  |
| Wheat                                          | 1.1     | 1.0  | .4   | .4   | .5   | .6   |
| Rye                                            | 1.1     | 1.0  | .6   | .9   | 1.1  | 1.1  |
| Barley                                         | .5      | .4   | .2   | .2   | .3   | .2   |
| Oats                                           | .8      | .7   | .3   | .4   | .9   | .4   |
| Maize                                          | .1      | .1   | .1   | .1   | .1   | .1   |
| Potatoes                                       | 1.2     | 1.1  | 1.3  | 1.4  |      | 1.9  |

The reduction of the area sown went on systematically till 1922. In 1923 the turning point came and the sown area began to increase. In 1925 it was about the same as in pre-War times.

As to the yield of cereals, the lowest figure is for 1921, when the country suffered from the failure of the harvest. 1924 was again a bad year, so, notwithstanding the increase in the area sown, the yield of cereals was the same as in the previous year. The yield of 1925 was almost as much as in pre-War times. The table shows a marked increase during the last five years in the cultivation of potatoes. In regard to crops not shown in the table it should be said that flax, hemp and sugarbeet rose quickly after 1922, but up to 1923 had not attained their pre-War levels. There has been an increase not only in the cultivation of potatoes, but also in that of sunflower for seed.

Cattle-raising also fell off very much in the time of War and revolution. In 1924 the number of horses had not reached the pre-War level. The quantity of other animals had either reached their pre-War numbers or had exceeded them, but it must be admitted that these figures are not entirely trustworthy.

(In thousand heads)

|                                 | 1913   | 1917   | 1921   | 1922   | 1923   | 1924   |
|---------------------------------|--------|--------|--------|--------|--------|--------|
| Number of horses . . . . .      | 31,307 | 15,804 | 18,933 | 15,600 | 20,035 | 23,854 |
| Large horned cattle . . . . .   | 50,284 | 25,648 | 36,817 | 33,031 | 38,567 | 51,420 |
| Smaller horned cattle . . . . . | 83,045 | 44,442 | 49,721 | 40,022 | 56,744 | 78,847 |
| Pigs . . . . .                  | 19,274 | 12,696 | 12,491 | 7,637  | 9,105  | 17,672 |

**Mining.**—The effects of the War and revolution were even more severe in the mining industry. Its restorations began soon after the introduction of the New Economic Policy, but the results obtained did not in any branch equal pre-War production. The information given before for the period beginning in 1921 refers not to calendar years but to years beginning on Oct. 1 and ending on Sept. 30.

Yield in Million Poods

|                    | 1909-13              | 1917-8  | 1921-2 | 1922-3 | 1923-4 | 1924-5 |
|--------------------|----------------------|---------|--------|--------|--------|--------|
| Oil . . . . .      | 547.6                | 422.6   | 276.1  | 315.4  | 362.9  | 424.2  |
| Coal . . . . .     | 1,771.8 <sup>1</sup> | 1,036.9 | 588.7  | 659.8  | 938    | 956    |
| Iron Ore . . . . . | 429.4                | ..      | 10.9   | 26.1   | 55.7   | 109.1  |

<sup>1</sup> For 1913.

**Industry** also was very much reduced in 1920-1, and before the introduction of the New Economic Policy this, together with the decrease in the productivity of agriculture, was one of the chief causes of the renunciation of the economic methods of war communism. According to the calculations of authoritative economists the production of industry in 1921 only reached 20% of its pre-War level, taking the total of the chief branches. It may not be out of place to call to mind that at this time no markets existed in Soviet Russia, and the small quantity of goods produced by the factories and workshops was divided among consumers according to "cards" and "orders" under a plan worked out by the organs of the Central Government. The numbers of workers in industry in the years 1910-25 do not give a fair picture of the actual extent of production and the increase which has taken place since 1921. This is due first to the fall in the productivity of labour which accompanied the general disorganisation of all economic life, and secondly to the fact that many persons included in the numbers of industrial workers were unemployed in the most difficult years.

Number of Workers in Industry

|                  |           |                        |           |
|------------------|-----------|------------------------|-----------|
| 1913 . . . . .   | 1,889,000 | 1923-4 . . . . .       | 1,263,000 |
| 1921-2 . . . . . | 829,000   | 1924-5 . . . . .       | 1,493,000 |
| 1922-3 . . . . . | 1,120,000 | 1925 (end of the year) | 1,828,000 |

Production (in million poods<sup>1</sup>)

|                          | 1909-13 <sup>2</sup> | 1921-2 | 1922-3 | 1923-4 | 1924-5 |
|--------------------------|----------------------|--------|--------|--------|--------|
| Cast Iron . . . . .      | 233.6                | 10.6   | 18.3   | 40.1   | 70.6   |
| Iron and Steel . . . . . | 204.6                | 19.3   | 36.0   | 60.1   | 113.2  |

<sup>1</sup> A pood is 36 lb. or roughly  $\frac{1}{16}$  of a ton.

<sup>2</sup> The data refer to the territory of the former Russian Empire, i.e., they include the production of Poland, about 10% of the whole.

In order to complete the comparison of the present state of production (1923-4-5) with its condition just before the War, it will be useful to quote some calculations of the State General Organising Commission of the autumn of 1925. One of the chief tasks of the Commission was the comparison of present with pre-War data. We will here confine ourselves to percentages. Pre-War production is taken as that of 1913. The data for 1924-5 are still provisional only.

Relation to pre-War Production

|                                       | 1924     | 1925     |
|---------------------------------------|----------|----------|
|                                       | %        | %        |
| Chief cereals . . . . .               | 53.0     | 78.8     |
| Potatoes . . . . .                    | 116.1    | 126.7    |
| Flax . . . . .                        | 94.1     | 115.5    |
| Cotton . . . . .                      | 44.9     | 85.5     |
| Coal . . . . .                        | 54.7     | 54.9     |
| Oil . . . . .                         | (1923-4) | (1924-5) |
| Cotton spinning and weaving . . . . . | 64.0     | 71.7     |
| Sugar . . . . .                       | 35.1     | 65.5     |
|                                       | 23.2     | 35.9     |

**Foreign Trade.**—The foreign trade of the Soviet Union almost disappeared during the civil war and so far is still much below the pre-War level. The statistics quoted below are given as the actual prices for the years before 1914 and for the subsequent years at 1913 prices in millions of gold roubles.

(In millions of gold roubles)

|                   | Imports | Exports | Turnover |
|-------------------|---------|---------|----------|
| 1909-13 . . . . . | 1,139.7 | 1,501.0 | 2,640.7  |
| 1914 . . . . .    | 1,098.0 | 956.1   | 2,054.1  |
| 1915 . . . . .    | 1,138.6 | 401.8   | 1,540.4  |
| 1916 . . . . .    | 1,716.5 | 476.4   | 2,192.9  |
| 1917 . . . . .    | 1,965.8 | 464.0   | 2,429.8  |
| 1920 . . . . .    | 29.0    | 1.5     | 30.5     |
| 1921 . . . . .    | 210.0   | 20.2    | 230.2    |
| 1922 . . . . .    | 269.8   | 81.6    | 351.4    |
| 1922-3 . . . . .  | 147.9   | 133.3   | 281.2    |
| 1923-4 . . . . .  | 206.8   | 332.9   | 439.7    |
| 1924-5 . . . . .  | 356.1   | 320.2   | 676.3    |

The import and export of commodities under the chief groups are distributed during the last two years as follows:—

(In million roubles at 1913 prices)

|                                                   | 1923-4 |        | 1924-5 |        |
|---------------------------------------------------|--------|--------|--------|--------|
|                                                   | Import | Export | Import | Export |
| Foodstuffs . . . . .                              | 17.5   | 195.2  | 86.    | 104.2  |
| Raw material and half-finished products . . . . . | 126.3  | 136.4  | 156.7  | 213.   |
| Various . . . . .                                 | 63     | 1.3    | 113.4  | 3.0    |
| Total . . . . .                                   | 206.8  | 332.9  | 356.1  | 320.2  |

The large amount of imported foodstuffs in 1924-5 is explained by the bad harvest of that year and the consequent necessity of importing wheat flour to feed the large industrial centres.

The Currency of the Soviet Union is made up of several parts.

(1) Bank-notes issued by the State Bank in a monetary unit called the chervonets.

(2) Treasury notes issued by the Peoples' Commissariat of Finance in a monetary unit called a rouble.

(3) Silver and copper money.

One chervonets is the equivalent of 10 roubles.

Bank-notes are issued in denominations of from one to 25 chervonets; treasury notes in denominations of one rouble, three roubles and five roubles; silver money from 10 kopeks to one rouble; copper money from one kopek to five kopeks (one rouble = 100 kopeks).

Bank-notes must have a minimum cover of bullion and foreign exchange as to 25%, the remainder must be covered by short dated bills and easily realisable commodities. The law has not laid down any obligatory cover for treasury notes. Except, however, for 48,000,000 roubles issued for the redemption of the former paper money in 1924 and for replenishing the state treasury prior to July 1924 all the remaining treasury notes

have been issued through the State bank; e.g., they bear a direct relation to the value of business transactions.

On Jan. 1 1926 the issue of bank-notes amounted to 781,363,600 roubles (the cover consisting of 216,131 roubles' worth of gold and platinum and 48,874,700 roubles' worth of foreign currency, dollars and sterling); 387,737,300 roubles had been issued in the form of treasury notes, 1,419,481,800 roubles in silver coins and 7,623,700 roubles in copper.

*The Budget.*—The state budget for 1924-5 was passed at 2,558,525,934 roubles. The revenue is made up as follows:—

A. Ordinary Receipts:—

|                                    |             |
|------------------------------------|-------------|
| 1. Direct taxes                    | 442,729,000 |
| 2. Indirect taxes                  | 525,500,000 |
| 3. Taxes on transactions           | 100,655,000 |
| 4. Post and telegraph              | 88,400,000  |
| 5. Transport                       | 855,000,000 |
| 6. State property and undertakings | 188,948,000 |
| 7. Other receipts                  | 33,279,406  |

Total ordinary . . . . . 2,234,511,406

B. Extraordinary Receipts:—

|                                 |             |
|---------------------------------|-------------|
| 1. Realisation of state funds   | 23,000,000  |
| 2. Credit operations            | 141,000,000 |
| 3. Receipt from currency issues | 80,000,000  |

Total extraordinary . . . . . 244,000,000

Grand total . . . . . 2,478,511,406

The budget for 1925-6 is not yet passed in its final form. It probably approaches four milliards. Nominally it will exceed the last pre-War budget (1913), which showed as receipts 3,452,577,000 roubles and expenditure 3,382,912 thousand roubles. In reality, however, it is less than the pre-War budget by about one-quarter, if we take into consideration on the one hand the loss of territory and population, on the other the different purchasing power of the rouble in 1913 and 1925.

*The Russian National Debt* (beginning with the loans concluded in 1922) amounted on Jan. 1 1926 to 437,200,000 roubles.

(L. N. Y.)

AGRARIAN POLICY

One of the first decrees of the Soviet Govt. was the decree on lands (Nov. 8 1917) under which private ownership in land was abolished without compensation and private, crown and church estates passed into the hands of the commune and district councils for distribution to the peasants. The decree registered (see POLITICAL HISTORY above) a process which was already in the course of being accomplished. The fundamental law on land socialisation was promulgated on Feb. 19 1918. The abolition of private ownership was strongly confirmed; possession was only granted to those who cultivated by their own labour. No private transaction in land was permissible. Distribution was to be on the basis of the work-power of the family; taking a man as a unit, the work power of women, youths, girls and boys were assessed at .80, .75, .60 and .50 respectively.

*Collective Farming.*—In addition to the distribution to families the law contemplated the grant of land to associations of agricultural labourers, and a scheme was drawn up for the settlement of farming communities. Under the regulations for the Socialist Agrarian Organisation of the Land laid down on Feb. 14 1919 provision was made for the taking over of large model estates, the best conducted estates of the former landowners, which it was obviously bad policy to divide, into Soviet farms, the management of which lay with provincial committees and in some cases directly with the Commissariat for Agriculture in Moscow. The managers were appointed from Moscow, and the interests of the workers were entrusted to a workers' committee on each

farm. The farms leased to the co-operative societies, which by a decree of Sept. 7 1921 were allowed to resume their productive activities without restriction, were run on a similar basis. Further, by an agreement with the Nansen Action in Moscow in 1923, two large estates in the Saratov and Ekaterinoslav Govts. (about 50,000 ac.) were taken over for a period of years by that organisation with the object of demonstrating modern production methods and of assisting the neighbouring peasants by tractor ploughing and harvesting. Similar large scale developments were undertaken on a concession basis by Krupps in the Kuban and by other companies. On both the state and the co-operative farms overhead charges for the supervising personnel tended to be high, and the hired labour expensive, with the result that some enterprises had to be abandoned. The three-shift system of labour which had to be adopted in order to meet the requirement of an eight-hour day entailed heavy expenses. The importance of the maintenance of model and experimental farms in a great agricultural country need not be stressed. The chief mistake in the Soviet farms system seems to have been the policy of excessive centralisation. Other forms of collective farming exist. The law permitted the leasing of land to associations of peasants acting as an *artel* for the purpose of farming, or to rural communes as such, in which case a general scheme of tillage and of rotation was prescribed. Important as these experiments are from the point of view of the development of better methods of cultivation, the improvement of stock and the introduction of modern machinery and methods, they only cover a very small part of the field. The total area occupied by collective farms of various kinds is still only about 5% of the total farmed area.

*Position as Regards 19,800,000 Farms out of 22,700,000—100,200,000 Inhabitants out of 114,200,000—and 41,700,000 Workers out of 45,900,000: 1924-5*

International Labour Office, *Industrial and Labour Information*, vol. xiv., No. 13.

Although the 1917-8 distribution increased the total area of the peasants' holdings in Russia from 70 to 96% of agricultural land, and in Ukraine from 55.5% to 96%, the average increase for each holding was very small. Moreover, it varied from province to province and from district to district with the type of farming, the nature of the soil, and according to the former existence there or not of great estates. In addition, the famine sent into the country many new claimants for land. Redistribution involved the redivision of the existing peasant lands. A final and equitable settlement could hardly be reached in the period of revolution and civil war.
